Mining and Engineering World Index, Vol. 45.

JUYL 1 TO DECEMBER 30, 1916

Articles marked with an asterisk (*) are illustrated.

A

A. W. C. Co., Mo.	300, 472
Accidents from Mistfire and How to Prevent Them	*17
Acetylene—	
Lamp, Double Chamber	*369
Portable Gas Generator	*824
Acid—	
Flotation	317
Prices	Weekly
Proof Lining for Tanks	618
Sulphuric, Big Values In	8
Acme Mg. Co., Kan.	721
Actinic Light Aids Chlorination	*506
Adams Hill, Nev.	*573
Adams, Maxwell, New Flotation Oil from Sage Brush	490
Adams Mine, Ariz.	
26, 639, 811, 924, 1041	1084
Adams-Hicks Mg. Co., Mo.	1126
Adanac Mine, Ont.	477, 811
Addis & Harris Mine, Calif.	968
Adirondack Mg. Co., Mo.	597, 721
Admiral Mg. Co., Wash.	476
Admiralty Zinc Co., Okla.	207, 1008
Adventure Copper Co., Mich.	
117, 342, 431, 470, 680, 806, 970	1087
Adventure Gold Mine, Cal.	159
Afterthought Copper Mfg. Co., Calif.	
159	1005
Ahmeek Mg. Co., Mich.	29, 70, 116, 300, 471, 517, 643, 680, 720, 806, 926
Air Compressors—	
Efficiency of	744
Flexible Disk Valve for	*456
Silver King Coal'n. Co., Utah	*448
Air and Temperature in Deep Mining	284
Airedale Mill, Mo.	118
Ajax Gold Mg. Co., Colo.	
*231, 429, *613	925
Ajo Con. Copper Co., Ariz.	*158
Alameda Mg. Co., Idaho	926, 953
Alaska—	
Antimony Deposits In	618
Boob Creek	66
Chisana-White River District	50
Cosna-Nowitna District	708
Fairbanks, Review of	339
Gold In Willow Creek	593
Kennecott Flotation Plant	821
Mastodon Creek	66
Mine Inspector's Report	1121
Mining In Willow Creek	499
Prince William Sound	840
Review, First Half of 1916	258
Water Power In Southeastern	824
Yukon-Koyukuk District	802
Alaska Crow Creek Mg. Co., Alaska	296
Alaska Engineering Commission	
677, 716	923
Alaska Free Gold Co., Alaska	499
Alaska Gastineau Co., Alaska	296, 923
Alaska Gold Mines Co., Alaska	
151, 421, 160, 467, 546, 551	1038
Alaska Industrial Co., Alaska	1083
Alaska-Juneau Gold Mg. Co., Alaska	19
Alaska Mexican Co., Alaska	507, 671
Alaska Mines Corp., Alaska	802
Alaska Oil & Ref. Co., Alaska	203, 296
Alaska Petroleum & Coal Co., Alaska	296
Alaska Quartz Mine, Calif.	717
Alaska Society Condemns Actions of Delegate In Congress	109
Alaska Tidewater Copper Co., Alaska	1083
Alaska-Treadwell Mg. Co., Alaska	
427, 507, 749	958
Alaska United Gold Mg. Co., Alaska	
507, 671	1083
Alaska-Westover Copper Co., Alaska	427
Albert Beacon Gold Mg. Co., Colo.	68, 842
Alberta Mg. Co., Utah	848
Alberta Mg. & Dev. Co., N. M.	209
Albion Mg. Co., Utah	305
Alcohol, Prices	Weekly
Alderson, Matt W., Mining Possibilities In Colombia, S. A.	*51, *281, *367
Aldrich, Harold W., 2000-Ton Leaching Plant at Anaconda, Mont.	*221
Alexander Group, Nev.	722
Algo Copper Mine, Calif.	159
Algomah Mg. Co., Mich.	461, 680, 844, 927
Algonac Mine, Mich.	342
Algonkian Mg. Co., Ariz.	515
Alice S. Silver-Lead Mine, B. C.	349
Allegheny Mine, Colo.	553
Allen Copper Mine, Calif.	341
Allison Ranch Mine, Calif.	297, 1085
Allen, Glen L., Flotation of Oxidized Ores	137
Allen, W. R.	*790
Allouez Copper Co., Mich.	
343, 430, 517, 596	841

Alloys—

Cerium-Iron	328
From Slag	453
Albright Property, Colo.	205
Alta Con. Co., Utah	1052, 1129
Alta Michigan Mines Co., Utah	33
Alta Tunnel & Transportation Co., Utah	646, 762
Alum. Prices	Weekly
Aluminum—	
From Clay	237
In Spelter	287
Prices	Weekly
Smelting Plant, New	1026
Aluminum Ore Co., Md.	1026
Alunite, British Columbia	149
Alvarado Group, Ariz.	677
Amador Con. Co., Calif.	*230
Amador Star Mine, Calif.	967
Amalgam—	
Hydrostatic	*621
With Self Rotating Agitator	*624
Ambergris Mines Co., Idaho	1006
America and the New Epoch	1115
American Assn. of Engineers	200, 1118
American Chemical Society	336, 465, 838
American Commander Co., Idaho	805
American Dredge Bldg. & Construction Co., Alaska	113, 467
American Electrochemical Soc.	
23, 200, 336	465
American Express Group, S. D.	304
American Flag Mine, Utah	305
American Fork Dev. & Mg. Co., Utah	305
American Institute of Chemical Engineers	293
American Institute of Metals	753
American Institute of Mining Engineers	379, 577, 995, 962, 1001, 1080, 1117
American Iron & Steel Inst.	675
American Magnesite Co., Calif.	678, 1005
American Mining Congress	
197, 581, 629, 701, 775, 837, 879	914
American Sm. & Ref. Co.	376, 495, 507, 586, 574, 918, 955, 958, 1076, 1129
American Zinc, Lead & Sm. Co.	18, 120, 152, 461, 507, 587, 588, 710, 759, 853, 918
Amla Kenneth Co., Okla.	472
Ammonia, Prices	Weekly
Anaconda Copper Co., Mont.	
30, 72, 106, 119, 152, 207, 343, 461, 519, 546, 598, 632, 672, 761, 798, 815, 846, 848, 928, 968, 971, 1009, 1117	1117
Anaconda Copper Co.—	
Earnings	62
Diamond Mine, Mont.	*229
Great Activities	589
Inspiration Absorption	151
Leaching Plant at	*321
Many Improvements In Methods of Operation	286
Analysis—	
Tungsten	55
Zinc	1027
Anchor Mill, Nev.	*1071
Ancho Mine, Cal.	27
Andayer Mg. Co., Kan.	556
Anderson, R. J., Metallurgical Disposal of Flotation Concentrates	57
Andes Copper Co.	586
Andrew Mg. Co., Kan.	555
Andrews Placer Ground, Calif.	966
Angels Deep Mg. Co., Calif.	
553, 801, 925, 967	1005
Angels-Mohawk Co., Calif.	966
Antelope Star Mg. Co., Utah	646, 1011, 1052
Antimony—	
Alaska	618, 965
Bolivia	3
Imports for April Show Increase	97
Prices	Weekly
Antimony King Mine, Nev.	1090
Antoine Iron Mine, Mich.	29, 887
Apex Mg. Co., Ont.	1093
Arc Welding	*133
Arctic Copper Deposits	586
Arizona—	
Asbestos	1030
Calumet & Arizona's Stopping Costs	326
Daily Sampling in Square-Set Mining	*949
Dry Placer Operations, Pimosa	*1
Field Flotation Machines In	866
Good Roads In	830
Mines and Mills In Yavapai	503
Mining and Metallurgical Progress	11
Mining at Johnson	*141
Motor Trucks In	*110
Old Dominion Co.	*43
Reopening Old Mines In	*329
Review, First Half of 1916	*258
San Juan Mine, Graham County	*105
Arizona Butte Mines Co., Ariz.	716
Arizona Central Co., Ariz.	297

Arizona Commercial Co., Ariz.	
290, 461, 514, 546, 750, 882	998
Arizona Copper Co., Ariz.	
*225, 421, 671, 876	1076
Arizona Deep Mg. & Tunnelling Co., Ariz.	297
Arizona Magma Co.'s Operations In	*9
Arizona-Michigan Dev. Co., Ariz.	*142
Arizona Rex Mine, Ariz.	128, 803
Arizona Mine, Ariz.	1041
Arizona Tom Reed Co., Ariz.	67
Argentine, Tungsten	4
Argo Lg. Co., Colo.	925
Argon Gold Mg. & M. Co., Colo.	429
Argonaut Co., Calif.	
205, 469, *833, 843	1123
Argus Mine, Nev.	406
Armstrong, L. K., Columbia Section, American Institute of Mining Engineers	995
Arps Mine, Calif.	842
Arsenic, Prices	Weekly
Asbestos, Arizona	1030
Ashdown Mine, Nev.	888
Ashland Mine, Ore.	645
Aspen, Over the Range in Pitkin County, Colorado	*943
Assay, Tin Ores, Chemical	451
Athens Iron Mine, Mich.	681
Atlanta Mg. Co., Nev.	311, 344, 519, 557, 722
Atlanta Mine, Idaho	642
Atlantic Mines Co., Mont.	750, 845, 958
Atmospheres Deficient in Oxygen	494
Atmospheric Conditions in the Deepest Mines	575
Atolia Mg. Co., Calif.	884, 1045
Aurora Con. Mg. Co., Mo.	845
Aurora Mine, Mich.	117
Austin-Pakota Mine, Nev.	344, 433
Australia, Flotation at Mount Morgan Mine, Queensland	947

B

Babcock Mg. Co., Mo.	118
Badger Hill Mine, Calif.	594, 757
Bag House Dust, Separating Metals from	*661
Bald Butte Mine, Mont.	683
Bald Mountain Mine, Calif.	114
Balliet, Letson—	
Month's Record of a Dreadnaught Drill	544
Saving with New and Modern Rock Drills Over Obsolete	1103
Stockholders' Responsibility	418
Two Kinds of Loyalty from Employees	622
Underground Electric Mines Lighting	1072
Baltic Mine, Mich.	471, 969
Banner Mg. Co., Utah	165, 678, 1085
Bannock Gold Mg. Co., Mont.	475
Barium Chloride, Prices	Weekly
Barnes-King Co., Mont.	
162, 207, 290, 420, 683	957
Barstow Mine, Colo.	1006
Bartlett Mine, Colo.	129, 843
Barytes—	
Manufacture of	954
Producers of Crude	995
Basin Zinc Mines Co., B. C.	76
Batopilas Mg. Co., Mex.	376
Beattie Mountain Mines & Dev. Co., Nev.	*327
Bear Creek Placer Mg. Co., Mont.	31
Beaver Combination Co., Utah	843
Beaver Con. Mines Ltd., Ont.	
76, 168, 588, 603	1114
Beaver Lake Metals Mg. Co., Utah	890
Beck Tunnel, Utah	890
Beebe Mine, Calif.	1123
Beehive Mine, Ariz.	803
Beeson Tungsten Property, Nev.	*496
Belchic, George, Surface Tension of Oil-Water Emulsions—A Flotation Theory	*487
Belgian Kiddies, Ltd.	992
Bell Mine, Calif.	469
Bell Mg. Co., Mo.	432
Bell Mg. Co., Wis.	34
Belmont Mg. Co., Nev.	519, 557
Belorophon Mg. Co., Utah	121, 165, 848
Belt—	
Fastener, Non-Cutting	*1034
Slips, Cost Computer for	*666
Ben Harrison Mine, Ore.	1010
Bendigo Mines Co., Ariz.	114
Bendigo Mines Dev. Co., Calif.	925
Bernard Interests, Alaska	427
Beryllium, Metallurgy of	93
Bethel Mg. Co., Okla.	518
Big Banta Mine, Colo.	679

Big Blue Lead Gravel Mine, Calif.....	341	Buena Vista Co., Calif.....	383	Carbonates, Sulphidizing for Flotation	
Big Cottonwood Bonanza Mine, Utah.....	973	Buena Vista Mine, Mont.....	1989	Treatment.....	946
Big Cottonwood Coal'n. Co., Utah.....	121	Buffalo Mines Ltd., Ont.....	1131	Cardiff Mg. Co., Utah.....	305, 435, 559
Big Cottonwood Con. Co., Utah.....	435, 723, 835	Buffalo New Mexico Mines Co., N. M.....	330	Carissa Mine, Wyo.....	811
Big Creek Mg. Co., Idaho.....	116, 883	Bull Moose Mine, Wis.....	246, 306	Carlisle Mg. Co., N. M.....	120, 599, 1128
Big Drum Mine, Calif.....	883	Bull Moose Mg. Co., Nev.....	345, 433	Carnean & Squires Mg. Co., Mo.....	928
Big Four Exp. Co., Utah.....	890	Bullion Mine, S. D.....	599	Carnation Mine, Nev.....	808, 1026
Big Indian Copper Co., Utah.....	305, 360, 435, 559, 685, 848	Bullion Mg. Co., Colo.....	757	Carp Lake Property, Mich.....	117, 342, 471, 719

PANORAMIC VIEW OF THE PLOMOSA PLACER PROPERTIES, PLOMOSA, ARIZONA.

Successful Dry Placer Operations at Plomosa, Arizona

By WILLIAM L. PLUMMER.

Since 1865 the dry placer gold fields adjacent to Quartzite, Yuma county, Arizona, have been worked with more or less profit, on a small scale, through the medium of native dry washer, pick, drill and "muck-stick." The highest values in this district are found in a natural cement which lies in blanket form, from 4 to 20 ft. in thickness, above the bedrock. From the grass roots to this cement the formation consists of a semi-cemented gravel rich in gold when treated on a large scale, but not of sufficient value to tempt the dry washer, who sinks direct to bedrock, and works only about 4 ft. of the richest cement. Half a yard of gravel a day mined, hoisted from the shaft, hammered by hand to liberate gold from cement, and run through the dry washer, is a high average for one man; and as earnings of from \$10 to \$20 a day were of common occurrence in former years, it is not difficult to realize the richness of these placers. Furthermore, the early workers could not mine with any degree of profit to a depth of more than 20 ft.; for this reason there are vast areas that have not given up any of their virgin value.

Chief among the fields of the Quartzsite district are the Plomosa, La Paz, Middle Camp, Ora Fino and La Cholla.

It is said that between 1865 and early in the seven-

ties over \$7,000,000 in gold passed through La Paz alone, then the Yuma county seat, supporting a population of 4000 placer miners. The old inhabitants say the Plomosa field sent out \$2,000,000. Fabulous sums were gleaned from the gravel by hand, and it was commonly known that great sums still remained in the ground. In spite of this fact no practical means of liberating the gold from gravel on a commercial scale had been discovered until within the last 2 years.

The two essentials to an efficient plan are—First: A mill to save the gold-bearing cement and gravel and reject the non-bearing country rock. Second: A system of dry concentration of great capacity.

A mill embodying the necessary principles was invented by Mitts Quenner, a blacksmith, and used with a battery of native dry-washers in placers at El Boluda, Mexico. Its essentials are a cylindrical drum made up of a series of iron bars and gratings, inside of which revolves a shaft, the same being hung with a number of chain hammers in spiral form. The shafting revolves at about 400 rpm. in one direction, while the drum travels at a much lower speed in the opposite direction. Cement and gravel, fed in at one end of the mill is quickly disintegrated, the fines dropping through the gratings to a bin beneath, while the rock and boulders are thrown out of the opposite end of

PLOMOSA MILL AND POWER PLANT.

the mill after having been thoroughly scoured by the action of the hammers.

The Stebbins Dry Concentrator.

The Stebbins dry concentrator has solved the problem of dry concentration. Its makers guarantee a saving of 95% of all free gold. These tables work on practically the same principle as the wet table; however, instead of using water to lift the gravel, and

60-HP. LIDGERWOOD HOIST FOR SCRAPER LINE.

1 to 12 ft. long, with a capacity of 40 tons an hour, down to machines operated by hand, with a 4-ft. deck.

In the Plomosa district a small experimental plant composed of a Quenner mill and Stebbins concentrator was installed in the fall of 1915; and although this plant did not have the excavating and conveying equipment necessary to operate at a profit, it demonstrated the efficiency of both mill and concentrator.

Plomosa is the scene of great activity at present.

ORIGINAL EXPERIMENTAL PLANT.

HAULING MILL EQUIPMENT BY TRACTOR.

allow the gold to settle behind the riffles, air is used, it being introduced through small slits in the table deck. The gold and middlings travel along the top riffle to a receptacle, the tailings dropping off the lower side of the table.

Stebbins machines are made in sizes ranging from

Here the Yuma Con. Co. is installing a 2000 yd. plant and the Plomosa Placer Properties has nearly completed a plant with a capacity of 1000 yds. The Plomosa field averages 30 ft. from surface to bedrock, and, from prospect holes that have been sunk, engineers estimate the ground will average \$1 a yard in

125-HP. LIDGERWOOD HOIST BEING INSTALLED.

CORRUGATED IRON COOLING TANKS.

gold. One shaft sunk by the Yuma Con. near the Plomosa line averaged \$1.40 a yard for 40 ft., where false bedrock was encountered; at 83 ft. gold-bearing cement was again struck and for 15 ft. the ground averaged between \$3 and \$5 a yard.

Activities at the Yuma camp have been confined more to preparation than to installation. Electric power is to be used there, and a system of railways and cars will bring the gravel to the mill.

The Plomosa Placer Properties has 380 acres, and the plant will be in operation about the first of August.

The New Plant.

Although all of the units of this plant have been in successful operation in different parts of the country, it will be the first plant of its kind bringing together all of these units, and much interest is being manifested pending its completion.

The excavating equipment consists of a Shearer & Mayer drag-line excavator having a capacity of 1000 yds. daily. The mast for this rig is erected on the crest of a hill 75 ft. above the placer ground. The track cable extends from mast head to anchors 700 ft. distant. Thus, a circle of ground some 1400 ft. in diameter is commanded by the 1½ yd. bucket. Cables for the equipment are controlled by a Lidgerwood double-drum hoist, power being furnished by a 125-hp. Bessemer oil engine. The reduction plant is located on grades cut into the hill below the excavator mast. Cement and gravel will be hauled up the track cable and dumped into a bin at the hill's eminence. From this bin the gravel will be fed into a Williams-Quenner 36-hammer mill, the boulders being rejected and carried away by belt conveyor, the fines dropping to a boot below where they will be elevated to a bin feeding a No. 12 Stebbins concentrator with a capacity of 40 tons an hour. Gold, middlings and concentrates from the large table will be re-elevated to a second bin from which they will run over a small finishing table. Tailings will be carried off by a belt conveyor which will dump them within easy reach of a Sauerman drag-line scraper which, in turn, conveys them to a large gully of waste land. This scraper is operated by a Lidgerwood hoist, power being furnished by a 60-hp. Bessemer engine.

For breaking up cemented gravel in the ground a small compressor and power drill will be used.

The plant is being installed under the supervision of A. Maltman, E. M., who has chosen some of the richest ground in the district upon which to commence operations. He estimates the cost of operation at between 15 and 20 cts. a yard; however, he states that the lead-silver concentrates will more than pay operating expenses. The company plans to triple the capacity the coming year, giving it a daily output of 3000 yds.

At a distance of some 1200 ft. from the mill is a placer run about 100 ft. in depth. This run consists of two deposits, an upper strata of 40 ft. of cement

and gravel and a lower strata topped by a false bedrock some 50 ft. in depth. Directly above the bedrock is a 15-ft. layer of rich gold-bearing cement, which averages \$3 and up a yard. The company is planning to sink a double compartment shaft to this cement, drift it out and convey it to the mill by rail, in addition to the regular work of stripping the ground commanded by the drag bucket to the first bedrock.

The eyes of the mining world are on this new district. Much interest is being shown in the outcome of operations there, which bid fair to add another chapter to the history of gold mining, and to open up vast areas of dry placers hitherto dormant, because no

TAKING HOIST TO HILL BY DRAG LINE.

practical method of operating them had heretofore been discovered.

Tungsten and Antimony from Bolivia.—Exports of metals from Bolivia in the last 2 years have been as follows:

	Tons. 1914.	Tons. 1915.
Tungsten	276	499
Antimony	186	13,085
Copper	3,874	17,872
Tin	37,259	39,312
Bismuth	437	568

Bolivia and Peru have been growing in importance as sources of tungsten since the war started. The expansion in antimony and copper in Bolivia, due to the war, is also striking.

What Mines and Mills Buy in Equipment and Supplies.

Some idea of the immensity of the amount of supplies purchased by American mines and works may be had from the report of the Transvaal mines for 1915, which gives an itemized statement of the supplies used and the cost of same. As this amount was consumed almost entirely by the gold mines of that country, and as this production is only approximately 12% greater than the total gold and silver production of the United States, it can readily be seen that the purchase of supplies by other American mines other than gold and silver will bring the total to a sum reaching into the hundred millions.

Here is the list of the Transvaal gold mine requirements:

	Amount.	Value.
Bags		£ 3,614
Belting		125,790
Bolts, nuts, washers and rivets (lbs.)	3,106,664	42,872
Brattice cloth		1,121
Bricks		13,575
Brushware		11,154
Candles (lbs.)	10,710,411	218,867
Carbide (lbs.)	5,705,296	65,168
Castings—(a) Brass		32,581
(b) Iron		75,161
Cement—(a) Casks	1,312	2,057
(b) Bags	97,686	32,662
Charcoal		4,262
Chemicals and assay requisites		167,015
Coal—(a) Smithy (tons)	20,666	27,587
(b) Steam (tons)	1,825,345	947,113
(c) Other (tons)	23,512	20,369
Coke—(a) Imported (tons)	284	2,532
(b) Local (tons)	1,229	5,238
Compressed air (purchased)		319,127
Cyanide (lbs.)	10,312,309	538,366
Disinfectants		16,219
Electrical machinery		208,304
Electric machinery spares		50,780
Electric power and light (purchased)		1,077,886
Explosives—		
(a) Blasting gelatine (cases)	284,872	655,518
(b) Gellignite and gelatine dynamite (cases)	393,617	707,979
(c) Dynamite, No. 1 (cases)	116	199
(d) Dynamite No. 2 and Ligdyn (cases)	2,017	2,857
(e) Other explosives (cases)	365	759
(f) Detonators		49,244
(g) Electric detonators (or electric fuses)		265
(h) Safety fuse		148,754
(i) Lighting torches (Tylsa sticks)		14,865
Fencing and wire netting		2,220
Fodder for stables—Bran, chaff, mealles, forage, etc.		26,949
Foods, etc. (for colored laborers)—		
(a) Beans (lbs.)	5,642,232	31,216
(b) Rice (lbs.)	2,063,253	17,537
(c) Meal (mealles, Kaffir corn, etc. bags)	585,758	311,662
(d) Malt and cereals for beer		20,420
(e) Meat (lbs.)	31,108,055	404,348
(f) Fish (lbs.)	376,323	5,169
(g) Salt (bags)	7,485	2,132
(h) Groceries, coffee, sugar, oil, ghee, molasses, etc.		37,307
(i) Sundry food including bread		208,720
(j) Vegetables		51,882
(k) Medicines, etc.		26,467
(l) Clothing		12,161
Hosing (steam, suction and rock-drill)		69,077
Hand tools (picks, shovels, hammers, etc.)		86,142
Iron—(a) Bar and angle (lbs.)	6,627,972	53,952
(b) Galvanized		11,149
(c) Sheet (lbs.)	126,807	1,567
(d) Pig (lbs.)	348,725	1,804
Lamps and spares		14,257
Lead—(a) Pig (lbs.)	219,462	1,861
(b) Sheet (lbs.)	28,853	532
Lime—(a) White (bags)	534,368	122,751
(b) Blue (bags)	11,777	2,090
Lubricants—(a) Oils		88,400
(b) Grease and tallows		67,806
Machinery and machine tools		250,484
Machinery spares, other than specified		237,833
Mercury (bottles)	3,017	34,435
Metals (anti-friction)		19,598
Mill screenings		20,730
Motor cars and accessories		12,355
Oils, other than lubricating—		
(a) Transformer		2,567
(b) Other		1,294

Oilskin suits		8,560
Paint, tar, driers, etc.		18,157
Paraffin (cases)	34,571	19,509
Petrol (cases)	13,974	13,139
Pipes and pipe fittings		327,247
Rails, crossings, sleepers, etc.		195,540
Rock-drills	1,742	55,980
Rock-drill spares		200,544
Ropes—(a) Wire		114,489
(b) Cotton and manilla		10,444
Screenings, other than mill		5,078
Screws, nails, etc.		22,308
Shoes and dies (lbs.)	15,246,268	159,552
Skips and spares		14,530
Stationary		51,644
Steel—(a) Bar, tool, cast, etc. (lbs.)	1,563,081	20,416
(b) Sheet (lbs.)	11,974,523	108,911
(c) Hand-drill (lbs.)	4,727,171	67,490
(d) Rock-drill (lbs.)	5,718,442	96,319
(e) Other (lbs.)	384,445	4,981
Timber—		
(a) Building material (ceilings, floorings, doors, etc.)		22,350
(b) Oregon pitch plne, etc. (cu. ft)	1,008,314	206,893
(c) Mining poles and round lagging		361,997
(d) Deals (lin. ft.)	2,745,929	93,815
(e) Fuel		757
Tube mill requisites—		
(a) Pebbles and flints		1,099
(b) Liners		49,112
(c) Other requisites		16,150
Trucks and spares		94,431
Waste		11,028
Water (purchased)		144,325
Zinc and zinc discs (lbs.)	8,682,815	234,330
Sundry articles not specified above		223,085
Total value		£10,889,115

Tungsten from the Argentine.

The Hansa Mines, Ltd., in Argentine, can produce about 50 tons per month of tungsten ore, according to U. S. Consul General W. H. Robertson, of Buenos Aires, and until the outbreak of the war the entire output was shipped to Germany. The mine has been largely controlled by German owners reported to be affiliated with the Krupp interests. The total Argentina exports of tungsten ore from 1909 to 1913, inclusive, amounted to 3319 metric tons, of which 3309 tons went to Germany and 10 tons to Great Britain, in 1909 and 1910. Germany in 1912 took 637 tons, with 536 tons in 1913 and 394 tons in 1914. In 1915 the United States became an importer, taking 135 out of a total of 158 exported. To April 1, 1916, the United States took 146 tons. When the war broke out, cutting off the German market, part of the mine's plant closed down reducing production to a limited figure. Now, however, the Hansa Mines are working at full capacity with the announcement that the entire output for 1916 has been contracted for in the United States.

Ferrovanadium Exports Increasing.

Ferrovanadium exports were the largest in March on record, having been 138,718 lbs. or nearly double the monthly export rate for 1915, the record year. Government data show the following as recent ferrovanadium exports in pounds:

	Per month.
January, 1916	44,782
February, 1916	63,065
March, 1916	138,718
1915	840,265
1914	770,079
1913	604,287
	82,188
	70,022
	64,173
	50,351

The rate to April 1, 1916, of 82,188 lbs. per month is at the rate of 986,256 lbs. per year—a large increase over that for 1915, the record year.

Counter-Migration of Pulp and Solution in Cyanidation and Acid Leaching

By BERNARD MACDONALD.*

Since "all sliming" has been adopted as the most desirable condition, generally speaking, to which an ore should be reduced in order to obtain the best results in cyanide treatment, the efforts of metallurgists have been directed largely to the improvement of the plant apparatus, and of the methods previously used for the agitation of the slime and for the separation of the solution from the leached-out "barren" solids in the treated pulp.

The equipment specially instrumental in bringing about these objects consists of a circular diaphragm, water-tight at the sides, open at the top and bottom and supported centrally in the upper portion of the tank. This diaphragm extends vertically down below the pulp level to a certain depth designed to meet conditions, which, for this description, is assumed as 8 ft., and above the pulp level to the height of 2 ft. In this position the diaphragm divides the upper position of the tank into two areas, the annular space between the side of the tank and the diaphragm known as the "agitation circle" and the space inclosed within the diaphragm known as the "separatory area."

The solution and solids in the pulp to be treated may be in any suitable ratio, but for a definite description the usual 2:1 ratio is assumed. In this ratio the pulp contains two parts of solution to one of solids by weight, which gives it a specific gravity of 1.26, or about one and a quarter times the weight of the same volume of water.

In operation the pulp to be treated flows in a continuous stream through a feed pipe which delivers it in the agitation circle 2 or 3 feet below the pulp level where it is merged with the pulp in agitation there.

The agitation of the pulp is effected by the mechanical means peculiar to the Parral tank system.

Four transfer pipes, each 6 in. in diameter, are set at quarter points in the tanks, their lower or intake ends reaching within a few inches of the tank's bottom, and their upper or discharge ends emerging about 4 in. above the pulp level. The discharge ends of these pipes are fitted with tees or ells with their discharge openings directed so as to discharge in the same direction around in the agitation circle. Half-inch pipes connecting with the compressed-air main outside the tank are fixed centrally within the transfer-pipes and terminate in a ball-nozzle-valve at a point about 5 ins. above their lower ends. Compressed air having a pressure of say 10% higher than the static pressure due to the pulp depth in the tank is introduced through this connection into the transfer pipes which are operated as air lifts. In operation the transfer pipes throw continuous streams of pulp,

transferring it from the bottom and delivering it on the top of the tank charge. The spouting force of these streams discharging in the same direction at the surface of the pulp mass in the agitation circle sets up and maintains a rotary flow in the pulp which extends from top to bottom of the tank.

This flow and the continuous withdrawal of the pulp from the bottom of the tank and its redistribution over the surface of the tank charge, gives it the required aeration and keeps its solution and solid constituents in proportionate mixture, a condition which is essential for the effective dissolving out of the metals in the solids.

While the agitation of the pulp is going on in the agitation circle the area within the diaphragm remains absolutely quiet, with the result that the solids settle rapidly out of the contained pulp and sink to the bottom of the tank, there coming within the suction range of the transfer-pipes, they are transferred to the surface where they are carried away in the rotary flow. As the solids settle out of the solution within the diaphragm the clear solution remains in hydrostatic balance with the denser pulp in the agitation circle. The pulp, as above stated, having specific gravity of 1.26, will balance a column of clear solution one and a quarter times its own height. Therefore, the 8-ft. column of pulp outside the diaphragm will raise the clear solution to a height of 10 ft., or 2 ft. above the pulp level in the agitation circle. At the height of 7 ft. 6 ins. on the inside of the diaphragm is fixed an annular launder, into which clear solution rising within the diaphragm overflows continuously. From this launder a pipe conducts the clear solution over the top edge of the tank, and delivers it into the agitation circle of the next tank adjoining where it becomes mixed and agitated with the pulp and is again separated from it as above described.

As the solution is thus migrating from tank to tank in each of which it is mixed and agitated with new pulp flowing in the opposite direction, it dissolves out and takes up the metals contained in the solids and thus becomes richer while the solids become poorer as they pass from tank to tank. When the solution is separated from the head tank of the series it is sent to the precipitation room where the values held by it are precipitated and the solution, now barren, is returned to the tail-end tank of the series, where it begins again its migration through the tank series, repeating the same effect above outlined.

The tail end of each series of treatment tanks consists of two tanks used for the settlement of the pulp and decantation of all the solution possible from

*In *N. & Chem. Engr.*

the pulp before it is discharged to the filter or dump. The equipment of these tanks is similar to the others, but the pulp is received alternately in them, which allows of intermittent settlement, decantation and agitation by which all the solution consistent with flowage is removed from the pulp.

The volume of compressed air consumed in operating the transfer pipes is very small, owing to the fact that the pulp is transferred through them from the bottom to the top of the tank charge under practically hydrostatic balance—a lift of only 4 ins. above the pulp level being required. The volume of the streams of pulp transferred may be regulated to any quantity desirable by the valves on the compressed air pipes.

The method of agitation and the counter-migra-

All-Steel 16-Cubic Foot Union Iron Works Dredge.

A new dredge has been built for the Marysville Dredging Co. by the Union Iron Works Co. of San Francisco. This is an all-steel dredge arranged to dig 70 ft. below the water level and carrying a bank of 20 ft. above the water. It has 16-cu. ft. buckets, all manganese steel; the bucket is of special design having parallel base; this is driven by a chain of all cut-steel gearing with herringbone gears for the intermediate. The introduction of the herringbone gears has eliminated all of the vibration caused by the straight tooth. There are quite a number of new features on this dredge, making a marked improvement over the older

ALL-STEEL, 16-CU. FT., UNION IRON WORKS GOLD DREDGE BUILT FOR MARYSVILLE DREDGING CO.

tion of the pulp and solution above described is applicable and especially advantageous in the leaching of copper ores by sulphuric acid solution. In this treatment of copper ores the methods are analogous, almost identical with cyanidation, except that the solution being acid requires acid proof apparatus for the agitation of the pulp and the manipulation of the solution.

For copper leaching the Parral tanks and all their equipment are made of wood and are unaffected by the acid solutions. The almost complete separation of the metal-laden solution from the leached-out pulp that is possible to make in Parral tanks by the method described, which obviates the necessity of filtering—the most difficult part of acid leaching—makes this method of treatment worthy of the serious consideration of those engaged in the hydrometallurgy of copper ores.

boats. Construction commenced Dec. 27, 1916, and the dredge commenced to operate on May 7, 1916. The total weight of the machinery is over 2000 tons, and the total cost over \$400,000.

Manganese Ore Imports.—Manganese ore imports into the United States in March were 26,212 gross tons against 398 tons in March, 1915. For the first quarter of 1916, they are 51,545 tons or 17,181 tons per month, which compares with the average for 1915 of 26,731 tons per month. For the 9 months ended March 31, 1916, they were 307,382 tons against 158,985 tons and 212,270 tons for the same period in 1915 and 1914.

Minor coinage at the U. S. mints during May amounted to \$716,020. There was no gold or silver coinage.

Notes on the Randsburg Tungsten District, Cal.

By J. NELSON NEVIUS.*

Developments in the tungsten district near Atolia and Randsburg, California, are so rapid that any description is out of date almost before it can reach the public. New finds of more or less importance are of almost daily occurrence and the tungsten-bearing district is being rapidly enlarged. It has outgrown the name Atolia, both geographically and geologically, and is more properly called Randsburg district, after the older and better known mining town. As at present developed the district skirts the base and lower slopes of the mountains in which the Yellow Aster gold mine is situated—Atolia lying to the southeast and Randsburg to the northeast, with a low divide separating the towns which are 7 miles apart. Recent discoveries on the west base of these mountains, about 7 miles west of Randsburg, indicate that important deposits of scheelite occur here under different geologic conditions. No scheelite has been reported from the heart of the mountain, although important discoveries have been made on the property of the Consolidated Mines Co., and to the west of that property in the town of Randsburg.

A Poor Man's Camp.

As most of the veins are very small and the scheelite comes to the surface, conditions favor development by individual effort or by a small group of workers, rather than by development companies. As a sack of scheelite 2 ft. high and 10 ins. in diameter is worth something like \$350, and as such a sack could be obtained in a couple of weeks from a tiny veinlet as thick as a lead pencil—it is individual effort that counts. Discovery of a vein 2 ins. wide starts a stampede. The finding of these tiny veins in rock of the same color requires close personal application, and a pair of thick knee-pads would be a desirable addition to the prospecting outfit!

Placer Deposits.

On the flats below Atolia there has been recovered much scheelite in the form of fair sized nuggets, just as gold nuggets are found in the detritus below a gold-bearing vein. Many of these nuggets are several inches in diameter and more or less rounded, so that the name "the potato patch," has been given to this district.

All through the district small plants have been built to recover scheelite from the surface gravel, and if ample water were available this method would be enormously profitable, for panning tests made in a small frying-pan rarely fail to show small nodules of the heavy scheelite. Samples taken from the loose sand of the wagon road crossing the Sunshine prop-

erty showed several such nodules. Also considerable scheelite is recovered by means of drift-mining, or running drifts along bed-rock beneath the accumulated gravel of the arroyos. Both tungsten and gold are thus recovered.

Geologic Notes.

Very little has been written concerning the geology of tungsten deposits—probably because those on the ground are far more interested in finding the mineral than in finding the why and wherefore of its occurrence. Nevertheless, a careful study of the deposits already opened would reveal information highly useful in searching for other deposits. The following notes are given as mere suggestions obtained from a hurried inspection of several of the producing properties, and they seem to indicate that the scheelite occurs under a variety of conditions in the Randsburg district.

The Atolia deposits are in more or less continuous fissures in a granite, and the scheelite occurs mixed with quartz. The veins are well-defined and the mineral occurs in all degrees of purity, but customarily mixed with more or less quartz. The veins have been followed to a depth of more than 700 ft. on the dip, and in places are 3 ft. or more in width.

North of Atolia, near the summit of the low hills, are some shallow shafts showing the granite cut by very narrow dikes of a basic rock and with seams of scheelite from a knife-edge to 2 ins. wide, occurring irregularly along the sides of the dike. Such a discovery was made on the Margaret E. claim on the day of the writer's visit. Tiny excavations showed a poorly defined basic dike about 10 ins. wide and a seam of fairly pure scheelite nearly 2 ins. wide. Other similar dikes were found nearby running in various directions, and in some of them specimens of scheelite were seen. Openings made subsequently on this property have shown other similar deposits, although it is yet too early to draw definite conclusions. A few hundred feet distant from these discoveries, a belt of limestone outcrops along the slope; and as limestone occurs with, or near, nearly all the deposits visited, there seems to be a distinct connection between the two.

Just west of the Sunshine mine, and on the Sum Dum claim is an outcrop of altered limestone of yellowish color, overlying schist. The limestone is about 10 ft. thick and outcrops boldly for a short distance, and is notable for its mottling of an apple green color, probably due to nickel salts. This limestone contains a small amount of scheelite, which can be concentrated by panning. Several samples were panned and all showed some scheelite, which remained in the pan as a white powder; while one sample, without differing

*Editor Mining and Oil Bulletin, Los Angeles.

in appearance from the others, yielded a teaspoonful of scheelite from a 2-lb. sample.

On the Consolidated Mines property, a 2-ft. vein carrying scheelite was discovered on the surface immediately behind the mill. At the time of discovery this vein appeared to be of the same type as the gold vein of the main mine; being a quartz-filled fissure in granite. This, or other similar veins, have been traced to the westward through the town of Randsburg, and are understood to be now yielding important amounts of tungsten.

Seven miles to the west of Randsburg, and on the extreme west base of the mountain, there have been discovered some important deposits along the contact of altered limestone and overlying schist. At the time of the writer's visit the most important of these was the Jones and Virgin group which had yielded several hundred pounds of high-grade ore from very small surface openings. On this property the scheelite occurs in the metamorphosed limestone, at or near the schist contact. There are other small showings in this region, and the whole matter is well worth careful study, as these discoveries enlarge the possibilities of the district very greatly.

The result of these very brief observations, then, indicates that there are three modes of occurrence of the ore; namely, as a constituent of quartz-filled fissures in granitic rock; associated with small basic dikes in granitic rock; and in the metamorphosed limestone, at or near, contacts.

At the present time this district is producing about half a million dollars worth of scheelite per month.

Big Values in Sulphuric Acid.

The production of sulphuric acid, expressed in terms of 50° acid, in the United States in 1915 was 3,868,152 tons, valued at \$29,869,080, together with 189,795 tons of oleum or fuming acid of different strengths, valued at \$2,787,971, making a total of 4,057,947 tons, valued at \$32,657,051.

These figures, compiled by W. C. Phalen of the Geological Survey, include so-called by-product acid, or acid produced at copper and zinc smelter. The production of acid from this source in 1915 was 1,056,830 tons, expressed in terms of 50° acid, valued at \$7,042,126, together with 59,189 tons of oleum of different strengths, valued at \$579,115.

The production of sulphuric acid in the United States in 1915 by grades in short tons was as follows:

Grade.	Quantity.	Value.	Price per ton.
50° B.....	1,518,271	\$10,681,246	\$ 7.04
60° B.....	657,076	4,976,453	7.57
66° B.....	1,019,024	14,211,381	13.95
Other strengths.....	2189,795	2,787,971	14.69
Total	3,384,166	\$32,657,051	\$ 9.65
50°, 60° and 66°, reduced to 50°.....	3,868,152	29,869,080	7.72

¹Includes acid reported not only as 50°, but also as 52°, 53°, and 55°.

²Includes stronger acid reported as oleum, etc., carrying varying percentages of free SO₃.

The production of sulphuric acid from copper and zinc smelters in 1915 in tons was as follows:

Source.	Quantity.	Value.	Price per ton.
Copper smelters, 60°.....	360,522	\$2,749,633	\$7.63
Zinc smelters, 60°.....	484,942	4,292,493	8.85
Other strengths.....	59,189	579,115	9.78
Total	904,653	\$7,621,241	\$8.42
60° acid reduced to 50°.....	1,056,830

In the Survey's preliminary statement on sulphuric acid, issued at the beginning of this year, the output of acid reduced to 50° B. and that of stronger acids differ appreciably from that given above, though the totals differ only by a fraction of 1%. This is due to a lack of differentiation in the returns received at the beginning of the year, whereby a considerable quantity of the stronger grades of acid were not reported as such but were included with 65° acid; were converted to 50°, and then reported in terms of this acid. The preliminary figures, therefore, for 50° acid are high, while those for oleum and the stronger grades are low, as compared with those tabulated, but the totals, as stated, differ only slightly.

During the last few years it has been customary to reduce different strengths of acid to 50° B. whenever sufficient data were available for conversion, but as the production of stronger acid is becoming more important, this will now be classed separately and no reduction will be made in terms of 50° acid. In the preliminary statement, issued early in January, 1916, this separation was not possible.

Too much weight must not be attached to the values given in the tables, for sulphuric acid values have varied widely during the year. Producers who had previously entered into long-time contracts sold acid at prices much below those now current, especially during the last part of 1915. The trade in strong acids was active on account of the demand from the explosives and war munitions industries, but this demand came only after the first quarter of the year and was very strong only during the last half of the year. Before that time some acid plants were shut down. The average values given are therefore much below those which ruled on the market at the close of the year.

The above figures are final so far as the Survey's present information goes, but are subject to change, if necessary, when the printed report is issued. The changes, if any are made, will probably be slight.

Germany's April Pig-Iron Output.—German pig-iron production for April was 1,073,705 metric tons, or 35,790 tons per day, which compares with 1,114,194 tons in March, or 35,942 tons per day—the war record. The April output was made up as follows: Foundry iron, 165,885 tons; Bessemer iron, 13,864 tons; Thomas or basic iron, 687,689 tons; steel-making iron and spiegeleisen, 187,704 tons, and forge or puddle iron, 18,564 tons.

Exports of copper from Atlantic ports for the week ending June 22, were 4359 tons; since June 1 there were 24,296 tons, against 14,390 for the same period last year.

Operations of the Magma Copper Co. at Superior, Arizona

By W. A. SCOTT.

Magma Copper Co., Superior, Ariz., began April 28 to sink from 1200 to 1600 ft. The depth reached June 1 was about 1350 ft. This is a 3-compartment shaft, the collar of which is 1200 ft. in on a main tunnel level. The mine is equipped with a Nordberg double-drum electric hoist, good for 2000 ft., and an electric-driven air compressor of 1500-cu. ft. capacity. Ore is being mined on the surface and on all levels. Carbonate ores, amounting to 1000 tons per month, are being taken from the surface workings, and from there down to and including the 600 level, and shipped direct to smelter. The sulphide

Bleichert aerial tramway, of 8-cu. ft. buckets, which carries the daily tonnage required in one 8-hour shift. All coarse crushing at the mill is also done in one 8-hour shift. The Blake jaw crusher is used for coarse and the Symons 24-in. disc machine for intermediate crushing. The fine grinding is accomplished by a Marcey chrome steel ball mill and a Chalmers & Williams tube mill, the former reducing to 12 mesh and the latter to minus 60. The Marcey product is concentrated over roughing tables, the tailings from the latter passing to the tube mill, thence to the Callow flotation system; the tailings from flotation cells are

MILL AND SURFACE PLANT OF THE MAGMA COPPER CO.

ores, occurring as chalcocite, bornite and chalcocopyrite, are obtained from 500 to 1200-ft. levels, but the line between carbonates and sulphides cannot be definitely drawn, as the oxidation extends deeper in some parts of the property than in others. Close to 250 tons per day of sulphide ores are being mined; of this, 210 to 225 tons are milled, the remainder being hand-sorted, high-grade ore, which is shipped. Zinc sulphide ore is found between the 600 and 1200-ft. levels, and exists in the same lode as does the copper ore; the two run in parallel shoots and are clearly segregated from each other. For instance, in one place occurs a 5-ft. shoot of 20% copper ore, and within 15 ft. is a shoot of ore running 25% zinc; but there is practically no zinc in the copper ore and no copper in the zinc ore.

The ore is transported from mine to mill over a

reconcentrated on Wilfley slime tables. By these processes 70% of the total recovery consists of table concentrates and 30% of flotation concentrates. The ore milled in 1915 averaged 6.43% copper and 7.45 ozs. silver. The concentrates produced for that year averaging 16.67% copper, 19.05 ozs. silver and \$2.18 gold. The total recovery for 1915 was 86.76% of total content. In making these products the silver goes with both—the table and flotation concentrates. Milling operations thus far have been confined to the copper sulphide ores, with their silver and gold content.

However, the company has practically completed a 50-ton plant for concentrating by tables and oil flotation its zinc ores, estimated to run 15% zinc, 4% lead, and accompanied by some silver and gold. For the zinc mill the same system of crushing and grind-

ing will be employed as is used in the copper mill. The double-deck tables of the Deister Machine Co. and a 3-cell Callow flotation machine will be used for concentration.

The operating force of the Magma Copper Co. consists of the following: W. C. Browning, general manager; E. H. Lundquist, mine superintendent; J. A. Garrett, mill superintendent; A. Robinson, master mechanic; I. A. Ettinger, mine engineer.

The company's 30-mile narrow gauge railroad runs from Magma station to Superior, its tracks extending up to the mill. A consolidation of other properties has been made at Superior, taking in the Alice-May, Lake Superior & Arizona and a part of the Magma group, under the name of the Superior & Arizona, which is controlled by the Magma Copper Co. The property is to be further developed and operated.

Strontium Industry in the United States in 1915.

The manufacturers of red fire and of beet sugar are said to have shown considerable interest in domestic strontium deposits during the last year. If sugar holds its present price the beet-sugar makers might perhaps profitably substitute the strontia method for the one they now use, but the substitution will require considerable time, and its economy must depend on several economic factors which are unknown to the U. S. Geological Survey, by which the statistics of the industry are compiled. The returns received do not show that any strontium-bearing ores of domestic origin were sold in 1915, or that any American deposits were exploited.

The deposits in northwestern Ohio and southeastern Michigan seem to be the best available for early exploitation. Celestite, a strontium mineral, is reported to occur in workable quantities in certain limestone quarries near Toledo, O., though it is not now recovered. The mineral is found in broken and open beds of dolomite, or magnesian limestone. The installation of expensive machinery for its recovery is hardly warranted, but the larger pieces of celestite could be easily hand-sorted from limestone on picking belts, or possibly on the ground, and would probably find a market.

Large deposits of celestite occur in Arizona and California, but they are far from markets and of low grade as compared with commercial ores now used. Plants for making commercial strontium compounds may eventually be built at places where both these sources could be drawn upon, but the development of these deposits must wait on the decision of the sugar refiners to adopt the strontia process.

Most of the commercial ores used in making strontium salts are of high grade, containing at least 95% strontium sulphate. English celestite is at present largely used on the eastern seaboard and is laid down at the works at about \$12 a ton, so the owners

of deposits of strontium ores must not hope for large profits on their crude material.

The principal commercial strontium salts are strontium hydroxide, used in the beet-sugar industry, and strontium nitrate, used in pyrotechnics, in which, however, strontium chloride is also used. Small quantities of certain organic and inorganic salts, such as acetate, lactate, bromide, iodide, arsenite and phosphate, are used in medicine.

Strontium nitrate was formerly used in making some types of smokeless powder, but the powder companies, it is said, now use the salts of strontium only for making illuminating or signal shells, in which the value of the strontium lies in the brilliant red color it imparts to the flame produced by explosion.

The imports of strontium oxide, protoxide of strontium, and of strontianite, or mineral carbonate of strontia, in 1914, as reported by the Department of Commerce, were valued at \$1016, and in 1915 at \$6411. The imports of celestite (strontium sulphate) used by domestic manufacturers of strontium salts are not recorded, as this mineral is classified with other chemicals not specially provided for. Strontium salts are imported free of duty.

Roasting or Sintering Apparatus Using Electric Heating.

A continuous apparatus for roasting or sintering ores working on the down-draft principle and with "electric firing" is patented by William H. Hampton, of New York City. (U. S. patent 1,171,117; assigned to the Conley Electric Furnace Co., Inc., of Wilmington, Del.) The ore or ore mixture is fed from bins into an endless chain conveyor composed of box or trough-like sections hinged together and perforated at the bottom. The ore is then transported along a straight or curved path to a point of discharge. During their course the sections pass over a suction arrangement, which consists of a compartment beneath the conveyor, connected to a suction pump. The top of the compartment is perforated. Above this compartment and above the conveyor is a heating compartment containing electrical resistances. Air passes into this heating compartment, is heated and then passes down through the ore by the suction which causes the down-draft. The heating resistances are made of 60% clay and 40% carbon. If the ore contains sufficient combustible material to need only initial ignition, thereafter burning itself, it can easily be treated by this method. The air necessary to continue the combustion can be supplied from an adjacent compartment either as cold or hot air. If the operation is not to be a sintering one, agitation may be used. It is claimed that ores with less sulphur content than ordinarily used can be roasted and sintered, and that in cases where fuel is needed, less will be used with this process.

Mining and Metallurgical Progress in the S. W.

By SEELEY W. MUDD, E. M.*

The past year which has seen so much of sorrow and tragedy in Europe has been full of romance in the mining and metallurgical operations of this country. The prices of nearly all metals and non-metallic minerals have risen to very high figures; production has been raised to a maximum and still consumers are asking for greater and greater quantities of materials and seem to be able to pay any prices which may be necessary to adequately supply their needs. In addition to great quantities of the more common metals, the western part of our country has been called upon for increasing amounts of the rare metals and of non-metallic minerals.

The changes in many industries have been kaleidoscopic and yet the word kaleidoscopic hardly conveys the proper impression, for these changes have had rational causes and are the logical although unforeseen sequences of the titanic struggle in Europe. The past year and a half has revolutionized our conception of war and its methods and its varied and enormous necessities. We are told that in order to maintain a million soldiers at the front there must be three million workers in the fields, mines and factories. Prior to 1915 probably very few students even of scientific warfare had any adequate conception of the enormous quantities of steel, copper, zinc, lead and explosives that are consumed on a modern battlefield. At the beginning of the war the mining companies greatly underestimated these requirements, but now they have come to understand that the war demand is the dominating factor.

At the beginning of 1915 the mining and metallurgical plants of this country were little if any more than half employed. During the first quarter of that year there was a quickening into more normal life and at present nearly all of these industries are operating above their normal capacity.

Increase in Metal Production.

The steel mills in 1914 made about 22,000,000 tons. They are producing now at the rate of 38,000,000 tons per year and facilities to further increase capacity are under consideration. The unfilled tonnage of the United States Steel Company, almost ten million tons, is greater than at any previous time and the present enormous output is assured for the balance of this year in spite of the fact that the price of Bessemer pig has advanced from \$14.89 in 1914 to \$19.95 in December, 1915.

The copper production for 1915 of the regular refining plants of the United States, notwithstanding the reduced output of the first quarter of that year, was greater than that of any previous year—having been

1,647,000,000 lbs. If the present output of the refineries of this country is maintained throughout this year a production of over 2,000,000,000 lbs. will be attained. This would be an increase of about 25% over the year 1915. The average price of the metal for 1914 was between 13 and 14 cts. per pound, and for 1915 about 17¼ cts. Based on the enormous sales already made for deliveries in 1916, it is estimated that the average price for this year will be 24 to 27 cts. per pound. These remarkable figures suggest a total value of the copper output of our refineries for the year 1916 of \$500,000,000 to \$550,000,000, as compared with \$288,000,000 in 1915.

The zinc situation has been even more radically changed. Normally our country exports little or no zinc—the production of 300,000 to 350,000 tons per year being approximately equal to our own consumption. The output increased very rapidly in 1915 and the U. S. Geological Survey estimated the production as 489,519 tons, an increase of 39% over the production of 1914. With the additional retorts in operation, which are under construction or contemplated, and allowing a production of 35,000 tons for the new electrolytic zinc plant in Butte, we will be producing at the rate of 700,000 tons by the end of this year. This transformation has been brought about by the enormous demand, both foreign and domestic, which has led to an increase in price from about 5½ to an average of 13¼ cts. for the year and a present quotation of about 17 cts. per pound. The same general story with varying details could be told with regard to lead, antimony, tungsten and many other commodities.

Developing Latent Resources.

Our resources have been sufficient to respond to the phenomenal demands remarkably well in many instances and we feel like congratulating ourselves, but we should also be thankful that these demands have made clear some of our national weaknesses and shortcomings. It is extremely important that our nation shall be conscious of its needs so that we may better know how to prepare for national defense.

Unfortunately many of our great chemical and manufacturing industries have depended and still depend upon foreign sources for their supplies of certain materials such as potash, nitrates, chrome, manganese, antimony and magnesite. One of the helpful effects of the war has been to stimulate production of these minerals in the United States.

During the year several strong financial interests have undertaken to secure potash from the kelp of the Pacific Coast and have spent and are spending large sums in trying to solve this problem. Those in control of the Searles Lake deposits have continued

*Address delivered at the annual banquet of the Chamber of Mines and Oil, Los Angeles, Calif.

their earnest work and are now erecting plants there and at San Pedro. If they are as successful as they hope, our country will be entirely free from dependence on Germany for its potash. Such efforts should receive our hearty co-operation and aid so that these industries may become firmly established. The producers of potash in this country must look forward to keen competition in the future for it is well known that the price of German potash prior to the war was arbitrarily fixed by the government and in case of necessity this price can be very greatly reduced and still leave an excellent profit to the German producers.

Normally the magnesite users import about 90% of their material—only 10% being mined in the United States. During the past year the shipments of magnesite from California have increased materially. Whether this California industry will be able to survive the competition of Austrian producers under normal conditions is uncertain, but the California deposits are being developed and our potential resources will probably prove to be sufficient to supply the demands of our country in case of some future emergency.

The production of quicksilver in California has decreased during the past ten years from 30,000 flasks to 13,000 flasks, while the production of Austria increased from 17,000 to 27,000 flasks and in Italy from 11,000 to 30,000 flasks. The import duty decreased from 10 to 7 cts. in 1895 and to 4.8 cts. in 1913. The imports increased from 84 lbs. in 1906 to 614,869 in 1914. During the past year there was only a slight increase of production, notwithstanding the price was doubled.

For many years the large deposits and cheap labor of China and Mexico have made it possible for these countries to control the antimony market of the world. The high price of the metal has induced the operation of a number of mines in the United States and has caused the erection and operation of several small smelting plants, the most important smeltery being located at San Pedro, California. Much of the ore smelted by the latter plant is derived from mines in Kern and Inyo counties.

Atolia, California, has been one of the important producers of tungsten for a number of years, but probably few of us realize what a hive of industry it is today or that its shipments amount to about one-half million dollars per month. The price of 65% tungsten ore is approximately \$5000 per ton—about ten times its normal value.

Southern California has three borax properties which furnish borax for our entire country—aggregating in value perhaps from \$1,500,000 to \$2,000,000.

It is not generally known that Arizona is now producing a small quantity of high grade asbestos, a mineral which is imported in large amounts from Canada. The only other producing mines in the United States are located in Georgia.

The southwest also produces gypsum, diatomaceous earth, soda and soda ash, salt, mineral water, stone and rock products, talc and other minerals

worth between two and three million dollars, in addition to Portland cement valued at three or four million dollars.

In the southwestern portion of the United States the past year has brought new life to our mining sections and especially increased activities at the camps of Oatman and Jerome in Arizona and of Atolia in California and in the zinc producing camps of Cood-springs, Nevada, and Chloride, Arizona.

The Oatman gold district, through important developments, has become very widely known and it is hoped that additional favorable discoveries may be such as to add greatly to the value of its mines.

At Jerome, Ariz., another very great copper mine has been developed, and the effect has been to stimulate speculation and increase prospecting which may result in other important discoveries in Arizona, which state produced in 1915 23% of the world's copper or 38% of that mined in the United States.

Outlook for the Future.

The condition of many industries is now eminently satisfactory, but what of the future? By the end of the war the capacity of our steel mills will be greatly in excess of the probable consumption of our country. In order to maintain reasonable prosperity in these industries, we must be able to produce cheaply and to market much material abroad. It is thought that there will be an excellent demand for copper during the period of reconstruction in Europe and as this must be derived largely from the United States, the copper producers are expecting a protracted period of large production and fair prices.

In the zinc industry for some months earnest, far-sighted efforts have been under way to retain in this country much of the zinc smelting which before the war was done in Belgium and Germany. This must be accomplished within a year or so, otherwise from 30 to 50% of the retorts of the United States will be cold.

Similar conditions prevail with regard to other metals and the wise administrators are not giving their thought to self-congratulation, but to careful plans for the economic struggle of the future.

Referring again to the southwestern portion of the United States, it may be assumed that this section surely will continue to yield its share of the more common metals. It is to be hoped that in addition the production of potash, magnesite, tungsten, chrome, manganese ores and other commodities may gradually increase and become permanent and well established industries. It will not be easy or simple to bring this about. Perhaps sympathetic treatment by the government, cheaper transportation and careful administration may accomplish it. If we in the southwest do succeed in making our country independent of outside sources for more of the vital requirements of our nation may we not assume that we have been of material aid to our country and may we not from day to day feel a patriotic inspiration in our work and not look altogether to the balance sheet?

The Iron Ore Deposits of Cuba and Method of Mining

The principal iron-ore deposits of Cuba are divided into two classes. The hard hematite and magnetite of the south coast mountains, and the soft brown hematite and limonite of the north coast of Camaguey and Oriente provinces. The south coast ore was originally exploited in 1884 by the Juragua Iron Co. Its mines are situated in the hills, 10 to 15 miles east of Santiago de Cuba. About 5 miles farther east are the properties of the Spanish-American

systematically kept up well in advance of mining. Open-cut methods are employed. In the larger mines, steam shovels are operated for removing the overburden. The disposal of waste is simple, as the almost invariable location of the mines is along steep hillsides. Blasting is done at fixed hours, and great care is taken to avoid accidents of all kinds. Drilling in the larger mines is done by tripod drills, using steam or compressed air. The ore is loaded by hand

OPEN-CUT WORKINGS ON A CUBAN IRON PROPERTY.

Iron Co., the largest of the mining concerns. Eight miles west of Santiago, the Ponupo Mining Co. at El Cuero has successfully operated since 1909.

The occurrence of the south coast ore is in irregular deposits usually small and broken up and mixed with siliceous rock. It is mainly a fine-grained magnetic intermixed with specular hematite. Diorite is the most common country rock. The ore is largely a low phosphorus as well as a low sulphur grade. In consequence of the interrupted structure of the ore bodies much waste rock must be handled. Careful preliminary exploration work is always undertaken to insure successful mining operations, and the work is

into the mine cars on account of the necessity for sorting.

Tungsten ores occur with a great many other ores, in Cuban deposits. The presence or absence of tourmaline divides the deposits into two main groups; those free from tourmaline are the more common. More important perhaps is the presence of sulphides. These are never absent, but their relative amounts are not sufficiently well known to make a satisfactory classification; they are mainly sulphides of iron and copper, together with the products arising from their alteration. The most important accompanying ores are molybdenite (San Virgilio, Los

Coloraditos), and bismuthite or carbonate of bismuth (El Aguila, El Salado). Scheelite is generally found in small quantities. There is but one region—Mazan—where cassiterite occurs with wolframite. The cassiterite beds of Salvador do not contain wolframite; their formation belongs to an earlier stage (fissures and impregnations; no quartz-and-mica veins).

The main deposit occurs in the Los Condores mine, in the province of San Luis. The other mines are not of importance; some of them are abandoned, and others have not yet been worked. In Los Condores, the vein yields between 1 and 4% of wolframite. The proportion diminishes as the depth increases (1.28%). The average proportional yield of the other mines is not known.

Mining and Preparation of Feldspar.

In mining feldspar the personal judgment of the operator and his employes regulates the quality of crude material accepted and on the uniformity of this selection the manufacturer depends for the maintenance of the quality of his ware. Fortunately in most of the feldspar quarries the men employed have been trained by long acquaintance with the feldspars of the district, otherwise serious error in selection might easily result. The ordinary process of sorting the feldspar is as follows (Bur. of Mines Bull. 92):

The quarried rock is piled in long rows and then a crew of men provided with light sledges sort the pieces, breaking off the impure parts. By this system, known as "cobbing," the rock is prepared for the mill.

The accepted material is then heaped in an open space, where it is exposed to the weather for a few weeks in order that the rains may carry away any dirt which may be adhering to the broken stone. The length of time allowed for the elements to effect the cleaning of the rock is dependent largely on the urgency of the demand for the crude material. All crude feldspar was formerly subjected to thorough washing but this practice has been abandoned in recent years. Another cause of serious contamination is surface water containing salts which runs down the faces of the quarry and stains the rock. These stains or incrustation on drying adhere so firmly that any ordinary method of cleaning or washing fails to remove them.

The handling of the feldspar from the time it reaches the mill to the time it is delivered on board cars for shipment to the consumer consists of but two steps—crushing and pulverizing. The methods employed to accomplish these two results have changed from time to time, but the result has not changed materially.

When the crude feldspar reaches the mill it is often wet from snow or ice in winter or from quarry moisture in the spring. The general practice is to dry the crude feldspar in a vertical kiln or on a hot plate. Neglect of this point causes the fine particles

to pack and later to cause trouble in the pulverizing process, but the most valuable result obtained is the elimination of fine dirt which sticks to the lumps of feldspar when wet but can to a considerable degree be shaken loose when dried and the feldspar handled with a steel fork.

The dry feldspar is ready for crushing. The processes differ in different grinding plants, but they may be divided into two classes: (a) Those in which the crude feldspar, after being reduced by sledge to 3 or 4 ins. diameter, is fed directly under the rolls of a buhrstone chaser, and (b) those in which the crude feldspar is fed into a rock crusher which reduces the feldspar to a maximum of 1 in. in diameter and then goes to the buhrstone chaser mill, which completes the crushing process.

Rock crushers are of two kinds—jaw crushers, which are intermittent machines, and gyratory crushers, which are continuous machines.

The operator who employs a crusher of either the jaw or gyratory type has to deal with the problem of cleaning his crushed material of iron and steel particles. The simplest and surest method of accomplishing this result is to screen out all the fine material, because the metal is invariably ground off the plates in very small particles. The objection to this method is the large amount of fine material wasted, which in some cases is as much as 10% of the rock crushed.

Apparatus to eliminate iron and steel particles from dry powdered rock have been only fairly successful and have not come into general use. The most successful method is to use a system of magnets and to have the fine material in the form of a slime or slop. The expense of installing such an apparatus and of drying the cleaned slime will add somewhat to the average cost of crushing the feldspar but will show a big saving as against the rejection of all the dust material from the crusher.

Where the jaw or gyratory crusher has not been introduced the primitive chaser mill is used for crushing the crude feldspar.

The chief users of feldspar are the manufacturers of white pottery ware. The manufacturers of glass and enameled metal wares are also extensive users of feldspars. The scouring-soap industry uses a limited amount. An enormous amount is annually consumed in the manufacture of roofing and for poultry grit, these, however, requiring a low-grade feldspar. Pulverized feldspars of the potash varieties are also used as ingredients in some fertilizers and for this use the presence of iron-bearing impurities is not detrimental.

Official Government reports show ferromanganese imports in May to have been 8466 gross tons. This is the largest month this year and compares with an average of 6474 tons per month to May 1, 1916. The May imports were received as follows: 6195 tons through Baltimore, 1198 tons through Philadelphia and 1073 tons through New Orleans.

A New Low-Pressure Turbo Blower.

The Ingersoll-Rand Co. has added to its turbo compressors and blowers a low-pressure machine to handle volumes from 3000 to 35,000 cu. ft. per minute at from 1 to 2½ lbs.

These are particularly adapted to such service as foundry cupola blowing, atomizing oil for oil burners, supplying blast to heating and annealing furnaces of various kinds, blowing air for water gas generators, pneumatic conveying and ventilating. They are of the single-stage, double-flow type and are furnished either electric motor, steam turbine or water wheel driven.

Electric drive is generally employed for these classes of service, and in the case of the I-R turbo blower, the high-operative speed permits direct coupling to motor, a first cost economy.

The motor-driven blower maintains constant pressure, while delivering any volume from zero to maximum demand, and proportionately varying the electrical horse power input.

These blowers embody the 4-bearing construction featured in all turbo machines of this make. The casing is horizontally split for ease in installation and subsequent inspection. The assembled casing is doweled and bolted to a heavy sub-base which ordinarily serves for both blower and driving element. The blower occupies small floor space and its vibrationless operation obviates the necessity for foundation bolting.

The impeller is of the enclosed double-flow type, claimed by the manufacturer to secure the highest efficiency. The wheel is machined from a solid, special steel forging. Vanes and covers are of pressed

steel accurately riveted. All rivet heads are driven flush and the entire assembly polished. Every care is taken to reduce skin friction.

All impellers are overspeeded in a testing machine to insure correct balance, strength and eliminate vibration. Impellers are keyed to a heat-treated, forged-steel shaft. Labyrinth packing is employed to prevent

CENTRIFUGAL TESTING MACHINE.

leakage between impeller and casing. Bearings are ring oiled and both bearings and their housings are horizontally split.

The use of flexible couplings between blower and driving unit is standard practice. Machines are all of the closed intake type. The intake opening is at the bottom and discharge at the top. The flow of air from this type of blower is absolutely uniform, avoiding all

INGERSOLL-RAND LOW PRESSURE TURBO BLOWER SHOWING UPPER CASING REMOVED.

pulsations, which makes it especially desirable for foundry work.

There are no rubbing surfaces precluding the necessity for adjustment to take up wear and minimizes the cost of maintenance. The only lubrication necessary is that of the bearings, all other parts working without friction.

Big Capital Buys East Side Properties at Tonopah, Nev.

After the discovery of the trachyte formation in the Buckeye No. 3 shaft, and the striking of several rich stringers in that property that showed high values in gold, the Buckeye Co. suspended work upon that shaft and closed in a gap by buying the Belmont Extension and Buckeye Eagle ground. This gives the Buckeye-Belmont Co. a total length of nearly a mile and a half on the mineral belt of Tonopah, which adjoins the Tonopah-Belmont on the northwest, the Rescue Eula on the west, and the Halifax on the north, all of them being steady producers.

Recent developments in the Halifax and Buckeye show higher percentage of gold than ever before found in the district. The Halifax shows some good grades of shipping ore running better than 40% of its value in gold, whereas the Buckeye uncovered the top of a low-grade vein that shows \$4 in gold to an ounce of silver.

On top of this important information that the gold values are increasing eastward, comes some important deals in undeveloped properties still further east. The East Union Mining Co., that has held eight or ten claims in idleness for several years, eastward from the Halifax and Buckeye, has sold the control of its stock for \$25,000 and the K. C. group, organized with 1,500,000 shares, sold the control of the issued stock for \$18,300. Interests connected with the Tonopah-Belmont Mining Co. are the purchasers. On top of this, a meeting was called for June 30, of the East End Development Co., still further east. This property is fully equipped and the shaft is down 450 ft., and has been for some time controlled by Belmont interests. Work was suspended there a few weeks ago. Following the suspension of the work, the intermediate properties were bought up. Other properties are under examination, and it is said that \$25,000 is offered for the East Belmont property. With these big interests taking up the development of the eastern properties, increased activities will make a boom in the stocks of all Tonopah east side properties.

When it is remembered that the copper stocks took a great slump at the time copper went down to 10 cts., and the copper mines reduced their operations, it will also be remembered that the stock market for copper shares did not advance materially until copper rose to 20 cts., and from there on up to near the 30-mark copper securities have been exceedingly active and high priced. Shares that sold as low as a few

cents on the dollar, now command many dollars a share.

The same thing is occurring in silver shares. Silver metal has advanced about 50%, yet the silver shares have not responded materially, even with double dividends indicated. But when one thinks of the Comstock mines, and shares commanding over \$4000 a share (\$100 par) at the time that silver was above \$1 an ounce, it is reasonable to expect that when silver reaches the \$1 mark again, that silver stocks will soar as have the coppers.

Mine Production of Lead and Zinc in Wisconsin in 1915.

The value of the mine output of lead and zinc in Wisconsin in 1915 was \$10,486,212. The value of the lead and zinc, together with a very small yield of silver and copper, in 1914, was \$3,291,437.

The quantity of raw zinc concentrates from the mines increased 22%, and as the demand for low-grade concentrates was small, the increased production resulted in the building of several roasting and separating plants. Many leases were prospected by drilling and the erection of new and the rebuilding and enlargement of old concentrating plants will tend to insure an increased output in 1916.

The lead concentrates sold increased in quantity from 2028 tons, valued at \$85,196, in 1914, to 3175 tons, valued at \$171,091, in 1915. The sphalerite concentrates sold increased in quantity from 103,535 tons to 138,996 tons. The value of the sphalerite concentrates was \$5,333,316 in 1915, compared with \$1,924,126 in 1914. The quantity of the zinc carbonate concentrates sold declined from 2758 to 2579 tons.

The metal content of the galena concentrates was 828 tons more than in 1914. The recoverable zinc content of the sphalerite and zinc carbonate concentrates increased 10,290 tons over that of 1914 and the value was \$3,409,190 more.

The average tenor of the sphalerite ore marketed by the mines was nearly 1.5% higher in 1915 than in 1914, and the average price paid for the concentrates was \$20.64 a ton more.

The Benton district was again much the largest producer of both lead and zinc concentrates, followed by Hazel Green and Livingston.

The production of lead and zinc by districts and the tenor of the ore and concentrates in Wisconsin in 1915 are shown in the following tables prepared by J. P. Dunlop, of the U. S. Geological Survey:

	1914.	1915.
Total crude ore, short tons.....	1,387,490	1,934,000
Total concentrates in crude ore:		
Lead, per cent.....	0.14	0.16
Zinc, per cent.....	8.02	7.32
Metal content in crude ore:		
Lead, per cent.....	.11	.12
Zinc, per cent.....	2.8	2.65
Average lead content of galena concentrates, per cent.....	73.7	73.5
Average zinc content of sphalerite concentrates, per cent.....	35.05	36.5
Average zinc content of zinc carbonate concentrates, per cent.....	27.5	24.9
Average value per ton:		
Galena concentrates.....	\$42.01	\$53.88
Sphalerite concentrates.....	\$17.73	\$38.37
Zinc carbonate concentrates.....	\$13.65	\$18.70

Accidents from Misfires and How to Prevent Them.

By EDWIN HIGGINS.*

Of the 10 fatal accidents reported in California mines during the first 4 months of 1916, three of them resulted from missed holes. In addition to these fatalities, several men were seriously injured. Such a large percentage of accidents from misfires is very unusual.

There are many things to be considered in the prevention of accidents of this nature. In the first place, it is necessary that powder, caps and fuse be of good quality. The storage and care of explosives have much to do with their action when put in use. They should not be stored in damp places, nor exposed to dampness after removal from the magazine. Fuse should be observed closely to see that it is not damaged. It should be freshly cut when put into the cap. Capping fuse more than 36 hours before using it is poor practice. All explosives should be used as soon as possible after removal from the magazine.

If the face to be blasted is very wet, it is important that holes be not loaded too great a length of time before blasting. In wet places care should be taken to protect the joint between the cap and fuse. The use of oil or grease for this purpose is very objectionable, for the burning fuse, coming in contact with such material, causes it to form a spray which may easily cause a misfire. Fuse manufacturers supply a satisfactory compound for water-proofing. Also, there is on the market a rubber covering for protecting the cap from moisture. Good roofing paint gives satisfactory results. Ordinary white laundry soap will water-proof a joint for a short period of time.

The making of the primer is a very important consideration. The Bureau of Mines has made many and extended tests to determine the best method of making primers. Without going into detail, it may be said these results showed that any method of making the primer necessitating the bending of the fuse at a sharp angle is very undesirable. The double lace, or placing the cap in the bottom of the cartridge and bending the fuse back through 180°, are objectionable. The two methods that resulted in by far the minimum of misfires under all conditions are shown in the accompanying sketch.

After everything possible has been done to insure the proper detonation of the charge, the next matter of importance is to see that misfired holes are handled safely. This appears to be simple enough, but any method that may be devised brings into consideration the human element. There will always be men who, from time to time, will violate rules. Frequently an experienced man will take even greater chances than will a greenhorn. Men who have spent almost a lifetime handling powder have been killed as a result of misfires. In many cases familiarity with powder causes a man to regard danger lightly.

It is second nature to most miners to count the number of reports from a round of holes. It is at this point, however, that many misfire accidents originate. The miner either goes back to a missed hole too soon or he fails to report the misfire. If he does report it, there often develops some mistake in transmitting the information to the proper man on the next shift.

The following plan has been found satisfactory in handling misfires: See that miners count the number of blasts and, if the entire round has not exploded, provided means so that a report can be made to the shift boss of the next oncoming shift as to the number and location of the missed holes. A record may be kept on a bulletin board either underground, or in the change house. Some companies provide printed forms and cause their miners to report misfires to the shift boss, who in turn delivers the printed report to the shift boss of the next oncoming shift.

Misfired holes should be handled under the supervision of the shift boss, or some one experienced in this class of work. To insure safety in recovering a missed hole, the following procedure should be observed: Under no circumstances should any one be

TWO METHODS OF MAKING A PRIMER THAT GAVE THE LEAST NUMBER OF MISFIRES IN BUREAU OF MINES TEST.

allowed to return to the face within 45 minutes of a misfire. An attempt should first be made to fire the missed hole by means of a new primer. If this is not possible, or if it fails, a new hole should be drilled at least 2 ft. from the missed hole in such a direction that it will not encounter the defective charge in the old hole.

The only method of insuring compliance with requirements laid down for the proper handling of missed holes is to use the strictest discipline in every case of disobedience to rules. No matter how valuable a miner may be, he is a menace to himself and those working with him, if he will not use care in the handling of missed holes.

The above short discussion relates chiefly to the prevention and safe handling of misfires. For information on the general subject of storing and handling explosives, the following publications, which may be obtained free of cost on request to the Director of the Bureau of Mines, Washington, D. C., are of interest:

Technical Paper 18. Magazines and Thaw Houses for Explosives, by C. Hall and S. P. Howell.

Bulletin 80. A Primer on Explosives for Metal Miners and Quarrymen, by C. E. Munroe and C. Hall.

Miners' Circular 19. The Prevention of Accidents from Explosives in Metal Mining by Edwin Higgins.

*Chief Mine Inspector, California.

What the Mining Companies are Doing

Butte & Superior

The Butte & Superior Co.'s report for May on its oil flotation plant shows an increased ore tonnage treated, but less concentrates recovered than in April, and a decrease of \$18.24 per ton in value. Comparison follows:

	Tons ore.	Costs per ton.	Zinc con- cen. tons.	Value per ton.
May	50,688	\$3.22	11,658	\$ 65.25
April	50,112	2.84	12,080	83.79
March	52,089	2.69	12,190	83.62
February	49,800	2.52	10,775	93.56
January	49,428	3.05	10,535	101.60
December	45,277	2.93	10,409	86.00
November	47,872	2.91	10,386	90.58
October	43,092	2.75	10,473	79.59
September	37,278	3.19	8,968	81.77
August	40,809	3.38	9,561	80.23
July	41,547	2.95	9,482	75.76

American Zinc, Lead & Smelting Co.

The American Zinc, Lead & Smelting Co. has issued a report to New York Stock Exchange covering its operations for the 4 months ended April 29, 1916, as follows:

Earnings from mines at Cartersville, Mo.	\$ 226,844
Earnings from mines at Mascot, Tenn.	830,046
Earnings from mines at Platteville, Wis. (dividends received)	12,995
Total mine earnings	1,069,885
Ballast earnings	14,459
Earnings from smelters at Caney and Dearing, Kan.	1,119,915
Earnings from smelters at Hillsboro, Ill.	566,456
Total smelter earnings	1,686,371
Miscellaneous earnings	80,555
Electro-static separating department (deficit)	3,037
Total net earnings	2,848,233
Administrative and general exp. and inc. tax.	75,651
Balance	2,772,582
Interest received on bank deposits, etc.	7,025
Net profits before depreciation	2,779,607
Transferred to reserve	1,502,000
Four months' surplus	1,277,607

Balance sheet of the American Zinc, Lead & Smelting Co. and subsidiary companies as of April 29, 1916, as reported to the New York Stock Exchange, follows:

Assets—	
Property account	\$ 6,162,467
Investments	582,218
Insurance fund investments	32,884
Mascot ore stocks at smelters (sales price)	363,666
Mascot ore stocks on hand and in transit to smelters (at mining cost and freight)	191,953
Mascot spelter stocks (sales price)	918,266
Spelter ore stocks (at cost)	694,002
Tennessee broken ore underground (cost)	14,109
Spelter stocks (sales price)	251,976
Sulphuric acid stocks (sales price)	8,761
Inventories (at cost)	578,627
Cash	1,949,151
Accounts receivable, manufactured products	1,613,823
Accounts receivable, miscellaneous	218,842
Deferred charges to operations	124,090
Total	\$13,695,031
Liabilities—	
Capital stock	\$ 4,828,000
Depreciation and reserve funds	4,012,360
Insurance reserve fund	32,884
Accounts payable	567,869
Taxes accrued	88,196
Drafts in transit	61,241
Surplus at Dec. 31, 1915	2,796,871
Profit and loss surplus for four months ended April 29, 1916	1,277,607
Total	\$13,695,031

Consolidated Arizona Smelting Co.

The condensed balance sheet of the company as of Dec. 31, 1915, shows as follows:

Assets—	
Unissued stock	\$ 912,500.00
Unissued mortgage bonds	315,000.00
Mortgage bonds (pledged against \$225,000 notes)	337,500.00
Treasury stock and bonds	147,206.11
Property	9,180,540.26
Inventories	150,025.01
Current assets	139,068.57
Deferred assets	5,573.07
Arizona Exploration Co.	109,713.05
De Soto Power Line suspense	3,611.07
General profit and loss	186,632.39
Total	\$11,487,369.53

Liabilities—	
Capital stock	\$ 9,200,000.00
Convertible income bonds	912,500.00
Mortgage bonds	1,000,000.00
Notes payable	225,000.00
Current liabilities	104,409.93
Deferred liabilities	4,312.31
Suspense	74.55
Depreciation reserve	1,072.74
Maintenance and renewals	40,000.00
Total	\$11,487,369.53

Daly-Judge Co., Utah.

The financial statement of the Daly-Judge Mining Co. for 1915, shows as follows:

Receipts—	
Balance Jan. 1, 1915	\$ 440,153.06
Ore sales	1,041,413.74
Interest earned	38,054.12
Total	\$1,519,610.92
Expenditures—	
Mine account—	
Labor	\$135,201.92
Repairs and maintenance	21,355.87
Supplies	26,945.21
Explosives	16,049.47
Timber and lumber	37,878.96
Fuel and electric power	4,614.76
Rails, piping and cars	7,083.30
Sundries	1,603.77
Mill account—	250,733.26
Labor	\$25,186.02
Repairs and maintenance	14,223.27
Supplies	13,188.58
Assay office	1,866.61
Fuel and electric power	7,298.30
Sundries	2,144.32
Prospecting, exploration and dead work—	63,907.10
Labor	\$98,663.65
Sundry supplies	38,485.77
Fuel and electric power	8,908.76
Leasers' royalties	15,787.44
Ore expense—	161,845.62
Sampling and assaying	\$10,964.35
Hauling	13,801.12
Surveying and engineering	24,765.47
General expense, office, taxes, etc.	3,370.01
Drainage	23,177.75
Impounding	12,000.00
Dividends	915.15
Total expenditures	\$ 840,714.36
Balance Dec. 31, 1915	678,906.56
Total	\$1,519,620.92

Brunswick Con. Co., Calif.

The following report of operations of the Brunswick Con Co: is shown in the company's report for the year 1915.

Receipts—	
Balances outstanding	\$ 83,034.03
Bullion and sulphurets	223,556.80
Contingent expense	170.84
Interest	2,267.56
Insurance	27.60
Mill repair supplies	162.35
Mine supplies	674.56
New shaft development supplies	95.50
Total	\$309,989.24
Disbursements—	
Dividends	\$ 71,151.66
Mine labor	37,409.51
Mine supplies, power and equipment, etc.	34,569.96
Mill labor, supplies, etc.	32,377.53
Other labor and supplies	48,301.34
Miscellaneous disbursements	86,179.24
Total	\$309,989.24

For 1915, the working costs amounted to \$6.78 per ton, to which should be added \$1.81 for improvements, making a total of \$8.59, as compared with \$10.45 in 1914. The new mill was in commission only a little over 2 months, and it crushed less than 17% of the total ore milled. Henceforth, it will crush more than the old mill, and, with the increased tonnage thus obtained, the working costs will undoubtedly be reduced to less than \$6 per ton, exclusive of shaft sinking and improvements.

The total production in bullion and concentrates shipped, from 22,004 tons of ore treated, was \$223,556.80, to which should be added \$3,263.34, derived from sales of supplies

and interest on bank balances and invested funds, so the total gross income was \$226,820.14. Expenditures for all purposes, including \$39,751.49 for the new mill, steel head-frame and other improvements, amounted to \$189,070.61, and the profit for the year was \$37,749.53, or \$1.72 per ton. The operating profit was \$72,656.29, or \$3.30 per ton.

Mohawk Mining Co.

The Mohawk Mining Co. produced 20,705,600 lbs. of mineral in 1915, which yielded 76.75%, or 15,882,914 lbs. of refined copper. The following is a summary of the year's business:

Receipts—	
15,882,914 lbs. of copper @ 17 cts.....	\$2,700,843.19
Expenditures—	
Working expenses at mine.....	\$491,872.35
Smelting, freight and offices' expense.....	151,021.67
	<u>1,145,894.02</u>
Showing a mining profit of.....	\$1,554,949.17
Expended for construction.....	43,373.44
Net profit	\$1,511,575.73
Dividend	600,000.00
Surplus, Dec. 31, 1914.....	\$ 911,575.73
Surplus Dec. 31, 1915.....	852,208.98
	<u>\$1,763,784.71</u>
Assets—	
Cash in bank.....	\$ 58,457.44
Cash in Trust Co.....	1,050,000.00
Copper on hand sold.....	620,764.26
Cash and supplies at mine.....	115,849.23
Stock in Michigan Smelting Co.....	80,000.00
Total	\$1,925,070.93
Liabilities—	
Indebtedness at mine.....	\$112,506.10
Accounts payable	18,780.12
	<u>\$ 161,286.22</u>
Balance assets	\$1,763,784.71

Montana Power Co.

The consolidated surplus account of the Montana Power Co., for the 4 months ended April 30, 1916, as reported to the New York Stock Exchange, follows:

Surplus at date of merger, balance Dec. 31 1915.....	\$ 38,132
Undivided profits, balance Dec. 31, 1915, less payments and adjustments not chargeable to operating expenses of 1916	1,030,866
Surplus income for 4 months to April 30, 1916.....	1,012,213
Total surplus	2,081,211
Preferred dividend, 13%.....	\$ 169,257
Common dividend, 3/4%.....	291,806
	<u>371,063</u>
Surplus as per balance sheet	\$ 1,710,648

The consolidated balance sheet of the Montana Power Co. as of April 30, 1916, as reported to the New York Stock Exchange, follows:

Assets:—	
Property	\$85,373,529
Material and supplies at cost.....	302,117
Accounts receivable	633,885
Cash	1,408,750
Sinking fund deposits	2,178
Deferred charges:—	
Discount on bonds (amortized monthly).....	\$ 2,501,422
Miscellaneous	77,318
	<u>2,578,739</u>
Total	\$90,299,198
Liabilities:—	
Preferred stock in hands of public.....	\$ 9,671,800
Common stock in hands of public.....	26,907,500
Common stock under voting trusts with dividends deferred	22,500,000
Funded debt	27,632,000
Bills payable (Great Falls Power Co.—due to Great Falls Townsite Co.)	150,000
Accounts payable	366,045
Accrued interest	512,612
Depreciation, accident and miscellaneous reserves.....	849,092
Surplus	1,710,148
Total	\$90,299,198

Miscellaneous Company Notes.

According to a report recently issued the Rochester Mines Co. is free from debt, has a cash surplus and expects to pay dividends before the year is out. After the payment for its new mill, the buying of leases and development ex-

pense, the total indebtedness of the company Oct. 31, 1915, was \$205,392.43. Present liabilities as of May 15, 1916, are \$30,355.70, with current and working assets of \$40,722.27.

Reports from Juneau indicate satisfactory progress in construction work of treatment plant of Alaska-Juneau Gold Mining Co. At the coarse crushing plant the concrete work has been completed, and steel is now being erected. Good progress has also been made with concrete work on the mill and power plants.

Col. E. A. Wall of Salt Lake has transferred his three-fourths interest in the Kangaroo mining lode in Bingham to the Utah Copper Co. in consideration of \$30,000. The ground will be used by the Utah Copper Co. for dumping purposes. This ground was originally the basis of a big damage suit and the transfer settles the litigation between Wall and Utah Copper which has been waged for years.

Directors of the Calumet & Hecla Mining Co. have elected officers for the ensuing year as follows: President, Rodolphe L. Agassiz; vice-president, James MacNaughton; secretary and treasurer, John F. Perkins; assistant treasurer, Charles A. Hall; assistant secretary, A. J. Garceau. The office of president has been vacant for over a year, R. L. Agassiz serving as first vice-president and James MacNaughton, second vice-president. Robert F. Herrick was elected a director, succeeding Geo. A. Flagg.

From present indications Granby closed its fiscal year ending June 30 with a production close to 63,000,000 lbs. of copper. The May output, totaling 4,727,929 lbs., was the largest ever turned out by the company. Of the total 3,383,230 lbs were contributed by the Hidden Creek smelter, while the old Grand Forks plant turned out 1,344,699 lbs. Actual production in the 11 months up to May 31 was 58,717,551 lbs. Granby's earnings based on copper delivered at the highest prices were at one time at rate of \$50 per share. The company has been buying in some of its bonds, thereby reducing the amount of fixed charges. Dividends during the 1915-16 year were maintained at \$6 per annum.

The net profits in 1915 of the Hercules Mining Co., which owns and operates the Hercules mine at Burke, Idaho, were \$1,096,019, although the property was closed down from May 29 to August 29, because of its contract with the American Smelting & Refining Co. having expired on the earlier date. The corporation is controlled by the Day brothers and their associates, who have built the smelter at Northport primarily to treat the Hercules and Tamarack & Custer ores. The report of the Hercules Co. in detail is: Tons extracted, concentrates and crude ore, 19,441.55; gross value, \$3,090,174.75; cost extraction, \$950,852.27; cost transportation and reduction, \$986,218.96; cost betterments, \$57,084.15.

Miami Copper Co. established a new production record in May when it outputted 4,600,000 lbs. of copper at a cost of 8.7 cts. a pound as compared with a cost of over 9 cts. a pound in January. Estimating June production on the basis of May the first half of the year will record a production of over 25,000,000, produced at a cost of slightly less than 9 cts. a pound. The capacity of the company's mill will be increased to permit of a monthly yield of 5,000,000 lbs. of copper. This increase, however, is not expected to become effective until early 1917. It will involve new equipment and a new power plant, work on which has already been started. There has been put into operation a 100-ton experimental mill for Miami's low-grade ore from which an extraction of about 80% has been secured.

The Snowstorm Mines Consolidated, capitalized for 2,500,000 shares at 25 cts. each, has been organized to take over the Snowstorm Mining Co., which owns and for a number of years operated the Snowstorm copper mine at Larson, Idaho, and to acquire under lease and bond the Banner & Bangle and other groups of mining claims near Troy, Mont. Of the capital stock 1,500,000 shares will be issued to Snowstorm Mining Co. stockholders in full payment for the corporation's assets, which are said to include \$150,000 in cash and the mill and mine equipment at the property, which has been worked out and was abandoned several months ago. The machinery will be removed to the Banner & Bangle camp as soon as possible, and utilized in equipping that property.

We Begin Volume 45.

With this issue of Mining and Engineering World begins a new volume—45. The volume just completed with the issue of June 24 comprised 1210 pages, 70 pages greater than that of its nearest competitor devoted to the mining industry, and 246 pages more than the next nearest. In these 1210 pages Mining and Engineering World has reviewed the best practices in mining, metallurgy and kindred industries, especial attention being paid during the 6-months' period to the mining news feature, in which descriptions of operations and occurrences at several thousand properties appeared. The index to volume 44 is in preparation and will be published at an early date. It will be sent those who have received previous indexes and to all others who may ask for it.

Remarkable Dividend Disbursements by Mines and Works.

As was predicted in these columns several months ago, dividend disbursements by American mines and works made a record in June little short of wonderful. According to reports made to Mining and Engineering World, 68 companies disbursed among fortunate shareholders in June no less than \$34,067,016. This is only \$16,392,943 less than was paid during the entire 12 months of 1908 and fully one-third of the amount paid during all of last year. It is a record of achievement never equaled by any other line of industry and speaks volumes for the magnificent earning powers of American mines and works.

Fifteen copper companies made record disbursements in June having divided among shareholders no less than \$15,557,707. This amount should be increased to \$19,737,707 by reason of the fact that the \$4,200,000 declaration of the Kennecott Copper Corporation was made from earnings from its copper properties in Alaska and not from its holdings in other companies. Utah Copper ranks first in the amount disbursed during the month—\$4,873,470; Chino is second with \$1,957,455 and Nevada Con. third with \$1,500,000.

Fifty properties classed as gold-silver-lead-zinc producers, paid during the month \$13,174,486. Of this amount 40 companies operating properties in the United States contributed \$12,087,667; Canada with nine companies disbursed \$1,029,592 and one Mexican company paid a dividend amounting to \$57,227. The great prosperity enjoyed by the zinc producers is evidenced by the fact that the three leaders in this class are Butte & Superior first with \$2,931,492, American Zinc, Lead & Smelting Co. second with \$2,414,000 and New Jersey Zinc third with \$1,750,000.

Three metallurgical companies divided among shareholders in June \$5,354,823. International Nickel, common, leading with \$3,346,768.

Three so-called security-holding corporations

made disbursements during the month totaling \$7,080,000, Kennecott being first on the list with \$4,200,000 to its credit.

The following is a list of the companies paying dividends in June, with the date of payment, amount per share and amount paid.

	June.	Per share.	Amount.
American Sm., pfd.....	1	\$1.75	\$875,000
American Sm., com.....	1	1.50	500,000
American Z., L. & Sm.....	15	12.50	2,414,000
Barnes-Kings, Mont.....	1	.07½	30,000
Big Four Expl., Utah.....	15	.05	20,000
Big Run Zinc, Mo.....	20	.03	3,000
Bunker Hill Con., Calif.....	4	.02½	5,000

But for the unsettlement of internal conditions in Mexico during the past 2 years that country would have been a much larger producer of copper. The amount of the red metal received in this country from Mexico in the nine months ended March 31 was just 50% of the tonnage brought in 2 years ago in the corresponding period, the figures being 47,000,000 lbs. up to the end of March last against 84,000,000 lbs. 2 years ago. Last year there was received but 14,000,000 lbs. in the 9 months, but that period included the general curtailment of production during which the Greene property was shut down tight for half a year.

It has been announced that by July 1 the U. S. Bureau of Mines will have an experimental station at Golden, Colo., the equipment, etc., to be housed in the engineering building of the Colorado School of Mines. A payroll of \$40,000 per annum is connected with this station. Although general metal mining investigations will be made, more particular attention will be given the rare minerals and metals. No work will be attempted with coal or other non-metallic products, the scope being confined entirely to metallic ores and metals. The investigating of oils and natural gases is done in the California station while coal is the principal consideration at the Pittsburgh station. A station for studying clays and other non-metals is being considered. At one time Texas was the favored state in this regard, but later the decision of establishing a station there was abandoned and at the present time this question is open.

A strike is in progress on the eastern part of the Mesabi range. All underground mines in Aurora and Biwabik are closed and many in Virginia, Gilbert and Eveleth are idle or working with short crews. The trouble was started by agitators of the Industrial Workers of the World who demand that the contract system of pay be abolished and flat wages be established. The strike was declared in spite of the fact that recent wage increases amounted to about 8%. If miners do not return to work soon all the underground mines in the Virginia district will be closed by the companies, throwing thousands out of employment.

Copper Production Ceases in Mexico.

The American output of copper will be effected to the extent of 10,000,000 lbs. monthly by reason of the situation in Mexico, the Greene-Cananea mines at Cananea being the last to be shut down. American employes have been taken across the border and the property is under the questionable protection of Carranzista troops. The Moctezuma mine, a Phelps-Dodge holding, with a 4,000,000-lb. monthly production, has also been closed down, these two properties having been outputting close to 10,000,000 lbs. monthly.

Mining is a business that is rich in surprises. Unexpected and difficult situations that tax the manager's ingenuity to overcome them are constantly arising. It is the ability to cope with the unexpected that tests the fitness of a man to direct mining operations. The ways in which difficult problems that have confronted the mining man have been solved are always of interest to other mining men. If you have had unusual experience of this kind write them up; Mining and Engineering World will be glad to publish them. You may be able thereby to save some brother mining man considerable trouble.

PERSONAL.

Walter Harvey Weed is engaged in geological work at Bannack, Mont.

F. T. Hepburn of New York city is at Skagway, Alaska, for the summer.

Amel Mattson has joined the engineering staff of the Winona in the Michigan copper district.

R. C. Wallace, Manitoba provincial geologist, is making an examination of the Rice Lake district.

W. G. Matteson has been appointed geologist for the Empire Gas & Fuel Co., Bartlesville, Okla.

D. Lewers, superintendent of the Florence flotation plant, Goldfield, Nev., has returned from San Francisco.

Erl L. Sproat has become mining engineer for the Moose Mountain Iron Mining Co. at Sellwood, Ontario.

C. H. MacNutt, formerly manager of the Burma Mines Co., India, has resigned and is now in San Francisco, Cal.

A. de Deken, Belgian metallurgist and chemist, has returned to his country from a 9 months' visit in the United States.

E. Shaw, metallurgical engineer with the La Leonesa Co., Nicaragua, has resigned and at present is in El Paso, Texas.

Frank Upham, vice-president of the Hecla Co., Wallace, Idaho, and with offices in Los Angeles, Cal., is now in Chicago.

F. A. Knapp, Portland, Ore., manager of the Portoma Mining Co., Wallace, Idaho, has completed a trip of inspection to the property.

P. G. Harrison, superintendent of the National Mines Co., Winnemucca, Nev., is at present in Chicago at the head offices of his company.

Otto Sussman, consulting engineer, New York, and director of the Con. Interstate-Callahan Co., Wallace, Idaho, is now in Spokane, Wash.

President F. W. McNair of the Michigan College of Mines, has returned from a trip to Boston and New York on business for the college.

W. H. Roberts, who lately resigned the superintendency of the Wolverine & Arizona of Bisbee, Ariz., is visiting his early home, Hancock, Mich.

J. A. Force, manager of the Consolidated Mines & Reduction Co., Cripple Creek, Colo., has resigned to devote his entire attention to his private interests.

George H. Garry, engineering geologist for the Tonopah-Belmont Co., Tonopah, Nev., has been inspecting property in the Sheep Creek district, British Columbia.

D. C. Jackling has completed his trip from Seattle, Wash., around Cape Horn with the yacht *Cyprus* and is now in New York, and is expected to leave shortly for Salt Lake City.

E. L. Estabrook has returned from an extensive trip in northern China, where he examined the geology of the country. He is now at Platteville, Wis., as geologist for the Wisconsin Zinc Co.

Harry E. Sparks, recently engineer at the White Pine subsidiary of the Calumet & Hecla, has gone to the Dome Mines Co., Ltd., in the Porcupine district, Ontario, as underground superintendent.

John Barry and John Neyland, this year's graduates of the Montana School of Mines at Butte, are on their way to Tegucigalpa, Honduras, where they have accepted positions with a gold mining company at that place. The mines are located 9 miles from Tegucigalpa and to reach them the

young men will be compelled to travel on horseback for a week after leaving the steamer at Porto Cortez.

Grover Lantz, mining engineer, recently graduated from Stanford University, has been engaged in experimental work at the West End mill, Tonopah, Nev., and has left to be temporarily in Los Angeles, Cal.

A. Sakaguchi and T. Saito, chief engineer and managing director of the Furuwaka Mining Co., Tokio, Japan, have recently been studying mining methods at Bingham, Utah, and are now at Butte, Mont.

C. P. Perin, New York, has left for India by way of London. His mission is relative to the enlargement of the Tata Iron & Steel Co.'s plant at Sakchi, India, and his headquarters while in India will be at Bombay.

H. C. George, formerly chief engineer of the Wisconsin Zinc Co., has been appointed superintendent for the company, which position was recently made vacant when H. S. Snow was transferred to the office of traffic manager.

R. A. Loveland, first lieutenant, and H. W. Clark, sergeant, both mining engineers in the efficiency department; Murdock MacDuff, captain on the Osceola amygdaloid, and A. O. Beck, sergeant, clerk of the electrolytic plant, all of the Calumet & Hecla; J. F. Holmes, corporal; Bernhardt Heine and Meidel Frimodig, students at the Michigan College of Mines, and C. W. Hungerford, sergeant, mining news correspondent, are with Company A, Calumet Engineers, and will shortly go to the Mexican border.

OBITUARY.

John W. Currie, a well-known Utah assayer, died at Salt Lake City May 27. He was born in Salt Lake in 1863 and was engaged in business in that city since coming of age. He was connected in his younger days with F. M. Bishop in assaying and making chemical determinations. Later he engaged, in business for himself. For several years past he has been a member of the firm of J. W. Currie & Co., F. G. Sewell being the other partner.

Harley H. Fate, president of the J. D. Fate Co. of Plymouth, Ohio, manufacturers of the Plymouth gasoline industrial locomotive and a line of clay working machinery, died in the Huron Road Hospital, Cleveland, Ohio, May 27, 1916. Mr. Fate was 42 years old. His death followed a minor operation. Deceased was born in Crestline, Ohio, Feb. 19, 1873, and when 9 years old his father moved to Plymouth, Ohio, where the elder Fate founded the Fate industry, which was the foundation of the J. D. Fate Co. of today, to the presidency of which Harley H. Fate succeeded upon the death of his father in 1902. The business of the J. D. Fate Co. is being conducted by Harry S. Fate, who succeeded his brother as head of the temporary organization; George B. Drennan, secretary-treasurer; H. Ray Sykes, director and acting general manager.

SCHOOLS AND SOCIETIES.

Northwestern University.—A geological field course in the Lake Superior region will be conducted by the Department of Geology in August. The course will be devoted largely to a study of the Pre-Cambrian rocks, with some attention to the Pleistocene history.

Rocky Mountain Coal Mining Institute.—The annual summer meeting of the institute was held in Salt Lake City June 13 to 15. An inspection of coal properties was made June 13. Papers were read as follows: "Safety First," by J. E. Petit, state coal mine inspector for Utah; "Some Notes on Explosives," by F. W. Whiteside, chief engineer for the Victor-American Fuel Co. Officers were elected as follows: A. C. Watts, Utah, president; vice-presidents: J. C. Roberts, Colorado; F. R. Weitzel, New Mexico; A. H. Cowie,

Utah, and W. D. Brennan, Wyoming; F. W. Whiteside, secretary and treasurer.

American Electrochemical Society.—The week of Sept. 25 will be a very important one in the history of chemistry and electrochemistry in America for the Second National Exposition of Chemical Industries will be held in New York all through that week. The American Electrochemical Society will be one of the important national societies which will meet in New York during the same week. Its meetings will be held on Sept. 28, 29 and 30, and the outline of the program has just been announced. It is as follows:

Wednesday, Sept. 27, evening—General reception with registration at the Chemical Exposition, Grand Central Palace.

Thursday, Sept. 28, forenoon—Reading and discussion of papers, general subject, "Made in America"; luncheon. Afternoon—Visiting the exposition. Evening—Complimentary smoker; an invitation will be extended to the members of the American Chemical Society and other visiting chemists and engineers.

Friday, Sept. 29, forenoon—Reading and discussion of papers; luncheon. Afternoon—Visiting the exposition. Evening—Subscription dinner-dance.

Saturday, Sept. 30, forenoon—Reading and discussion of papers; luncheon. Afternoon—Visiting the exposition.

Michigan College of Mines.—The 1916 reunion will be held Aug. 8 to 11 and the following program has been arranged:

Tuesday Afternoon—Addresses (two at most), by the Governor and some distinguished mining man; reception by President and Mrs. McNair.

Tuesday Evening—Nightshirt parade, followed by smoker at the gymnasium.

Wednesday Forenoon—Parade, followed by cafeteria lunch at the gymnasium.

Wednesday Afternoon—Special M. C. M. program, to include addresses by several alumni; business meeting of the Alumni Association.

Wednesday Evening—Class and group dinners.

Thursday Forenoon and Afternoon—Trips about the Copper Country.

Thursday Evening—Informal general party, with dancing.

The following committee has been appointed on speakers: William Kelly, chairman; John W. Black, F. W. McNair, Elton W. Walker, '96, and John Knox, '99.

NEW PUBLICATIONS.

Fuel Briquetting in 1915. By C. E. Leshner. Washington, D. C., U. S. Geol. Surv. Mineral Resources of U. S. II:1; pp. 6.

The manufacture of this class of fuel is still young and little change was noted in the industry during 1915 as compared with 1914.

Fluorspar in 1915, with a Note on Cryolite. By E. F. Burchard. Washington, D. C., U. S. Geol. Surv. Mineral Resources of U. S. II:6; pp. 9.

In reviewing the situation it is noted that in the last 6 years the production has nearly doubled and imports have been reduced to about 12% of what it was 6 years ago.

Annual Report on the Mineral Production of Canada During 1915. By John McLeish. Ottawa, Ont., Canada, Department of Mines. No. 384; pp. 362.

A general explanation of the methods used for obtaining the data is first given and includes notes on some of the terms used. The production is then reviewed in a general way for the entire Dominion and occupies 33 pages. The remainder of the report is divided into metals, non-metals and structural materials. Under each of these headings the products produced are treated separately and in detail with respect to the various classes into which the material

may be divided and the locality from which it may be produced.

Fuller's Earth in 1915. By J. Middleton. Washington, D. C., U. S. Geol. Surv. Mineral Resources of U. S. II:3; pp. 4.

Its occurrence, uses and production are given. A better condition was noted in the industry during 1915 than in 1914.

Gold, Silver, Copper, Lead and Zinc in the Eastern States in 1915. By James M. Hill. Washington, D. C., U. S. Geol. Surv. Mineral Resources of U. S. I:2; pp. 14.

Conditions and production of the several metal industries with regard to the entire group of states, are first treated separately by metals. The states are then reviewed separately. It is first taken up in general for the entire state and followed by separate reviews of the counties making up the state.

Abstracts of Current Decisions on Mines and Mining. By J. W. Thompson. Washington, D. C., U. S. Bureau of Mines. Bulletin 118; pp. 74. For sale by Mining World Co., 20c.

Omitting the legal text and form, the final results and the justice of the law regarding the case is brought out. Among the general subjects treated are: Minerals and mineral lands; eminent domains; mining terms, corporations and claims; statutes relating to mining operations; mining partnerships, leases and properties; damages for injuries to miners and interstate commerce.

The Feldspars of the New England and Northern Appalachian States. By A. S. Watts. Washington, D. C., U. S. Bureau of Mines. Bulletin 92; pp. 181; illustrated. For sale by Mining World Co., 35c.

The bulletin has not been published entirely for the enlightening of topics for the mine or quarryman only. It is of value in that the manufacturer should know something more than he usually does regarding his raw products in this industry. Besides a description of the occurrence, geology, methods of mining and operations affiliated therewith, the several producing properties are briefly and separately reviewed.

The Inflammability of Illinois Coal Dusts. By J. K. Clement and L. A. Scholl, Jr. Washington, D. C., U. S. Bureau of Mines. Bulletin 102; pp. 74; illustrated. For sale by Mining World Co., 25c.

The subject has been fully covered and the results of much investigating in different fields recorded. In a similar manner to its forerunners this bulletin has analyzed the coal dusts of Illinois. The laboratory equipment is described, as are also the methods of procedure followed in making the tests. Most of the work was done with electrical apparatus. Many tables and curves have been reproduced showing the results of these tests on some of the samples. About 39 pages are devoted to the details of separate samples.

Geology of the Field Map-Area, British Columbia and Alberta. By John A. Allan. Ottawa, Ont., Canada, Department of Mines, Geological Survey. Memoir 55; pp. 312; illustrated.

For the greater part this area, covering the southeast corner of British Columbia and the southwest corner of Alberta, is not of considerable economic importance. There are, however, several districts in which economic deposits are found and these, with the exception of a few copper deposits, are of argentite, galena and sphalerite combined. The ore occurs in the fissures of shear zones in the limestones of all of the Cambrian eras and are stated as being formed by the secondary deposition from solutions. Under the heading of "Economic Geology" the mines and prospects of the country are considered. Though the above is of the greater importance to the mining profession the principal reason for having undertaken this investigation and study was because of the vast and excellent exposure of the Cambrian and other series in this district, and second because of an alkaline intrusive which is found in but few other places in the Rockies.

TRADE PUBLICATIONS.

Continuous Filters Colorado Iron Works Co., Denver, Colo. Pamphlet No. 28-B; pp. 15; illustrated.

The description contained is in the form of an article describing the use and construction of the filter. It is intended to take the place of the filter press in the sliming process. Flow sheets of plants using this type of filter are given with details of the results attainable with it. A list is given in the last pages of the pamphlet showing the different companies using the filter.

Electric Hoists. Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo. Catalog; pp 32; illustrated.

In the introduction it is stated that although several types and special design hoists not listed in this catalog are handled by the company, the catalog will well serve its purpose of bringing before the mining man enough of the various types on which he can base a request for special information. Tables, details and sectional drawings are given, besides a number of illustrations of the different types and descriptions of their unassembled parts.

"National" Mathieson Joint Pipe. National Tube Co., Pittsburgh, Pa. Booklet; pp. 71; illustrated.

This pipe is of the bell and spigot joint type. For some of its more prominent features, uniformity of material, even thickness, true diameter, absence of rivet holes and welds free from slag defects and splits, are noted. The statements are not left by themselves, but are backed with a description of the method of manufacture in which the reasons for being able to supply these qualities are brought out. It is stated that the pipe will stand 200 lbs. pressure when no shocks are apt to occur. With the probable presence of shocks a re-enforcement for the joints has been designed. Besides general discussion and information regarding the use of these pipes, tables of details and specifications are given. By curves the weight of National and cast-iron pipe are compared. The booklet is indexed and over half of its pages show suggestive views of the pipe in the field. Among these is a view showing a reverse curve made with extra fittings.

Ball Mill. The Mine & Smelter Supply Co., Denver, Colo. Booklet; pp. 30; illustrated.

In the first 10 pages the more advantageous points of the Marcy mill are reviewed. This is followed by a detailed account of what duties and results may be attained with the mill and the requirements necessary for such duties and results. It is argued that no secondary crusher is necessary with this type. In most instances the feed recommended is from 3-in. to 1/2-in. and these may be crushed to as low as 100 mesh. The capacity varies from 25 to 400 tons. As results depend on conditions they here advise that any peculiar situation be taken up with them directly as a special case. The last 15 pages contain a reprint of an article on "Notes on the Practice and Design of Wet-Crushing Ball Mills." Curves have been plotted and the information is in no way bound to the Marcy mill, but is general and will be found of use to all interested in this practice.

INDUSTRIAL AND TRADE NOTES.

The Brown Hoisting Machinery Co., Cleveland, Ohio, has taken an order from the Russian government for six wharf cranes of 30 to 40 tons capacity for installation on the docks at Archangel.

The General Naval Stores Co. of New York advise that hereafter stocks of G. N. S. flotation oils will be carried in Denver and that the company will be in position to fill orders from that point within the next 30 days. John D. Davis, with office at 1550 Glenarm street, Denver, is the company's Colorado representative. This move on the part

of the General Naval Stores Co. will be greatly appreciated, as it will permit of more prompt deliveries to western customers.

The Black Prince tungsten mill, near Boulder, Colo., recently completed and put in operation by the Denver Quartz Mill & Crusher Co. for John T. Duncan is to have an additional unit added, the necessary equipment having been ordered from the Quartz Mill Co. for delivery July 15, and when in operation will increase the capacity of the Black Prince mill to 75 tons per day.

The Metals Production Equipment Co., successor to the Quigley Furnace & Foundry Co. of Springfield, Mass., has opened an office at 530 First National Bank building, Chicago, with Earl E. Adams as western representative. This organization has long made a specialty of pulverized coal installations, such as those which have recently been brought into prominence in the mining field at the plants of the Anaconda Copper Mining Co., Canadian Copper Co. and elsewhere. The company also handles accurate temperature, heat treating and forge furnaces for oil, coal and gas fuel, as well as brass rolling mill products and gray iron castings. Mr. Adams is widely known in the mining field through his connection with the Power & Mining Machinery Co. and other similar organizations, and our readers will be interested to know of his new connection.

PATENTS RELATING TO MINING.

Miner's Tool. Ole Hanson, Lead, S. D. (1,184,746; filed March 17, 1914.)

Miner's Electric Lamp. Angelo Toler, Berwind, Colo. (1,186,454; filed April 24, 1915.)

Safety Device for Mine Chutes. John F. Hume, Redding, Cal. (1,184,958; filed Jan. 10, 1916.)

Mine Loading Machinery. Frank Billings, Cleveland, Ohio. (1,185,050; filed May 1, 1911.)

Miner's Pick. John W. Shallenberger, Canal Fulton, Ohio. (1,186,343; filed Feb. 13, 1915.)

Electrochemical Amalgamator. Samuel S. Rose, San Jose, Cal. (1,186,335; filed March 25, 1915.)

Electrochemical Apparatus. Clarence P. Landreth, Philadelphia, Pa. (1,186,106; filed Oct. 14, 1914.)

Process of Extracting Metals from Their Ores. William E. Greenawalt, Denver, Colo. (1,186,306; filed May 7, 1912.)

Process of Treating Petroleum Residues. Charles S. Palmer, Upper Montclair, N. J. (1,187,380; filed March 2, 1907.)

Metallurgical Furnace. George L. Danforth, Jr., and Samuel Naismith, South Chicago, Ill. (1,185,200; filed Jan. 24, 1916.)

Process of Preparing Pure Zinc Sulphide Solution from Zinc Ores. Shunjiro Araki, Osaka, Japan. (1,185,757; filed Sept. 6, 1913.)

Compressor. Bernhard Krämer, Charlottenburg, Germany, assignor to General Electric Co., New York. (1,185,412; filed July 29, 1913.)

Process for the Treatment of Sulphuric Acid Residues. John S. Blowski and Alfred A. Blowski, Oakland, Cal. (1,186,373; filed Jan. 30, 1915.)

Mining Machine. Albert Ball, Claremont, N. H., assignor, by mesne assignments, to Sullivan Machinery Co., Boston, Mass. (1,185,277; filed Oct. 9, 1906.)

Treatment of Ores. Frederic A. Eustis, Milton, Mass., and Charles Page Perin, New York, N. Y., assignors to Moa Bay Iron Co. (1,185,187; filed Dec. 27, 1915.)

Art of Refining Kaolin and Similar Clays for Use in Making Pottery and Like Products. William W. Simonson, Cincinnati, Ohio. (1,185,254; filed Oct. 20, 1915.)

Concentrator. Charles F. Paige, Oakland, Cal., assignor of one-third to Adolph W. Jones and one-sixth to Harry B. De Mooy, Oakland, Cal. (1,185,129; filed July 8, 1915.)

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Knik.

The right of way has been cleared from Matanuska Junction to Moose creek, and from here about 90% of the distance to King's river has been cleared. The right of way is 100 ft. wide on an average and a good wagon road has been completed beside it. A road is also being run north along the course of the main line from the junction to station 5280. An idea of the magnitude of the work under way may be gathered from the commission's last pay roll. The 1463 names on this roll are divided among the different heads of the departments—440 men are under contract; there are 121 station laborers, making a total of 2024 men. In addition to this there are 206 horses being used in various government work in this connection.

Harry Challstrop and associates have 36 quartz claims on Knik river, and development work is showing good ground. They will drive a tunnel this summer. The development work already done gives them cause for further work. The original lead was found last summer by Carlson and Anderson, who were in a party of contractors doing station work for the commission. Assays of fair samples show an average value of \$24, but the owners expect bigger values when they tap the contact. Several parties have visited the property lately with the view of buying; but no deal has yet been made.

Arthur D. Jett of Sunrise is making drill tests of his placer ground on Six-Mile creek. He is operating one drill at the present time. If the future developments prove as he expects, he will put in more drills. Jett is using a drill manufactured by the Union Construction Co., San Francisco, with some additional features that are improvements of his own and particularly adapted for the drilling of this ground.

Nome.

Spring weather is only just commencing here. The creeks are unusually dry and Bering straits is almost a mass of ice.

A report from the Marshall City district states that Jensen and Madsen have discovered good pay, insuring mining operations in that camp for some time to come. Of late the district has been changed to Fortuna Ledge. Dime creek is showing up fair and there is a small movement of prospectors to that district. Walter Johnson, representing the Union Construction Co., has taken over the Crim-Randt-O'Brien tin property at Lost river, and plans extensive development this season. The purchase price was \$300,000.

Many Iditarod operators are going to Willow creek, a tributary of Kuskokwim river. Tom Aitken was among the original locators of the ground, which is said to have evidence of a fair future.

ARIZONA.

Bisbee.

The Copper Queen Copper Co. has completed its tests by table, vanner and flotation concentration in the mill built for this purpose some time ago. The ores treated were mostly chalcocite and bornite from the locality known as Sacramento hill. The tests demonstrated that satisfactory recoveries could be made by the methods adopted, by concentrating in the ratio of 4 to 1. They also showed an ex-

treme range of values of the ores taken for test. Coarse crushing was followed by concentration over Butchart roughing tables, using Senn vanners for the slimes. The material was then reground in Hardinge mills for the oil flotation machines, consisting of Callow's and Rork's. The one most used was a modified Rork. Of the saving made, 85% was taken from the roughing tables and vanners, 15% being extracted by flotation. While no definite announcement is made by the company as to the construction of concentration mill, it is understood that future plans contemplate doing so. Gerald Sherman, general superintendent, states that when a decision for building a mill is made it will be designed for about 3000 tons capacity.

The Shattuck mine is shipping 550 tons per day of oxidized ore, running 5% copper, to the Calumet & Arizona smelters, Douglas. Special high-grade sulphide ore sampling 30% copper and amounting to 600 to 1000 tons per month, is shipped to the same smelters. Another feature of Shattuck production consists of carbonates and sulphates of lead, occurring partly as separate bodies and in other places on top of the copper bodies, making it practicable to mine it separately. Shipments of these lead ores to El Paso amount to 3 cars per week. A recent car shipment sampled 21% lead, \$2.50 gold and 3 to 4 ozs. silver. The general run of copper ore contains about 2 ozs. silver and 60 cts. gold. The workings have reached a depth of 900 ft., there being nine working levels. The high-grade copper sulphides and the lead ores are taken from the 300, 400, 500 and 600 levels. The mine is producing 1,300,000 lbs. copper per month. Those responsible for the operations are: L. C. Shattuck, general manager; Arthur Houle, superintendent; R. R. Belknap, chief engineer.

Wolverine & Arizona Mining Co. has placed Marc Bailey in charge as superintendent. He is outlining a plan for development. This group is in the southwest part of the district, adjoining properties of Calumet & Arizona, Copper Queen and Shattuck, and is controlled by Michigan people. Bailey formerly was with the Shattuck.

Higgins mine, taken over last February by Thos. Higgins, Los Angeles, is being further developed, and is a regular shipper of ore. June shipments amounted to 2000 tons. There is a wide range of values in the ore. It is a sulphide and runs 3 to 40% copper. Development is mainly from a 2300-ft. tunnel, although a shaft, now at 300 ft. depth, is being sunk. The intention is to put an electric hoist in position. J. J. Flanigan is superintendent.

Tombstone.

Bunker Hill Mines Co., a Phelps-Dodge organization, which took over the Consolidated mines at Tombstone some time ago, is mining ore on the several levels between the surface and the 600-ft. station. The main shaft is 1000 ft. deep, the present water level being at 675 ft. Sufficient water is being pumped for mill work only. The hoist is being operated by compressed air, a Nordberg compressor of 4000 cu. ft. capacity being used for this purpose. The 15-stamp mill is handling 75 tons of ore per day; one more 5-stamp battery will soon be in use. The ore is crushed in cyanide solution, the pulp passing from batteries over Wilfley tables, which take up a lead concentrate. The material is then classified, the sands passing to percolation tanks, the slimes to Parral tanks, the slimes then being washed through Oliver filters. The ore contains gold, silver, lead, zinc and iron-manganese. The mines also produce manganese-dioxide ore, of which about 150 tons per day are concentrated separately. An analysis of these ores shows a content of 25 to 30% metallic manganese, 20% lime, 18% silica, 8 to 12 ozs. silver and 0.4% copper. The concentrates produced are mar-

keted in the east. The manganese mill tailings are shipped to the Copper Queen smelter, where they are used as a flux. A small tonnage of crude ore, running 43% manganese, is shipped without concentrating to steel works in the east. Most of the ore cyanided, as heretofore mentioned, is made up of oxides and carbonates. There are some sulphide ores, however, and these are milled separately, the slime therefrom being concentrated over a Senn pan-motion vanner, which makes a good saving and has large capacity. The different phases of mill work herein indicated are in the nature of experiments, evidently designed to make determinations on which to base future operations on a larger scale. E. Grebe is manager; J. Davis, mining engineer, W. F. Tindall, metallurgist and mill superintendent.

Oatman.

The Oatman mining district continues to be the center of attraction. During the past week the Black Range Co. opened a considerable body of commercial ore on the 300 level. Drifting operations through the week are reported to have been in ore varying from \$18 to \$30 average values, these values secured from sampling across the entire face of the drift. Drifting continues in ore, and it is said that the values are slowly increasing.

Big Jim has enlarged its working crew. Drifts are being run on both the 400 and 485 levels. On the new 485 level the drift to the east is said to be in solid ore. This drift has nearly entered the rich ore shoot opened on the 400 level. Such a rapid increase in values on the 485 level prevail that the operators believe that higher values will be found on this level than on the 400 level to date.

The Pioneer reports notable developments on its 400 level. This property is controlled by Keith & Keith of Boston, and an energetic development campaign is under way. It is reported that in the south drift a body of ore averaging about \$20 has been opened for a length of 35 ft., and is 8 ft. in width. After extensive sampling of the ore bodies in the old workings of the Pioneer, the officials of the company claim that much more than 500,000 tons of mill-grade ore is now blocked out, and that more ore is rapidly being placed in sight. A mill is now in contemplation for this property.

In the United Eastern, work of blocking out ore continues, and the concrete foundation work for the 200-ton mill will soon be completed.

Persistent rumor continues that a find of ore has been made on the new 1400 level of the Tom Reed. Ellis Mallory has started on the work of preparing a complete geological map of the holdings. The annual report of the Tom Reed Co. for the year ending March 31 shows that 5718 ft. of work was done and that 29,916 tons of ore was milled, the average value of this ore being \$22.12, the extraction being 98.6%. The total was \$661,870.68, against an average of \$739,690.21 for the preceding 7 years. The total production to date has been \$5,833,702.17. Dividends paid during the year amounted to \$163,719.90, or 18% on the par value of the outstanding stock. It was estimated that 11,000 tons of ore were blocked out in stopes at the end of the year. Net earnings for the year, \$170,577.98, as compared with \$548,846.15 for the previous year. Income from other sources than mining totaled \$32,580.76, making total earnings slightly above \$200,000, or about 28% on issued capitalization. Mining and milling costs averaged \$11.21, a higher rate than ever before. This is accounted for by increased cost of labor and materials, and a more extensive development campaign.

The crosscut on the 500 level of the Ivanhoe appears to have penetrated the quartz porphyry dike which was entered some 10 days ago, the character of the rock now being extremely good, the gold values carried by much of it seeming to indicate that the vein has been entered on the foot-wall side. The operators estimate the vein to be 30 to 40 ft. in thickness, and have also expressed the belief that the highest values would be found on the hanging-wall side.

The Boundary Cone is drifting in low-grade ore to the north and to the south on the 750 level, and as the downward extensions of the ore shoot opened on the 550 level are neared slowly increasing values are reported.

Work is now being rapidly prosecuted on the Adams property, and the shaft is down about 90 ft. The success of the Black Range has greatly stimulated work on the Adams,

Nellie, Oatman Syndicate, Murdock, Green Quartz and other properties in the Black Range section.

The shaft on the Argo has now attained a depth of 640 ft., and the operators will probably carry it to the 700 point before doing further lateral work.

James C. Ray has just completed a geological survey of the Esperanza Mining Co. ground. This is the most complete geological survey which has ever been made of any property in the district, and is an exhaustive study of the geology, petrology and mineralogy of the southern section of the field.

Etienne A. Ritter has made an extensive study of the Oatman district, and in commenting upon the conditions prevailing there said, in part: "It is my belief that the Oatman district is destined to become one of the greatest gold producing districts in the United States. I believe that time will prove that the Oatman district, like Cripple Creek district, will develop a large number of heavy producers covering a very wide area of territory, rather than being a camp of two or three mines lying along one ledge. Oatman is a deep-mining district, shafts must average from 400 to 600 ft. before lateral work is started. When laterals are started they must, as a rule, be driven some considerable distance to pick up the mineral-bearing veins, and then, as a rule, considerable lateral work must be done in the vein before ore is discovered. Mineral-bearing veins of great lateral extent do not contain rich ore deposits throughout their entire length. Much vertical and lateral development must be done before pay ore in large quantities is found. Every foot of additional development work in the Oatman district brings success nearer. Therefore, in my opinion, the public should continue to have faith in the Oatman district, and those who are interested in the development of various well-located properties there should continue to manifest their faith if only by refusing to part with Oatman securities they hold prior to the time when extensive work should have proved whether or not the various properties are of genuine merit. It is my belief that those people who have faith in the Oatman district, and who are content to await and give the district time will eventually enjoy very large rewards for their confidence."

The officials of the Iowa Mining Co. have recently made an extensive investigation of their property, accompanied by their engineer, Carl O. Lindberg. The retimbering of the old 300-ft. shaft has been completed, and an active development campaign has now been started along the lines proposed. This property has quite a tonnage of ore of low-mill grade blocked out in old workings, but a depth of 500 to 600 ft. will be attained before further lateral work is done.

With its machinery equipment all in operation, shaft sinking on the property of the Oatman United Co. is being rushed night and day. The company has its own electric light plant, and is endeavoring to set a record driving its shaft to the 500 point. Charles S. Sprague, president of the Jumbo Extension Co., is president of the Oatman United, and he has retained J. K. Turner as consulting engineer.

The station on the 350 level of the Lucky Boy is completed and the operators are just starting to crosscut to their vein. Intense silification of the country rock and high gold values found in many stringers cause the operators to feel highly optimistic regarding the outcome of their development work.

CALIFORNIA.

Goldstone.

This new camp, 33 miles northeast of Barstow, is attracting great interest, following several rich strikes of free-milling gold quartz. High-grade ore is being taken from the Goldstone, Red Bridge and Lucky Find properties. None of the claims has been opened to a greater depth than 50 ft. On the Red Bridge a strong shoot of free-milling ore has been opened on surface for a length of 250 ft. As far as work has advanced the ore is free milling and of excellent character. The formation consists of shale, schist and

quartzite, with the dikes and flows composed of igneous rocks. The richest ore is found in the contact, particularly in the schist. Scores of claims have been located and are undergoing development.

Atolia.

Independent producers continue to receive \$45 to \$50 per unit for their tungsten ore, and buyers are again showing interest. The Atolia Co., said to be controlled by the Schwab interests, is still restricting production, but it is generally believed large blocks of the company's ground will be opened to lessees before the end of July. Many of the business houses here are accepting high-grade ore as a medium of exchange.

Sutter Creek.

The Old Eureka Mining Co. has purchased the Wildman-Mahoney-Lincoln group of gold mines for \$205,000. The first payment of \$41,000 has been made and preliminary work started. The property adjoins the Old Eureka mine and it is reported the two may be consolidated and worked from a central shaft.

Unwatering of the Old Eureka shaft has begun with three electric pumps. A 6-in. stream of water is thrown from the shaft and at the present rate of progress the upper workings will soon be open to prospecting. Construction of a steel headframe will soon start, a wooden temporary hoist being now employed.

Jamestown.

The Bacigalupi group of claims has been taken under bond by the Pittsburg-Silver Peak Co. from H. C. Garner and James Diamond. Sinking of a 300-ft. shaft has commenced and from the lower level crosscuts are to be driven to reach the ore body which yielded good ore in old workings. Some good ore is already showing and a pump has been installed. The company is prosecuting extensive work at the Rawhide mine and is constantly adding new equipment to the mine plant.

Tungsten City.

The concentrating mill of the Standard Co. was placed in operation last week and is turning out 72 units of tungsten concentrates daily, valued at \$33 per unit. Developments in the Aeroplane claim continues to uncover good ore and the management is planning the early construction of a tramway from the claim to the mill, at an estimated cost of \$25,000.

Yreka.

Several chrome prospects are being worked in this vicinity. Ore assaying 40 to 45% chrome is exposed at some points, and plans are being made for early shipments. In an old shaft on the Farrish mine, operated by William A. Farrish, Jr., a strong ore body averaging 42% chrome has been exposed and a small force is at work blocking out shipping material.

Redding.

At the annual meeting of the Delta Con. Mines Co. Dr. Sherman T. White was re-elected president and S. D. Furber, secretary and manager. The installation of a 50-ton mill was authorized, including cyanide equipment. The mine lies in the Dog Creek district, near Delta, and is owned by middle west people. Sufficient ore is stated to be exposed to keep the mill running for many months.

The Mammoth Copper Co. is shipping 3 carloads of zinc ore per day to Kansas smelters from its Kennett properties. Much of the ore is high grade. The Kennett smelter is turning out approximately 1,750,000 lbs. of blister copper per month. About 1200 men are on the payroll and an immense amount of new work is going on at the Mammoth, Friday-Lowden, Stowell and Spread Eagle mines.

Rich gravel is being worked on Clear creek, 3 miles southwest of Redding, by the Gardella Dredging Co. Three cleanups have been made in the past 4 weeks and the gravel is averaging 25 to 30 cts. per cubic yard.

Graniteville.

A large compressor has been installed at the Anchu mine and developments with machine drills are progressing on ore of good grade. Considerable new ground has been recently added to the productive area and the management states the property is in the best condition since its discovery. Eastern people are interested. George Mainhart is superintendent.

COLORADO.

Cripple Creek.

A good find was made by the Colonial Mines & Investment Co., now leasing on ground of Stratton's Cripple Creek Co. at Womack hill. A tunnel was being driven towards the El Paso Gold Ring property when a 4½-ft. vein was encountered. Grab samples from the face assayed \$8. This crosscut tunnel is making for the Reno vein and until it is reached the new find will remain untouched. It is thought to be an extension of one of the C. O. D. leads. The deepest workings from the former Reno shaft were 150 ft. down and the present tunnel will attain a depth of 225 ft. The tunnel is known as the Reno. It starts from the west slope of Poverty gulch and is in 500 ft. Track has been laid to the breast of the tunnel. An air line has been carried over Womack hill, from the compressor plant at the Abe Lincoln mine in Poverty gulch, and is now furnishing air for the machine drills. An electrically driven fan has been installed to ventilate the tunnel workings. No mine buildings have been erected to date, and none are necessary at this time, but an ore house has been planned and will be constructed at the portal of the tunnel, in Poverty gulch, a short haul to the Abe Lincoln loading station of the Midland Terminal and Short Line railroad.

On the Shoo Fly property, also on Womack hill and adjoining the above mentioned Stratton ground, H. M. Gilbert has made a find. He started a crosscut west from the bottom of the 110-ft. shaft. His idea was to open up the source of surface ores, underground. Driving west 30 ft., the formation changed to a sulphide, and values commenced to come in. Gilbert then started a raise into the oxidized zone still heading westward, and at a point 10 ft. farther west and 20 ft. above the level, the vein was entered. Grab samples ran \$28.60 and \$52.60 to the ton, and the ore was hoisted to surface and into the bins. Recent mine samples taken after shooting would indicate that the shoot has only been entered on its edge, for the string of colors in the pan was a good one with the gold, both rusty and bright yellow, showing up coarse. Some colors as large as a big pinhead were noted.

The Laura Lee Mining & Leasing Co. has equipped the main shaft, now 164 ft. deep, with a mine plant, including an electric hoist and compressor. General Manager Al Pierce is now engaged in sinking the main shaft an additional 136 ft., to a total depth of 300 ft. A station will be cut when this depth is attained and laterals carried to exploit the property. It is confidently expected an ore body will be entered. On the Mishey lease from the 120 level to surface sampling old workings in the main vein has revealed \$20 ore.

Work of sinking a 1200-ft. shaft on the Happy Year group has been commenced by the War Eagle Con. Co. The property is on the west slope of Bull and Raven hills. In preparation for this work a 6-drill compressor specially constructed by the Chicago Pneumatic Tool Co. has been installed at the War Eagle shaft house. An air line 1200 ft. in length has been carried over to the Happy Year. By preliminary work with hand steel the new shaft has been sunk 22 ft. The shaft, with three compartments for the manway, skipway and counterbalance, is to be sunk 8 by 8 ft. in the clear and will be square set with Oregon fir. Stations are to be cut 150 ft. apart, so that 8 levels will be turned in the 1200-ft. No lateral work will be attempted from the new shaft until a depth of at least 500 ft. is attained, and then sinking operations will be continuous. The old shaft on the Happy Year mine, abandoned by reason of its caved condition, is accredited with a production of \$40,000 from between the 200 and 400 levels. Development work is also under way at the War Eagle shaft, where thorough exploitation of this territory is in progress.

Leadville.

The Down Town Mines Co. has completed its drainage work through the Penrose shaft by reaching the 874-ft. mark. Dewatering the Down Town basin was the first of this class of work undertaken with electric power. Following the installing of the station pumping plant, mining will be taken

up in earnest. Work in the upper levels has been under way for some time, and all of the big drifts are now in shape for permanent development. Pumping equipment for installation at the bottom level has arrived. It consists of a large 4-stage centrifugal pump, with a capacity of 3000 gals. per minute against a 90-ft. head. It was manufactured by the Providence Machine Manufacturing Co., Providence, the firm that turned out all of the pumps now being used at the Penrose. A 650-hp. motor will propel the pump. This type of motor was patented by the General Electric Co. in June, 1915. The work of enlarging the station will be taken up, as it is necessary to add 8 ft. to the height of the level before installing the motor. This is to allow the greatest possible distance between the motor and the water level, so that in case of accident a relief system of pumping can be put into operation before the water reaches the motor. The station is now 16 ft. high. The flow of water being encountered in the sump is estimated to be about 1700 gals. per minute. One sinking pump, with a capacity of 1500 gals., can almost hold the water in check, so it is believed the station machine which will throw 2000 gals. will have no trouble keeping the property drained.

GEORGIA.

Dahlonega.

The Wallace mine has been dewatered by Findley & Co. and the underground workings are being sampled. One shot broke about 500 lbs. of ore that yielded two pans of specimens showing gold. The vein is larger and better than has been reported. The company is putting in an air line and hoist and will work on an extensive scale as soon as the equipment is installed. The ore will be milled at Crown Mountain mill.

A 10-ton test run is being made at the Tonson mill. The pulp passes over the plates then over a Wilfly table. They will save the concentrates and the tailings, to determine the proper treatment for this ore, which is sulphides. They are also roasting 10 tons and giving it the same treatment to find out if roasting will free the sulphides. There is a large amount of ore on the dump which shows free gold and assays \$10 to \$40. This will be milled as soon as proper treatment is decided on.

IDAHO.

Wallace.

A deal has been closed recently by Frank C. Bailey, secretary of the Spokane Mining Men's Club, and associates to purchase 152,500 shares of the treasury stock of the Vienna-International Mining Co., and they also have taken an option for 2 years on 600,000 shares of the issued capitalization, giving them control of the corporation. Bailey announces that work on the property, adjoining the holdings of the Placer Creek Mining Co., recently taken under lease and bond by him and his associates, will be resumed in a few days, after an idleness of several years. Development plans contemplate dewatering the shaft and drifting for 200 ft., on the 400 level. A shaft then will be sunk 500 ft. and drifting begun at that point. "The property is on Placer creek, 6 miles from Wallace," said Mr. Bailey. "It has been idle since the big forest fire of August, 1910, destroyed its surface improvements and machinery equipment. The property includes three patented claims and three more held by location, besides millsite, townsite and a fine water right. Its best ore showing is in the workings connecting with the No. 3 tunnel level. There is a fine shoot of galena ore carrying considerable iron opened up on the tunnel level, in an upraise to the No. 2 tunnel 90 ft. long, which is in ore all the way, and in the winze sunk to the 400 level, which follows the ore down nearly to the bottom. The paystreak is 3 ft. wide, and of shipping grade. The officers of the company are: President, F. V. Phinney, who has been the company's engineer ever since its inception; secretary-treasurer, Robert A. Marshall; directors in addition, A. B. Livingstone,

W. B. Lively and David Rosenbaum, Robert, Mack, who will be superintendent of the mine, and Bailey will be added to the board of directors at their next meeting, who will also be general manager of the company."

Immediately on being advised of the two attachment suits brought at Wallace against the Marsh Mining Co. on two notes for \$10,000 each by Charles L. Cowell and B. F. Plummer, former directors of the company, W. T. Smith of Duluth, Minn., the recently elected treasurer of the company, wired Vice-President Edward Pohlman that he would personally pay both notes, taking the same security which had been arranged with Mr. Cowell. "The matter will be adjusted in a few days," said Mr. Pohlman, "and will only emphasize the interest taken by the Duluth directors in the affairs of the company and will finally end all connection between the company and its former Missoula directors."

Mackay.

The Copper Basin Mining Co., situated in Copper basin, 23 miles from Mackay, has 4000 tons of high-grade copper ores ready for shipment. They have signed a contract with Kirschners to transport this ore to Mackay with auto trucks, of which he now has on the ground six with seven trailers. Each truck with trailer hauls 10 tons, making 60 tons to each trip.

The Idaho Improvement Co. sold to Gilbert and Bullard of Bingham, Utah, a lead-silver property, situated in Antelope mining district, about 32 miles from Mackay. This property has produced something like \$30,000 worth of ores. Gilbert and Bullard have started work and expect to push the present shaft down another 200 ft., when they state they expect to encounter some very high-grade lead-silver ore. This property was formerly known as the Weiler lead belt property.

The company has also sold to Utah parties the Canaday group, adjoining the Empire Copper Co.'s mines. This is a lead-silver property. This property is shipping a car of ore a day, which the owner states is netting him \$1000. The purchasers state that they can produce 150 tons per day from the start and that with the showing in sight, within 2 months' time they will be able to produce 300 tons at least. This property is 3 miles from Mackay.

The Empire Copper Co. has been producing about 300 tons of copper ore per day. This property is worked by the leasing system and the leasers and company together are producing more ore than the smelter will take on their present contract. This property is located 3 miles from Mackay. The company has dropped down and are now driving a long tunnel underneath all the ore bodies. This tunnel is now in something like 5400 ft. and they have cut two or three veins of a very high-grade, lead-silver ore. This tunnel, when completed, will tap the ore bodies at a depth of over 2000 ft.

The mining district adjoining and around Mackay is just now coming into its own, and prospecting is just starting; new strikes are being reported each and every day and many of the old properties are changing hands, both on cash sales and under bond and lease.

LAKE SUPERIOR.

COPPER.

Houghton.

New Arcadian will hole up to the surface from the new lode, which is thought by many to be the Old Arcadian, and an exploratory shaft started so that this lode can be mined with ease from the 50 level, where it was discovered by the crosscut from the exploratory shaft 1800 ft. south of the first shaft. The drift is so long—265 ft., and quite small, and the distance so slight to the surface—that the shaft will much facilitate the work of exploration. The little that has been opened by drifts on this lode is just as good as where revealed by the crosscut, and the copper is certainly plentiful. The sinking from the 1250, the bottom level, has been begun.

Tremont-Devon has in its third diamond drill hole, the Forrest lode, on which is located the Victoria mine, with 9

ft. of excellent stamp copper, that is far above the average amygdaloid of the district. In this hole the Devon lode, which is just above the Forrest, did not display commercial values. W. M. Gibson, who has had charge of the work here, states that directors feel that with this showing and that of the first hole where there was 11 ft. of good stamp rock grades, calls for further exploration. It is thought that in 2 or 3 months when the directors will take this matter up, that an effort will be made to induce capitalists to take the property over and explore its resources. Few properties in the Copper Country have so much promise in their preliminary diamond drill explorations, and it is probable that one of these lodes at least will prove profitable when it is sufficiently opened to disclose its average mineralization.

Carp Lake will now be thoroughly explored, as Jerry Rourke, the mining engineer, has enlarged his force to 18, and will trench over stratum and break into the cliffs where it is exposed.

Ahmeek has received the mortar block for its two remaining stamps, and also the jigs for the 7th stamp's wash and the stamp will be, unless delays occurs from unforeseen cause, in commission in about 10 days. This addition will mean about 700 tons more daily, and about 4900 tons daily for the seven stamps. It will be difficult to state when the 8th will be ready, as it will have to wait for its jigs, but it is safe to say the delay will not be long.

Contact has passed through Wyandot lode No. 8 at the depth of 1053 ft. in its 5th hole in the recent work, which is No. 21 in the total diamond drilling up to date. The vein is of the same good amygdaloidal character as in the previous holes on this lode, and the formations have been found to be most regular in their occurrence, both as to sequence and thickness, but nothing has yet been given out as to the mineral values.

Trimountain is sinking at No. 4 shaft and is below the 25th level; No. 2 is down to the 24th; No. 2 has been bottomed at the 27th for a long time. No. 2 is the southernmost shaft, as No. 1 was discontinued 4 years ago, because the distance between the shafts was so small, and the expense of sinking a shaft is quite large. As fast as either Nos. 3 or 4 reach new levels, drifts are driven to the other and to No. 2, so as to open up the ground for stoping. No. 4 has always had good ground, also Nos. 3 and 4 from the 19th level down, as has been shown by the good increase in refined copper. This mine, which is in lower grade copper than the Champion and Baltic, is increasing also its production, since the stoping is becoming greater in this new ground. The prospects for the future at this mine look very bright. There is no construction work of any great cost planned out for the future.

Wyandot's mill test is showing much better values than was anticipated and the figures are running high. Some specimens that have come from the 9th, the bottom level, are certainly very rich. These results will undoubtedly enthrall the management so that they will give the lode the most thorough exploration, both laterally and vertically. The rock is rather deceptive and when mined and on the stockpile does not show its real values.

White Pine Extension has been sinking its shaft for about 3 weeks, having discontinued this work for a time in order to complete its shafthouse. Capt. Edward Roscolla, formerly captain at the Adventure, Allouez and other properties, has accepted the same position here, and William Pollard, recently of the Wolverine, has been made master mechanic.

Isle Royale has reached the 31st level with its No. 2 shaft and is now cutting a plat there for the purpose of running a crosscut to the Portage lode, about 150 ft. to the west, when desired. There is no copper under the fault which intercepts the lode at the 29th level, but the shaft is very convenient for the mining of the Portage lode, which carries about the same average values as the Isle Royale lode, there being considerably more mass copper of different sizes, and less stamp grades. The Portage lode thus takes the place of the Isle Royale and gives good copper ground up to the northern boundary.

Houghton Copper is getting better paying values in the

northern drift on the 12th level. The crosscut driven to find the West vein that has such high grades on the Superior, is about 115 ft. in from the winze, and is still in trap, though it is thought that some favorable changes are now occurring. The crosscut to the lode on the 4th level, a distance of almost 300 ft., has just been begun. The southern drift here was rather poor, but it is thought that the northern is entering the good ground passed through in the winze.

IRON.

Virginia.

In view of the propagation of a strike at the underground mines on this range, W. J. Alcott, president of the Oliver Iron Mining Co., said that unless the miners' strike being promoted on the Mesaba range is called off within the next few days, the company will close down all operations at its underground mines indefinitely. There was a voluntary raise made by the company on Feb. 1 and May 1, 1916, so that the miners are now receiving \$3.50 per day.

Ishpeming.

The old Lake Angeline mine, lately acquired by the Cleveland-Cliffs Co., has been given a higher value by the assessors of the state tax commission. At present the mine is not being operated, because the market for the high-grade of ore contained in this deposit is too low.

At the Holmes mine a new ore crusher will soon be in position. Work at the property, the newest in the Ishpeming field, is progressing rapidly. The shaft is down 430 ft. The ore body lies at a considerable depth below this and it will therefore be some time before the body can be put in shape for production.

John Marsch has a contract for and has commenced stripping on the property of the Antoine Ore Co. This is the second contract which has been let by the company. The contract is for the removal of 50,000 cu. yds., making a total of 100,000. The new contract is a continuation east of the present workings and will extend beyond the Cornell open pit, to the banks of Lake Antoine. Marsch will finish his contract at the Indiana mine within the next 10 days. It is rumored that this contract may also be enlarged. The Indiana is mining ore, but as yet is not shipping.

MISSOURI-KANSAS.

Joplin, Mo.

Last week saw the greatest flood the mining district has ever experienced, flooding the mines, washing out bridges, roads, railroads, and destroyed practically three-quarters of the telephone connections of the entire mining district. Several plants suffered from the storm, while a number of plants were struck by lightning and two were consumed by fire. The damage was especially severe in and around Joplin, although the whole district was involved. All streams overflowed their banks and the stream valleys having mines were inundated, filling the shafts to the top, especially along Turkey creek, Center creek and Spring river and their smaller tributaries. It is estimated that about one-third of the mines were put out of commission during the earlier portion of the week. Since the recession of the waters repairs have been made and many of the properties are once more getting back to their usual producing stage.

The hoistermen's strike seems to be gradually dissolving itself into a victory for the mine operators. The decision of the operators to hire new men or train new men for positions rather than meet the demands of the strikers has resulted in fairly good working conditions. Those mines that were down are gradually resuming operation. It is reported that some of the hoistermen who belong to the union have returned to their jobs, accepting the old scale. It is believed that no mine which has been down on account of the strike will be idle during the coming week, unless it is idle on account of being drowned out by the recent flood. So far as can be learned, only one mine in the entire district has met the demand of the Hoistermen's union.

The Wahpahshosah Lead & Zinc Co. has been organized in Joplin and will operate on the sheet ground proposition

west of Joplin. The company has thoroughly drilled a 40-acre tract and has found a fair uniform sheet ground deposit running from 2 to 3% zinc and lead. The company plans the erection of a large 500-ton concentrating plant, and is pushing development of the property as rapidly as possible. Those interested in the company are: J. M. Short, Geo. W. Short, Roy Morrison and A. D. Deshong, all of Joplin, and H. A. Moore of Louisville, Ky.

The mining and milling equipment of the Gibson mine has increased very materially—sinking a new shaft, building two new hoppers, tramway and overhauling the mill. The plant capacity has been increased to 800 tons per shift. Electric hoists have been replaced with first-motion steam hoists, and the underground track system has been revised and extended to its capacity. The Gibson mine on the Metzler land in the west Joplin sheet ground district is one of the larger developed properties in that part of the field. Barber Gibson of Webb City is the general manager.

The Wade Mining Co. has taken a lease on the 120 acres of the Wade land southeast of Joplin, after developing a mine it has started the erection of a concentrating plant. The mill from the Emperor mine at Central City was purchased, and is now being reconstructed on the new lease. The company has a 45-ft. face of ore at the 90 level and expects to recover from 4 to 5%.

At Greenfield, in Dade county, some small operators who have been producing silicate ores and cleaning their ores upon hand jigs have decided to organize a co-operative milling company to handle all of their ores. Owing to the peculiar character of the ore it has been possible to clean it on hand-jigs and make a first-class concentrate; therefore, the prices paid for their ores has not measured up to the prices paid in other camps. The new organization will probably erect a new plant within the next 60 days.

Webb City.

F. C. Wallower has under construction two concentrating plants. The Cumberland No. 1 plant is in Prosperity camp and is being rebuilt to replace one recently destroyed by fire. The erection of this plant has been in record-time, and, barring failure of delivery of machinery, the plant will be completed within 40 days' time. The No. 2 plant was located on a tract of the Zinc Corporation's lease at Webb City, and will be one of the largest milling plants in the district. This plant will be ready to start operations within the next 10 days, and will handle 1000 tons of ore per day.

Barber Gibson and associates are just completing a 500-ton concentrating plant on a 40-acre lease of the Guinn land north of Webb City. The plant will have five jigs, two roughers, one cleaner, one chat jig, and a sand jig. The sludge mill will have 10 sludge tables and sufficient places reserved for five more. The company will handle sheet ground, which is typical of the North Webb City sheet ground field.

The Cisco Mining Co. has just completed a new plant on a 40-acre lease south of Webb City which will have a capacity of 1000 tons. The company is handling sheet and anticipates a mill recovery of 3%. The plant will have six jigs, two being used as roughers, and two as cleaners, while two others will rehandle all of the tailings after being reground.

MONTANA.

Butte.

In the development work between the 600 and 800 levels, which the North Butte Co. has been carrying on in the ground near the Speculator shaft, some important ore bodies have been opened up in both the north and south branches of the Sioux Chief vein. In the north branch on the 700 level a vein from 7 to 11 ft. in width and averaging fully 9 ft. has been opened up that averages 13% copper and 9 ozs. silver. At the time of Mr. Cole's recent visit, the south branch was opened, but nothing had been done on the north branch. The latter has been drifted on for a distance of over 100 ft. and the size and quality of the ore body is being

maintained. The same vein has been opened up on the 800 level by a crosscut, and on that level it shows a width of over 6 ft. that averages 8% copper and 4.3 ozs. silver. Work is now being carried on in the 600 level for the purpose of opening up the same ore body on that level and determining its extent. On this level the south branch of the Sioux Chief has been opened up and work on the development there is going forward steadily. In the North Berlin vein the last assay going East showed 4 ft. of ore averaging 8.8% copper. This vein has faulted to the west, but this work of development to pick it up again is being pushed steadily. In addition to this new development work between the 600 and 800 levels, a force of men is now at work opening up the 400 level. While the developments on the upper levels in new territory are of great importance the work at depth is going steadily forward and if there are no accidents or hindrances the Granite Mountain shaft will be the deepest shaft in the Butte district within the next 60 days. Sinking has been carried on steadily there and last month the shaft was sunk 123 ft. It is down now below the 3400 level and the management plans to carry it below the 3600 with depth sufficient for the sump at that level. The output of the North Butte is being steadily increased. The reports for the month of May show a tonnage of 48,385, from which was secured 2,000,000 lbs. of copper and 89,000 ozs. silver. Reports for June, to date, indicate that it will be a record-breaker, with a total production of copper approximating 2,300,000 lbs. The first week showed over 500,000 lbs. of copper produced.

The prediction that Anaconda will in the current year show net profits of \$45,000,000 might at first seem a rash statement, but the more one examines into the possibilities of this, the biggest single copper producer in the world, on a 25-ct. metal market, the deeper is the conviction that the prophecy is by no means a wild one. These profits would be equal to almost \$20 per share on 2,332,500 shares. Anaconda has produced from its smelter during January, February, March, April and May, 136,400,000 lbs. of copper. If the company is able to continue its monthly output at the rate of 30,000,000 lbs. it would mean that 210,000,000 lbs. covering the next 7 months would be added to the above, making the year's aggregate 346,000,000 lbs. From the above should be deducted say 25,000,000 lbs. of North Butte product upon which the company derives only the equivalent of a smelting profit, leaving 321,000,000 lbs. upon which to calculate profits on a product produced at 10 cts. and sold, say at an average of 24 cts. This would be \$44,940,000. This calculation takes no account of the profits to be derived from spelter or the income to be derived in smelting and refining the Inspiration and Miami concentrates. Silver and gold recoveries are applied as a credit against copper costs, so that of course indirectly, net profits should be materially assisted by the high silver prices of the past six months.

With the winning of its case in the suit brought by Frank Whitman against it, the Butte & Bacon Co. is preparing to start active operations. The reorganization plans of the company are proceeding satisfactorily and the \$264,000 required has been nearly all subscribed. With this completed, the company will be in shape to resume operations. All of the debts will have been paid, a working capital of \$180,000 available, the company will own outright 278 acres of patented claims and have an option on 47 acres more. There are two shafts on the property, one 860 ft. deep and the other 1000 ft. deep, which will mean a year's time saved in development.

Guided by Managing Director W. L. Creden the party of eastern and middle west capitalists, who arrived in Butte last week, were shown the mill and mine workings of the Butte-Detroit Copper & Zinc Co. Since Creden took hold of the property, which was formerly the property of the old Butte Central Co., in the late spring, the shaft has been unwatered the full 500 ft. and within 10 days it is believed that sinking operations will have been started. The mill has been overhauled and new equipment added to both this and the mine.

Delay in the arrival of the motor trucks which have been ordered by the Boston & Montana Development Co. for the transporting of the ores from the Spain mine at the

French gulch properties to the Washoe smelter at Anaconda has caused some disappointment, as it was expected that the ore would be moving early in June. It now looks as if it would be July 1 before actual shipping operations can be begun.

Although more ore was treated in the oil flotation plant of the Butte & Superior during May than April, several hundred tons less of concentrates were secured at a higher cost and the value per ton dropped \$18.24, according to the report of the operations in May, filed in the federal court in Butte. In May 50,688 tons of ore were treated at a cost of \$3.22 a ton, to secure 11,658 tons of concentrates, valued at \$65.25 a ton. In April 50,112 tons of ore were treated, at a cost of \$2.84 a ton, to secure 12,080 tons of concentrates, valued at \$83.79 a ton. During March 52,089 tons of ore were treated, at a cost of \$2.69 a ton, to secure 12,199 tons of concentrates, valued at \$93.62 a ton. In February 49,800 tons of ore were treated, at a cost of \$2.52 a ton, to secure 10,775 tons of concentrates, valued at \$93.56 a ton.

Libby.

"We have made arrangements with San Francisco parties to install a dredging plant at an expense of \$110,000 on our placer properties near here, dependent only on satisfactory results from extensive prospecting which will first be done," said E. G. Mellander of Libby, who has returned from the coast, where these arrangements were made. "We will organize a new company to take over all of the holdings we have along Libby creek, except the comparatively small amount held by the Bear Creek Placer Mining Co. We paid \$150,000 for the ground of the Libby Placer Mining Co., \$40,000 for that of the Comet Placer Co., \$60,000 for two sections of land and purchased other holdings and now have placer ground extending along Libby creek 10 miles, beginning about 18 miles from that town. Our method of operation is unique. We had no dumping ground, so the gravel taken out with a steam shovel is loaded into a car and lifted by steam engine nearly 100 ft. into a hopper that feeds into a revolving screen. This screen is 4 ft. in diameter and about 28 ft. long. The fine tailings and small gravel go through the screen and into the flume while the coarser stuff goes out at the end of the screen and onto our dump. When the dump becomes too large it may be necessary to move the coarse tailings by a car. This new plant for handling our gravel is just being finished. We will prospect by shafts, sluicing and drills before putting in the dredging plant. This prospecting will be thorough. If the dredge is installed it will handle from 10,000 to 12,000 yds. a day and is in a district where we can operate 10 or 11 months in the year. Our gravel is about 22 ft. to bed rock, and as the values lie in the lower part, we will strip off the first 10 ft. and only run the rest of the gravel through the plant."

NEVADA.

Goldfield.

Developments have been resumed on the 650 level of the Florence and copper-gold ore of excellent grade is exposed. On the 250 and 530 levels work has been in progress several months and a large tonnage is available for extraction. Equipment for the 400-ton flotation unit is being installed and the management hopes to have the plant in commission by July 1.

The Atlanta management has started a westerly drift from the 1750 level to seek the extension of a rich shoot exposed at the 1580 point. The drift will also explore the foot-wall territory west of the main lode. Considerable new work is going on in the upper workings and is opening copper-gold ore of rather low grade. It is reported Atlanta ore will be treated in the new flotation plant of the Florence Goldfield Co., but nothing of an official nature has been given out. It is also considered likely that the Goldfield Con. will devote attention to treatment of Atlanta ores, as both companies are controlled by the same interests.

Virginia City.

For the first time since 1885 direct hoisting from a point below the 2500-ft. levels has begun on the Comstock lode.

Unwatering of the mines to the 2700 point has been completed and for the first time in 30 years the deep workings are open for mining. Drifting from the 2700 level is proceeding in the Ophir and Con. Virginia, with the vein showing some fair quartz. Drifting northerly from the 2700 level of Union Con. is also advancing.

Rand.

An important strike of sulphide ore is reported at a depth of 200 ft. on the property of the Queen Regent Merger Mines Co. 406 ft. from the main shaft. A short crosscut opened a 4-ft. vein giving assay from \$17 to \$41. Late work shows both veins have come together forming a body of good pay ore, late assays showing the gold and talc gangue of the vein carrying \$12 gold and silver, whereas the best ore shows values of \$101.80 gold, 113 ozs. silver, 5.3% copper and 13½% lead, giving total value of approximately \$220. Rand has been noted for its shipments of high-grade ore, approximating \$100,000 to date. The late strike in the Queen Regent showing sulphide and copper ore is considered of great importance by the mine owners, as verifying the prediction of engineers that depth will disclose permanent bodies of payable sulphide ore. The Queen Regent has carried its shaft down another 100 ft. and drifts will be started at once to open up the new ore body on the next level. Already approximately \$20,000 worth of high-grade ore has been shipped from the mine, and the management is now making arrangements for regular shipments.

Lida.

The Florida silver mine, embracing 5 claims and a fraction, has been purchased by Theo Bros. of Goldfield, and arrangements are being made for the installation of flotation equipment. A large tonnage of good-grade ore is exposed in the Florida, but it is of refractory character. Tests with flotation have been satisfactory and it is planned to have the plant in service within a short time. The plant will also treat ore from the Theo silver-gold mine at Hornsilver. A. P. Theo is manager.

Round Mountain.

In the period from March 9 to May 31 the Round Mountain Co. handled 106,600 yds. of gravel and recovered \$40,000 in gold from the sluices. Cleaning of the bedrock will soon commence. The company is operating at full capacity with the two water-supply systems and handling gravel averaging \$1.55 per yard. In the quartz mine good ore shows in the lower workings, and the mill is running on ore from several levels.

Tuscarora.

Equipment for the 100-ton mill to be erected on the Tuscarora mines group has been shipped and the management expects to have the plant in commission in 90 days. A new process will be used and it is planned to increase the capacity to 500 tons per day before winter sets in. The property contains large reserves of silver-gold ore, and is controlled by New York people.

Luning.

With upward of 300 men employed in and around the mines the Luning district is evincing much animation. Shipments are being made from the Champion, Wedge, Houghton, Copper Queen, Never Sweat, Silver Guardian, Mayflower and several other properties. Leasing is active, the Copper Queen alone worked by 12 sets of lessees. Shipments are being gradually increased and the town of Luning is growing steadily.

The Luning-Idaho Co. has completed a new road, facilitating ore shipments from the Hahn tunnel. In the 30-ft. Conte winze carbonate and sulphide ores are showing and indications are thought favorable for the early intersection of a strong body of sulphide ore. The McDavitt shaft is down 120 ft. on the foot wall.

Winnemucca.

An important tungsten discovery has been made in the Eugene mountains, 25 miles southwest of Winnemucca, by J. McCormick of Inlay. A system of parallel veins traverses the granite-lime contact, with tungsten occurring in the form of scheelite. The tungsten-bearing area has been traced for a length of 2 miles and is a mile wide. The ore assays 1 to 25% tungstic acid. J. A. Clawson, John Gross, George H. Copley and other Winnemucca people are interested.

NEW MEXICO.

Mogollon.

At the Iron Bar a crosscut tunnel has just been completed encountering the contact 400 ft. from portal. The vein is 7 to 8 ft. wide and pans well on foot wall. Drifting on the ledge will be started at an early date.

Surface prospect work recently begun on the Queen Vein on Eberle mine has disclosed 18 ins. of silver sulphide ore which also assays well in gold, and is being shipped to custom mill. Results of development work on the Clifton mine have warranted increasing the crew. This latter property was taken over under bond and lease in May.

Socorro Mining & Milling Co.'s operations covering first half of June produced 23 bars of gold and silver bullion and several tons of high-grade concentrates. The company is tearing down part of old custom ore bins and putting in pillars for headframe of aerial tramway to Pacific mine.

Retimbering the Pacific shaft continues below tunnel level. Ore shipments to the Socorro Co.'s mill will be resumed as soon as aerial tramway has been completed.

The Socorro Power & Lumber Co. has a saw mill on Mineral creek and has been delivering lumber to the divide above Mogollon by a board flume several miles in length. A Canadian capitalist and a representative of the Pelton Co. have just visited the property and definite arrangements made to utilize the waste water in generating power. A pipe line will be extended from end of flume down to Mineral creek and will have a head of over 1000 ft. and develop 250 hp. for which there is a ready market. It is expected to have the plant in operation by last of year.

OREGON.

Canyon City.

The company operating asbestos properties on Beech creek has abandoned activities there for the time being. The quality was said to be good, but not sufficient to justify the operation of the property. It lays in small stringers and not in a large enough body. About \$6000 to \$7000 was spent in operations. Some asbestos was shipped to Portland. The last shipment was 7 tons. It has not been made public as to whether or not operations will be resumed.

Bourne.

Jonathan Bourne has disposed of his interests in the Eureka and Excelsior mines here. They have been sold, conditioned upon the properties standing an examination to be made, and for the purpose of an inspection; 30 days are allowed. The shaft will be unwatered and the entire property sampled. Carload shipments of ore will be made for determining a satisfactory method of extraction. The capital will be furnished by the American Zinc, Lead & Smelting Co. The mines were the first to be worked extensively in the district. In 1880, under the management of Captain Donaldson, a fine free-milling plant was built. The ores proved refractory, and not until some years later, when John Longmaid introduced cyaniding, were the ores treated satisfactorily. Longmaid operated under a lease and after his lease expired the mines closed down and have been idle since. The mines are developed by tunnels and a shaft. Some ore reserves are blocked out.

Sumpter.

The Virtue Co. has been initiative in introducing Oregon as a new tungsten producer. The product was obtained from the Cliff mine, about 4 miles from the Virtue mine and mill. The test run is being made on a 50-ton shipment from the Cliff mine to the Virtue mill. The Cliff was opened by Frank S. Baillie and managed by Kenneth O. McEwen, Baillie having lately disposed of his interests to W. E. King. The ore mills well and gives some promise. Five stamps of the second battery of the 20-stamp mill at the Virtue are being used on the tungsten ore. Arrangements have been

made with Manager Romig of the Virtue for a second run later.

SOUTH DAKOTA.

Lead.

During the course of development at the Bismarck mine in the Yellow Creek district, a tungsten deposit has been uncovered. It is not as high grade as that uncovered in the adjoining Wasp No. 2 ground, but is sufficiently rich to warrant continued work. It is of concentrating grade and it is expected that further development will open up enough material of this grade to warrant the erection of a small concentrator. It has been found on the surface at the dome of one of the high points on the property and will be further developed by stripping the ground for a considerable distance. The work is not being confined to tungsten development alone. The low-grade ore exposures also are being examined and sampled, with the hopes of locating an ore body of sufficient value to put the 300-ton cyanide mill in operation. To date the results have been unsatisfactory.

The Golden West Co. is enlarging the scope of its development work. It is installing an air compressor, which will be used in connection with the tunnel work. It is possible shaft sinking will be started in the future. The compressor is capable of working 5 drills. The company is proceeding with the tunnel work, designed to crosscut the ore body which was prospected by churn drill work some years ago. It is said that the ore showing has been satisfactory thus far and the management has confidence of developing a body of commercial mill grade. The ultimate development, however, will result in an extensive opening up of the ground, so as to make available an ore supply sufficient for a treatment plant of fair size.

North Homestake Co. is continuing development started about the first part of 1916. The drift along the strike of the formation is being pushed south on the 600 level and is now 760 ft. from the shaft. It is being run through slate, where more rapid progress can be made than through the quartz and schist formation of the vein. Prospecting is being carried on by running crosscuts at intervals from both sides of the tunnel, penetrating the veins, which lie east and west of the north and south tunnel. The first of these crosscuts were run 125 ft. west and 200 ft. east, respectively. The two main veins, between which the drift is being run, are 120 ft. apart and the drift lies a little to the west of its center. It is the intention to run about 200 ft. farther south, before crosscuts are again run, making the distance from the shaft to these proposed crosscuts 960 ft. The present development is being prosecuted on the theory that the northern extension of the Homestake system of veins will be found, and, so far as known, there has been nothing so far encountered in opposition to the theory. No assay results have been made public, but it is stated that the formation is identical with that of the original Homestake Co.

TEXAS.

Alpine.

Preparations are going forward for the reopening of the Big Bend and other cinnabar mines in the Terlingua district, 90 miles south of here, and adjacent to the Rio Grande, despite the unsettled condition of the border region. The Colquitt-Tigner quicksilver mine in that district, which was operated for a time several years ago, has been placed in working order and is again turning out considerable quantities of cinnabar ore. The property is equipped with a 40-ton furnace. Marlow Wells is in charge. The Terlingua camp is now well protected by detachments of soldiers and the Mexican employes of the mines do not seem to be at all disturbed by the war excitement that pervades the border.

John Harvey, an experienced mining man who came to the upper border country of Texas recently, has discovered

an ancient abandoned silver-lead mine, situated 3 miles west of the Shafter mine, in Presidio county. The *antigua* promises to be a rich producer of ore. A large body of ore that assays 45% lead, with enough silver and gold to pay for milling, has been found by an exploration of the workings. Harvey is preparing to develop the property on a large scale. The fact that the Shafter mine, which has been operated by the Presidio Mining Co. for more than 35 years, and has yielded a total of about \$15,000,000 of silver during that period, is located not far from this ancient mine, leads to the belief that the discovery may prove to be of much importance.

UTAH.

Park City.

At a meeting of the directors of the Iowa Copper Co. it was decided to increase its capital stock from 500,000 to 1,000,000 shares, 200,000 of which will go to the owners of the property, 100,000 to the present lessees, who have been working through the tunnel for the past 2 years, and 700,000 shares will go into the treasury, 300,000 of which will be for sale, the proceeds to be used for development purposes and to pay indebtedness of the company. The first development work will be the sinking of a shaft. There is a good showing of copper-silver ore. Because of a lack of means and the fear of encountering water, no effort was made to get depth, and what development work has been done has been by tunnel. The stock will be listed on the Salt Lake Stock exchange during the summer.

Eureka.

By extending the 1000-ft. level tunnel of the Chief Con. it is intended to resume development of the Plutus Co. property. Arrangements to this effect have been completed. Plutus consists of 14 claims, practically all of which are patented and are in the heart of the mineralized district in Tintic. For 7 or 8 years little or no work has been done. The Chief Con. Co. will extend its drift on the 1000-ft. level up to the Plutus, which will intersect the northerly end of the Jason claim. This will be done without expense to the Plutus Co. Upon reaching it the Plutus drift will be extended south into Plutus ground on company account. There is now in the Plutus treasury a little better than \$5000 which is available for development. A similar attempt made some time ago with the Victoria Co. failed. Walter Fitch, general manager of Chief Con., is also a director of the Plutus Co. and considerable Plutus stock is held by Chief Con.

A new compressor is being installed at the Lehigh-Tintic Co.'s property. It embraces a Norwalk 2-stage compressor of 376 cu. ft. of air and weighs 8200 lbs. It will be installed at once at the deep tunnel. Already the power company has started to string the wires from the Selma camp, a few miles south. It is estimated this will be completed by July 1. The Lehigh-Tintic is now employing a force of 5 men and when it gets its new power machines going will be in position to make a showing in the course of a few months.

Cottonwood.

The Alta Michigan Mines Co. has been incorporated for \$100,000 and has been formed for the purpose of operating on quite an extensive scale a 5 years' lease on only partially developed ground in the South Hecla mine at Alta. The block of ground is on the Kate-Hays fissure and is penetrated to depth by the Quincy tunnel. The Hays fissure has already been opened and there is some ore in sight. This ground is about 600 ft. west from the Fields-Stewart lease and is 1100 ft. southwest from the Curley-Brain lease on the Skipper fissure. The Fields lease is now producing at the rate of 20 to 25 tons a day. Copper-lead-silver ore is already showing on the block to be worked.

At the South Hecla property on Wasatch range a new find has been made at a depth of 800 ft. The vein is 12 ft. wide and is thought to be better than the Wedge, formerly considered so good. Samples of the ore show about 300 ozs. in silver, with good values in copper and lead. The ore is said by some to average \$75. It is in an east-west fissure,

dipping at an angle of 70°. The fissure is in the soluble white lime, with the overthrust 350 to 400 ft. above where conditions are ideal for a good ore body. At present about 2000 gals. a minute is gushing from the broken up limestone at this point. This will be permitted to drain off for 10 days or so, when the ore shoot will be developed. In the meantime, 3 shifts have been put on the South Hecla Extension drift. All this country has to be timbered and progress is slower. The drift is now headed for the Maix fissure.

Kelton.

The Lucky Boy Mining & Milling Co. has made its first carload shipment of copper ore. It was sorted from ore broken, and it is expected that it will run between 12 and 16% copper, 7 ozs. silver and \$1.20 gold. The company owns 6 claims, unpatented, that are being developed by a tunnel. The tunnel has been driven in 165 ft. and has cut the ore at the breast at a vertical depth of 200 ft. The ore body is 3½ ft. wide and an average of it shows 5% copper. On the dump there is about 100 tons of this class of ore broken, and the ore that is to be shipped has been sorted out of this. The ore occurs in a blanket vein lying between a large iron cropping and a porphyry foot wall. The country rock is limestone in contact with quartzite. Four miles southwest is the Century mine, from which a considerable tonnage of ore has been shipped. At present 5 miners are working on the Lucky Boy.

Bingham.

About the first part of July work will commence on the construction of the new Utah Copper Co.'s leaching plant. Plans have been completed and the site decided on. The initial capacity will be about 2500 tons and it is the intention to gradually increase the capacity as the work progresses. The plant will not be finished before the first of next year. The designs for the steel work, tanks and machinery have been completed. Just what the process of leaching is has not been announced. It will be by some use of sulphuric acid. For several years work has been carried on in the experimental department of the company for a process of leaching. A small plant has been running at the Magna plant for some time so that sufficient data has been secured for the construction of a commercial plant. About 40,000,000 tons of carbonate ore, carrying an average of 1% copper, has accumulated from the development of the mine. This has been a capping over the sulphide ores that are shipped to the mills. It is impossible to treat the carbonate ores by the same process as the sulphides, as the values will float off in the slimes and tailings.

WASHINGTON.

Spokane.

An effort is being made to revive the old Spokane Belle silver mine, 35 miles north of Spokane, near Clayton, one of the oldest mineral locations in this section, and E. H. Belden, local attorney, owner of the property, is planning to form a syndicate to finance further development. Recent assays of samples taken from the dump made during the early period of development more than 20 years ago show values of \$25 in silver, and engineers who examined the workings 2 weeks ago have advised to continue the shaft, now down about 100 ft., to 300 ft., and then crosscut to intersect two other veins that show about 125 and 250 ft., respectively, farther north. The first location of record on the Spokane Belle was made in 1887, and up to 1889 a number of location notices had been posted, but none were permanently established. In 1894, J. W. Larkin and J. B. Welch took possession, and in December, 1895, they organized the Spokane Belle Mining Co., capitalized for 1,000,000 shares at \$1 each. They began development immediately, sinking the shaft and stripping the veins on the surface. Later it was discovered that the land was in the Northern Pacific railway grant, and the railway company instituted proceedings in eviction. The suit was settled by the mining company buying the quarter section on which the claim was located, and title was finally secured in 1896. The property remained idle for 4 years, when it was acquired by

John R. Cassin and associates, who made the shipments to the Northport smelter, but they suspended operations after a few months, and no work has been done since. Belden secured possession in 1906, acquiring title from Spokane county under tax foreclosure proceedings, but it is only recently that he has considered systematic development. There is an excellent stand of timber on the land, much of it of merchantable quality, and a good wagon road provides transportation facilities from the mine to the Deer Park Lumber Co., logging railway, which is but 1½ miles distant.

A new strike, much more important than the original discovery, is reported to have been made June 20 in the Electric Point mine, near Northport. The drift south from the 210-ft. shaft level, or 242 ft. below the outcrop, has broken into the No. 2 ore chimney and reports received state that the deposit has been penetrated for 18 ft., exposing solid galena and mixed carbonates and crystals. The silver values also are much higher than in No. 1 chimney. The remarkable feature of the strike is the presence of so much crystallized lead in the carbonate ore in the No. 2 chimney as to raise the grade from an average of about 22% in the first chimney to 50% in the newly opened ore body. The No. 2 chimney was found on the surface at a point 40 ft. south of the discovery chimney. It has an apparent diameter on the surface of 25 ft. The drift which has broken into it at 240 ft. of depth is just 40 ft. long, and has been in ore for 18 ft. Two men working half a shift took out of the drift 1½ tons of galena and 4 tons of carbonate ore. The galena ore is worth \$75 a ton net, and the carbonate ore about \$50. Northward 180 ft. from the original discovery chimney, which was 35 ft. in diameter at the surface and circular in form, and 59 ft. in diameter at the 100 level, is a third and apparently much larger chimney than either of the others. Without being fully stripped it shows a diameter of 60 ft. The drift from the discovery shaft, which is being run to tap this ore body 250 ft. deep, is now nearly half completed. Shipments from the mine are being made, and five 4-horse teams are now hauling to Boundary, the ore going to the smelter at Trail. President Roy A. Young says he will have 10 teams and a motor truck moving ore by the first of July. Only galena ore will be shipped for the present.

Walter J. Nicholls & Co., of Spokane, who recently acquired options on a number of properties adjoining the Electric Point mine near Northport, following their purchase of a quarter interest in that property, are organizing a syndicate to take over a group of 10 claims which they have started to develop under the direction of Larson & Lakes. A report made on the property by Larson & Lakes states that several promising showings of carbonates, similar to some of the outcrops on the Electric Point, have been exposed on the syndicate's holdings, which nearly surround the Electric Point mine.

WISCONSIN-ILLINOIS.

Platteville.

Returns covering operations at all points in the field for the week ending June 24 show delivery of 142 cars of zinc concentrates, all grades, 5732 tons; 4 cars lead ore, 225,780 lbs., to Federal Lead Co.; pyrites to General Chemical Co. from National Works, Cuba, 610,800 lbs. The gross yield raw concentrates for the week aggregated 9,000,000 lbs.; net deliveries to smelter, 5,316,000 lbs. The base price on blende dropped to \$75. Top grades ruled at \$77. The base ranged down to \$70 for seconds and medium grades, while low-grade in hands of independent operators was not in demand. Much low-grade reserve in the field will come in for separator treatment through co-operative separating plants.

Kistler-Stephens Co., operating with a complete new electrically driven 200-ton milling plant on the Block-House mine, have two bins of 50% concentrates for a trial run of the plant. Chas. Kistler, one-half owner of this property, predicts a recovery of 80 tons of concentrates per 24 hours. This company purchased the Weigle farm of 113 acres and has located big deposits of zinc ore with drills following

months of steady work. On the Alderson farm, 2½ miles southwest of Platteville, a new zinc producer has been developed for this company. The Enterprise Roasters, now in control of Kistler-Stephens, is running with newly installed Dings magnetic separators, and making 3 to 4 cars of high-grade ore weekly. Two cars were sold last week to the M. & H. Zinc Co., LaSalle; 4 cars are held in bin. At the independent zinc ore refinery on the Homestead, known as the Climax Mining Co., composed also of Kistler-Stephens interests, 100 tons of high-grade dressed ore is ready for shipment. Two newly installed Dings machines have been added to the old equipment. Seven cars of green concentrates, held at the Grant County mine, affiliated with the Climax Mining Co., will be delivered to the Homestead separators for treatment. The Grant County mine, after unsuccessful attempts by several mining companies in the past 10 years to develop a producer, is under the management of the Kistler-Stephens Co., making a producer. The ore beds are wider and higher than ever shown before, and a heavy output is now assured.

The Bell Mining Co. is constructing a power and concentrating plant. Klar-Piquette, M. & H., Star, East End, Lodge and West Hill Mining companies are all producing. The West Hill paid a 20% dividend June 8. The Goodfellow Mining Co. is a new mining organization. Wisconsin Zinc Co. is drilling on the Carl farm, and the Goodfellow Mining Co. on the Boll farm. Maple Glenn Mining Co. is engaged in sinking a shaft.

Linden.

The Linden Zinc Co. has secured the plant at Cuba and 20 men have been put to work.

The Spring Hill Mining Co., a recent incorporation, is engaged with 30 men in shaft sinking and mill building; 32 borings on the range are in good ore, few blanks being drawn. Chas. W. Singer, general manager in charge, is authority for the statement that the output will be a 30-ton car of 50% concentrates daily.

Shipments for week of June 24 included a car from Stoner Bros. Co., 25 tons; Ross Bros. Mining Co., 2 cars, 63 tons; Optimo No. 3, 3 cars, 92 tons; Saxe-Pollard Co., 3 cars, 93 tons, all to Mineral Point Zinc Co.; Linden Development Co., 1 car to Cuba, 40 tons.

Benton.

The Sally Mining Co. is now in complete running order, with a new power and milling plant. Chas. Lawyer, et al., of Madison, have secured the mining rights to the Chas. Smith farm and a drilling machine has been put to work. Longhenry Bros. Mining Co. has begun to move concentrates to track, selling 1 car to the Benton Roaster Co. and 3 to the Mineral Point Zinc Co. The Grand View Mining Co., recently incorporated and composed of Indianapolis men, is now operating with a new rig. The Frontier Mining Co. reports a rich strike of jack on the James Horsley farm. One Garford auto truck in 6 days' hauling delivered 520 tons of zinc concentrates to track. The best day's record was 109 tons. The distance covered is 8 miles. The Field Mining & Milling Co. will remill the tailings piles at the Crawlhall mine. The Wisconsin Zinc Co. has installed a sludge mill at the Champion mine, 6 tables proving a most efficient factor in extraction of values from slimes and overflow.

Shipments of zinc ore last week is the second best on record, 61 cars, 5,146,000 lbs. Frontier group to Grasselli Chemical Co., 449 tons; New Jersey Zinc to Mineral Point, 9 cars, 372 tons; Fields Mining & Milling Co. to Galena Refinery, 7 cars, 285 tons; Longhenry Bros. Co., 3 cars, 122 tons, to Mineral Point, and 1 to Benton Roasters, 41 tons; Blackstone, Martin and Kittoe mines of the Vinegar Hill, 9 cars, 400 tons; Indian Mound Co. to Wisconsin Zinc Roasters, 8 cars, 300 tons; Wisconsin Zinc Co. to American Zinc Co., 3 cars high-grade, 133 tons, and 6 cars to Lanyon Zinc Co., 270 tons; Champion mine to Galena, 4 cars, 201 tons.

Shullsburg.

McDermott Mining Co. is engaged in sinking a new shaft and pumping machinery has been installed. The Wisconsin Lead & Zinc Co. has secured mining rights on the Weatherby, Richards, Howe and Stephens farms. The Oli-

ver Mining Co. has a zinc producer developed on the Mulcahy farm, power and milling plant, and a magnetic zinc ore separating plant will be added to the surface equipment. The Vinegar Hill Zinc Co. is engaged in drilling out the Thos. Doyle farm. The Wisconsin Zinc Co. is engaged with drill on the Jos. Copeland estate. Drills are working for the Fields Mining & Milling Co. on the Harty farm. Drills are at work on the John Lyon's farm. Metcalf Bros. Mining Co. has secured the mining rights on the Thos. Cherry homestead and ore is now being raised. The State Line Mining Co. has a lease on the Beckwith farm and good success is following drilling. The Mineral Point Development Co., a new organization, is also engaged on the Beckwith farm, and one drill is engaged.

The Winskill, an old-time producer, is shipping again, last week clearing 3 cars for Galena, 147 tons; Rodhams Mining Co. to Lanyon Zinc Co., 31 tons. The Rodhams mine has struck it richer than ever before.

Potosi.

The Wilson mine resumed operations last week after making big improvements to its surface. One car high-grade blende was shipped to LaSalle, 35 tons.

Galena.

Shipments showed improvements last week, the Black-Jack shipping 4 cars, 170 tons; Federal to roasters, 2 cars, 81 tons; Galena Refinery Co., 4 cars high-grade, 110 tons; North Unity to Cuba, 43 tons; Wisconsin Zinc Roasters, 2 cars premium ore to LaSalle, 80 tons; 3 cars to Edgar Zinc Co., 120 tons. The Vinegar Hill Zinc Co. put in operation a new 200-ton plant on the Graham mine. Wisconsin Zinc Co. completed a 200-ton power and milling plant on the Birkbeck. Wisconsin Zinc Roasters received during the week 21 cars raw ore for separator treatment, 892 tons.

CANADA.

BRITISH COLUMBIA.

Granby.

The Granby Con. Mining, Smelting & Power Co., with mines at Hidden Creek and Phoenix, and in Alaska, and smelters at Anyox and Grand Forks, on June 21 declared the regular quarterly dividend of \$1.50 a share and an extra dividend of 50 cts., a total of \$299,970, payable Aug. 1 to stockholders of record July 14. This will make the payments for the current year \$749,924, and will increase the grand total to \$6,476,847. No official announcement has been made as to plans for permanently increasing the quarterly disbursements, but local stockholders are of the opinion that from now on until there is an appreciable decline in copper prices that Granby will continue to pay \$2, or 8% annually on the outstanding capitalization, 149,985 shares at \$100. Net profits of the Granby for the last quarter of 1915 were \$1,026,745. For the first quarter of 1916 they approximated \$1,200,000 and during April were estimated at \$600,000. For the fiscal year ending June 30 they will considerably exceed \$3,000,000, which is more than \$20 a share of issued capital stock. In the same period there will have been disbursed only \$6 a share, the first dividend at the 8% rate falling in the first quarter of the next fiscal year. On Jan. 1 the company's surplus stood at \$962,104. By June 30 it should be in the neighborhood of \$3,000,000. Granby's plant at Grand Forks is capable of caring for the output of the Phoenix mines, besides handling custom ores, but the Anyox plant is being enlarged to accommodate the rapidly increasing production at Hidden creek. The Anyox production of copper matte amounts to 3,000,000 lbs. monthly, and nearly every steamer that docks there carries away a part of a cargo of the metal. At present the mechanical equipment of the smelter is being actuated by a hydro-electric station, but during the winter this is uncertain, and the company now is installing an auxiliary steam power plant that will cost about \$750,000.

Hedley.

The Hedley Gold Mining Co. on June 11 declared the regular quarterly dividend of 3%, or \$10,000, and an extra dividend of 2%, or \$20,000, a total of \$60,000 on the issued

capitalization of 120,000 shares at \$10 each. Disbursement was made on June 30th, to stockholders of record June 24, and the transfer books will not be closed, according to the announcement from John D. Clarke, assistant treasurer, at the head offices, No. 42 Broad St., New York. This will make the payments for the current year \$120,000 and will increase the grand total to \$1,943,520.

Nelson.

W. R. Salisbury of Salmo has taken a bond for \$50,000 on the Neptune and Underhill claims on Bear creek in the Sheep Creek district, about 40 miles from Nelson. The properties have been owned by E. Sapples of Salmo and Michael Scully and J. Campbell of Nelson. They are said to have a fine showing in silver-lead-zinc ores. These claims have been worked and opened up enough to give reliable information on their values. Sapples, chief owner, is the postmaster at Sheep creek, and has been employed with the Queens mines of that district.

ONTARIO.

Cobalt.

According to the May report of Nipissing arrangements are being made to reopen shafts Nos. 86 and 123. Small tonnages of low-grade are blocked out here and are in condition to be stoped. The company mined ore valued at \$291,898 and shipped bullion, including that from custom ores, with a net value of \$420,822.

Little information has been available regarding the Mining Corporation of Canada. A recent report shows that the silver production of the past year amounted to 4,563,956 ozs., against 3,185,124 ozs. in the 9 months ended Dec. 31, 1914. The production for the same period of Nipissing Mines was 4,097,391 ozs., which demonstrates that the Mining Corporation is in the lead as a silver producer. As the corporation was only operating 9 months in 1914, comparisons between 1914 and 1915 are hardly possible, though, judging by the figures, the rate of production was considerably higher in 1915. Of the total production in 1915, 1,584,986 ozs. were derived from 766 tons of high-grade ore and 2,922,383 ozs. from 131,853 tons of low-grade. In the case of the high-grade, the Cobalt Lake property showed a very substantial increase. Whereas the Townsite-City properties contributed 408 tons in 1914, and only 397 in 1915, the Lake property's output rose from 78 to 369 tons. In low-grade ore, however, the reverse was the case. The yield per ton increased from 29.66 ozs. in 1914 to 34.3 ozs. in 1915. This was due in part to the higher grade of the milling ore obtained from the Cobalt Lake mine, in part to improved extraction methods and in part to the introduction of the new operation of cyaniding slimes. The average price obtained for silver was 52.53 cts., against 51.17 cts. in 1914. Combining the higher yield and the increased price, the revenue per ton realized rose from \$15.20 to \$18.10 between the 2 years. Working costs which were \$8.10 per ton in 1914 were increased to \$8.51 in 1915. Profits were accordingly \$10 per ton, or \$7 higher than in 1914. The estimates of ore reserves in the three principal mines are 101,135 tons, 17,000 tons less than at the end of 1914, with 3,937,995 ozs. of silver content, about 63,000 ozs. less than 1914.

MEXICO.

Nacozari.

The Nacozari Con. Copper Co., John G. Alexander general manager, is considering changes in its mill, to provide for concentration with tables and oil flotation. Plans also contemplate a new electric power plant to be driven by oil engines. The character of the ore is shown by a 25½-ton shipment of ore and concentrates to the El Paso smelters in May, which sampled as follows: Lead, 10%; silver, 115.3 ozs.; copper, 1.3%; gold, 0.05 ozs.; iron, 6.6%; zinc, 13%; sulphur, 15%; lime, 11.6%; insoluble, 41%. After deducting freight and smelting charges, this shipment netted the company \$1811.31. The mine is developed and operated through a 2500-ft. haulage tunnel, which is to be extended. The company's main office is at Douglas, Ariz., at present.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallography, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc).

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

I. GEOLOGY

GEOLOGY AND MINERALOGY

Geology

Gudgeon, C. W.—*The Scheelite-Gold Mines of Otago, New Zealand*. [The geology is taken and several properties described. Mill flow-sheets and milling and mining costs are given, besides a brief on a wet method for assaying pyritic scheelite for tungsten].—*Proc. Aus. Inst. M. E.*; N. S. No. 21 1916; p 37; pp 14*; 65c.

Watts, A. S.—*The Feldspars of the New England and North Appalachian States*. [Contains description of the geology and separate descriptions of the quarries. Tests for the feldspar are given, as are methods of quarrying, pumping, crushing, concentration, etc.].—*U. S. Bur. of Mines Bull.* 92; pp 181*; 35c.

—*Zinc Ores, Their Occurrence and Utilization*. [Descriptions of the deposits in various countries are given briefly. Prices of the ore and methods of computing its value are given as well as costs of smelting and methods for the same].—*Bull. Imperial Inst., London*; p 44; pp 57; 75c.

II. ORES AND METALS

(I) METALS AND ORES

Alloys

Barnitz, H. L.—*The Technical Production of Hydrogen and Its Industrial Application*. [Reprint from *Met. & Chem. Engg.* It is used to make the oxy-hydrogen flame for welding. Several different processes are described in general and some details given].—*Barnitz, New York*; pp 11; 30c.

Moulden, J. C.—*Zinc, Its Production and Industrial Application*. [The different kinds of zinc are taken up and their uses reviewed. A separate table is given showing the many alloys and their proportions and followed by an account of zinc production for 1913 to 1845].—*Jnl. of Royal Soc. of Arts* June 2 1916; p 517; pp 15*; 35c.

Copper

Hill, J. M.—*Gold, Silver, Copper, Lead and Zinc in the Eastern States in 1915*. [The industry and production is reviewed separately for the entire group of states by metals and is later reviewed by states and counties].—*Min. Res. of U. S.* 1:2; pp 14.

Mathewson, E. P.—*Recent Improvements in Concentration at the Washoe Reduction Works, Anaconda, Montana*. [A general detailed description of the crushing and concentration operations in connection with flotation. A flow-sheet is given].—*Canadian Mg. Inst. Bull.* June 1916; p 560; pp 9*; 35c.

McLeish, John.—*Annual Report on the Mineral Production of Canada, 1914*. [Each mineral is reported on separately. The imports, exports, production and condition of the trade are given].—*Canada Dept. of Mines, Mines Branch No.* 354; pp 362.

Gold Fields and Mining

Alderson, M. W.—*Mining Possibilities in Colombia, South America—II*. [A general talk on mining in this well-known and old country. Placers are the principal deposits considered].—*Mg. World* June 10; p 1075; pp 2¾*; 10c.

Cundy, W. H.—*Bendigo Goldfield: Its Underdeveloped Resources*. [Abst. from *Mining & Engineering Rev.*].—*Monthly Report Chamber of Mines, Victoria Aust.* Mar. 1916; p 63; pp 5¾; 35c.

Gudgeon, C. W.—*The Scheelite-Gold Mines of Otago, New Zealand*. [The geology is taken up and several properties described. Mill flow-sheets and milling and mining costs are given, besides a brief on a wet method for assaying pyritic scheelite for tungsten].—*Proc. Aus. Inst. M. E.*; N. S. No. 21 1916; p 37; pp 14*; 65c.

Year.....	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Conditions in copper have undergone no startling change since our last report. In fact, there has been such an absence of developments that it is difficult to place before readers a word picture of the situation. Demand for copper has been spasmodic and coming mostly from foreign sources. One of the allied powers came into the market for several lots ranging from 100 to 500 tons, all of whom strived to secure 26 $\frac{1}{2}$ cts. for electrolytic for July delivery, but failed to secure a better quotation than 26 $\frac{3}{4}$ cts. from resellers. It is therefore evident that even second hands are now holding firm to a certain level of prices. The fact that some foreign buying is now being done is not taken to indicate that copper is needed abroad, the current buying being mainly an effort to draw out some round lots of resale metal, rather than to force the hands of producers. Domestic copper demand remains entirely absent.

The over-bought condition of the large consumers renders them impotent as factors that may bring a renewal of demand. The producers admit that foreign business alone can be depended upon to create the initial momentum to carry the high tide of copper prosperity well into 1917. Some of the large producers do not expect foreign business to develop before August and possibly not before October. It is evident that the warring nations do not plan to pay high prices for metals unless they are reasonably certain of the war continuing for another year.

Some of the smaller producers lowered their prices slightly on forward deliveries quoting 29 $\frac{1}{2}$ cts. for August, 29 $\frac{3}{4}$ cts. for September, 29 cts. for October, 28 $\frac{3}{4}$ cts. for November and 28 $\frac{1}{2}$ cts. for December. The larger agencies are quoting $\frac{1}{4}$ ct. above these figures, but in neither case has there been business of a supporting nature. Resellers offered electrolytic for July freely at 27 cts., while for August and September second hands offered at 26 $\frac{3}{4}$ cts. Casting copper has also been affected by resellers, liquidation spot being offered down to 24 $\frac{1}{2}$ cts., with forward deliveries at 24 cts.

Export figures are still being studied with interest. Exports reported from Atlantic ports since the first of the month total 26,798 tons, so that with gulf ports and Pacific coast shipments to be added it is more than likely that June exports will come close to 35,000 tons. In order to co-ordinate with the reported heavy foreign buying exports must run between 35,000 tons and 40,000 tons over the rest of the year. Figuring production at the rate of 190,000,000 lbs. a

month, exports of this volume added to domestic consumption, leaves little surplus material going into stock. Domestic absorption is placed at 120,000,000 lbs. and exports at 65,000,000 lbs. It is now definite that a monthly output of 20,000,000 lbs. in Mexico will be lost until the difficulties are settled.

After maintaining a steady downward trend the London market showed some recovery in standard, but not in electrolytic copper. Standard spot dropped to £97 and futures to £95, while since they have advanced to £102 for spot and £99 for futures. American electrolytic declined £10 to £130 at London last week, which would be equivalent to about 27 cts. New York.

Quotations for copper per pound at New York for the week ending June 28 were as follows:

Tin.—Aside from a sudden influx of buying orders, which came on Friday, the market has been dull, with prices steadily declining. The purchases for forward deliveries were made when the London market came higher after a steady downward movement, and it was thought that the bear campaign had been brought to a close. Later developments indicated that this surmise was amiss and the market once more lapsed into dullness, with prices easing off. The situation in tin is varied. The spot position is heavy, due to excessive arrivals and the ample supply held by users. The forward position is uncertain. Consumers intimate that greater supplies of Banka and Chinese tin should affect Straits, and therefore are waiting until Straits' producers are ready to make prices more favorable. The point is whether consumers can hold out long enough. Our consumption has increased heavily, due to greater tin plate production and larger use of solder in automobile plants. Spot tin eased off to 39½ cts. Straits and 38 cts. for Banka, while spot Chinese 99.80% was quoted at 38½ cts. Lamb & Flag 99% could be had at 38¼ cts. on the spot. Straits tin for July delivery was quoted at 39¼ cts., with August offered at 39 cts. and September and October at 38¾ cts., with November and December at 38% cts.

Arrivals of tin since the first of the month total 4870 tons. The *Rotti* arrived a week ahead of time with 1350 tons Banka tin, thus flooding the market. The stock afloat to this country totals 2727 tons. Adding Atlantic arrivals of 4870 tons to 2468 tons, the stock on June 1

Tin at London and Singapore has been declining steadily, except for the brief upturn at London on Friday and at Singapore on Monday. The Singapore market dropped £7 15s last week, but advanced £5 to £179 5s at the opening of the current week. Straits tin at London receded £1 5s last week, with an additional decline of £2 10s on Monday, bringing the price down to £174 5s. Straits tin at London at £174 5s is equivalent to 37.10 cts., while Singapore at £179 5s is equivalent to 38.05 cts.

Quotations for tin per pound at New York and per ton for Straits at London and at Singapore for the week ended June 28 were as follows:

Lead.—Active foreign buying of lead helped to restore the market and prices are now holding very strong at the top. Russia has been the principal buyer, although other European countries have also made purchases. The Russian government took 1600 tons for early shipment, with 400 tons taken by other countries. This absorption was mainly done around 6.90 cts. New York and in a measure will materially assist the principal producer in adhering to its price of 7 cts. New York, which will become the average for June. In the outside market prices after receding to 6.75 cts. New York, and 6.65 cts. St. Louis, recovered 10 points. Domestic buying has been limited, but the A. S. & R. Co. is understood to have taken some good-sized orders on its average price contracts. Lead producers still feel that the metal will hold its own for months to come. Expectations are that more shrapnel contracts will be placed in this country, which would boom the lead market, but up to the present the Allies have confined their shell contracts to explosive and not shrapnel shells. At London the market declined quite sharply, spot

closing £1 17s 6d lower and futures £2 5s lower than the opening prices last week.

Quotations for lead per pound at New York and per ton at London for the week ended June 28 were as follows:

	New York		London

Lead Ore.—A water spout the first part of the week ending June 24 hindered production to a certain extent in the Missouri-Kansas-Oklahoma district. The Galena, Joplin and Webb City camps were among those most affected. Prices were down, registering \$75 to \$77.50, and there were produced during the week 2,074,640 lbs. of concentrates. This brought the total production for the year to date at 54,119,082 lbs. and these had respective values of \$79,469 and \$2,422,349.

Zinc Ore.—A better tone was noted in the market for these ores in the Missouri-Kansas-Oklahoma district. The top price for the week ended June 24 remained as during the previous week, at \$90, but the prices for lower grades was up \$10 to \$70 per ton. Production for the week was 12,092,880 lbs. of concentrates and for the year to date was 349,724,764 lbs. The respective values for these productions were \$474,356 and \$16,842,369.

Calamine continued in fair demand at \$52.50 to \$65 and there were produced during the week 389,200 lbs. of concentrates. With this production, the total for the year to date was 18,745,720 lbs. and the values for the same were \$10,670 and \$698,408.

Spelter.—The market has been utterly devoid of business and the fact that prices have only been lowered moderately is due to efforts of sellers to hold up the market, although it is generally known that at all times quoted prices can be shaded. Thus spot is held at 12 cts. New York and 11¼ cts. St. Louis, with sellers willing to take ¼ ct. less. The absence of business is beginning to affect the higher grades, on which an official reduction in prices has been

announced. Consumers are closely watching the situation, and it is evident that good buying will develop as soon as prices reach what users feel is rock bottom. Galvanizers are extremely anxious to restore their trade, but withal are not acting hastily. Brass makers are well supplied and can remain out of the market for several months to come. Spelter for July delivery was offered at 11½ cts., with August at 11¼ cts., September at 11 cts. and last quarter at 10 cts. The decline at London last week was moderate, spot dropping £2 and futures £4.

Quotations for spelter per pound at New York and per ton at London for the week ended June 28 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—There has been a sharp recovery in values, with an active demand from both domestic and foreign consumers. Prices have advanced to \$80 a flask, at which level some dealers have bought, while retailers asked \$85 a flask. The turn in the market was accomplished by English buying. With quicksilver selling at \$80 a flask in London and the market here prevailing at \$68, purchases for export could be made. While the market has recovered, it is not expected that the \$300 price will again be witnessed. Consumers realize that the metal is closely controlled. The banking interests who forced the price reaction by liquidation have completely sold their holdings, but one other banking interest now holds 1000 flasks. The Swedish and Danish governments were buyers of quicksilver last week.

Antimony.—Chinese and Japanese producers of antimony are industriously circulating reports of an active demand, but close investigation develops the fact that business is almost dormant, with sellers willingly taking large and small orders at 18½ cts. for good brands on the spot. Large consumers have had their fingers burnt severely by the rise in antimony and when it is considered that the Chinese and Japanese can sell at 9 cts. with a profit, there is no disposition among users to buy any further supplies. Many consumers are accepting deliveries of antimony for which they arranged to pay from 35 cts. to 40 cts., and dealers who also bought when prices were high are accepting their losses.

Aluminum.—Demand for spot virgin ingots continues quite active, with prices firmly held at the recent advance, viz., 63@65 cts. a pound in ton lots. Sellers quote pure 98-99% remelted at 61@63 cts. and No. 12 alloy remelted at 50@52 cts. Prompt aluminum sheets are firm, higher, and in demand, with sales made at \$85@100.

Pig Iron.—Foreign business continues to be the sole feature of the market, Italy and France taking large amounts, while latterly Spain has come out for a round tonnage of steel-making iron. Domestic business has been quiet, with resale iron affecting the resumption of demand, as consumers will not pay furnace prices when resale iron can be had at \$1@2 less. Thus Birmingham resale iron has been offered at \$13 as against \$15, the furnace price, while at Buffalo resale iron has been sold at \$17.25, with the furnaces asking \$18.50. The recent large domestic purchases were done with resellers.

Ferromanganese and Other Alloys.—Offerings for

ferromanganese for fourth quarter delivery by domestic furnaces at \$175 for 80% have been noted. As the English makers have been asking \$200 for this period it is certain that domestic producers will receive the bulk of the business to be placed unless the foreign makers lower their quotations. One of the English producers instructed its agent to offer 1917 contracts at \$172 seaboard, a reduction of \$3 a ton, but as domestic furnaces are expected to take business at \$125 to \$150, the weak effort to stimulate business caused laughter. Speigeleisen has been fairly active for the second half, with sales at \$50 furnace for 20%. Ferrosilicon continues unchanged at \$83 to \$85 Pittsburgh for 50%.

OLD DOMINION COPPER CO.'S CONCENTRATING PLANT.

The Old Dominion Copper Co.'s Operations

By W. A. SCOTT.

The main shaft "A" of Old Dominion Copper Co., Globe, has five compartments—two for skip hoisting, two for cages and one for pump columns, steam lines and electric cables. Hoisting in cars has given way to hoisting by $3\frac{1}{2}$ -ton skips. Ore and waste pockets are maintained on the 8th, 12th, 14th and 16th levels. The ore being hoisted to the surface amounts to 1200 tons per day—700 tons being concentrating ore and 500 tons smelting ore. In addition to this a big tonnage of waste is being raised. The principal ore production of the mine is from the 1200, 1400 and 1600-ft. levels. The most of the smelting ore is taken from the west side of the mine, the concentrating ore coming mostly from the east, or United Globe side. Mining and development work is progressing in the Grey mine, in which are the most easterly workings on the Old Dominion vein. Drifts are being pushed east-

ward from Grey shaft on the 10th level to open the vein between the Grey and the Arizona Commercial Co.'s Copper Hill shaft. Development is proceeding in the west section of the mine on the 17th and 18th levels, and soon the footwall extension drift on 18th level will be connected with shaft "A." Three-ton locomotives are used on the 12th, 14th and 16th levels for hauling ore in 20-ton mine cars to skip pockets at the shaft.

The water flow in the mine, which reached its 1916 maximum of 11,000,000 gals. per day in February, has decreased to 6,500,000 gals. Plans are made for installing emergency centrifugal pumps on the 10th and 12th mine levels to supplement the existing station pumps on the 12th. Within the last 6 months the separate pump shaft has been connected from the 10th level to the surface. In the next few months

CRUSHER, SAMPLING, MACHINE, POWER AND OTHER BUILDINGS SURROUNDING "A" SHAFT, OLD DOMINION.

OLD DOMINION CRUSHER AND SAMPLING PLANT.

OLD DOMINION CONCENTRATES DEWATERING PLANT.

HEADFRAME AND OTHER EQUIPMENT SURROUNDING OLD DOMINION "A" SHAFT.

this pump raise will be lined with reinforced concrete, and soon thereafter all lines, columns and cables will be transferred from main shaft "A" to this pump shaft. The latter is 7x7 ft., designed to carry a cage in the center, leaving room for water columns, steam lines and electric cables in the corners and next to the walls. It is to have a depth of 1400 ft. and will be dry and fireproof.

Further plans contemplate installing skip-hoisting

OLD DOMINION SAMPLING PLANT.

equipment at the Kingdon shaft, skip pockets having been already cut out for this work.

At the concentrator, 800 tons of ore per day is being milled, 300 tons per day of slime product being concentrated by oil flotation, the equipment for which consisting of a 16-box Minerals Separation machine. The flotation concentrates are thickened and dried by an Oliver filter, reducing the moisture to 17%. A new flotation unit is to be installed in the near future to supplement the present unit. Old Dominion water concentrates, amounting to 100 tons per day, and flotation concentrates amounting to 30 tons per day, are

being shipped to the International smelter at Miami. The mill recovery of 87.7% is divided as follows: Jig product, 41.7%; table and vanner saving, 26%; flotation product, 20%. The coarse table concentration is over Deister Concentrator Co.'s tables, these receiving material from Deister cone classifiers. A new feature of equipment consists of four Senn pan-motion vanners, which are handling the overflow slimes, receiving their feed from Allen cone classifiers. Special tests made on a Senn vanner, prior to installing these four machines, showed exceptionally high capacity and a satisfactory recovery. The five Hardinge mills are used for fine grinding, and a Marathon mill is being installed for similar use.

The Old Dominion smelter, having three blast furnaces and a 12-foot converter shell, is turning out about 2,500,000 lbs. of copper per month, while about 750,000 lbs. of Old Dominion copper is being made at International smelter making a total production of nearly 3,500,000 lbs. per month. The writer is indebted to D. G. Beckett, general manager of Old Dominion Copper Co. for data used herein and for other courtesies.

Production of Gold and Silver in the United States.

The Bureau of the Mint and the Geological Survey have issued the following joint statement as to their final figures on the production of gold and silver in the United States during the calendar year 1915:

	Gold		Silver	
	Fine ozs.	Value.	Fine ozs.	*Value.
Alabama	247	\$ 5,100
Alaska	808,346	16,710,000	1,054,634	\$ 526,100
Arizona	220,392	4,555,900	5,665,672	2,826,500
California	1,090,731	22,547,400	1,689,924	843,100
Colorado	1,089,928	22,530,800	7,199,745	3,591,900
Georgia	1,684	34,800	141	100
Idaho	56,628	1,170,600	13,042,466	6,506,800
Illinois	3,892	1,900
Michigan	581,874	290,300
Montana	240,825	4,978,300	14,423,173	7,195,600
Missouri	55,534	27,700
Nevada	574,874	11,883,700	14,453,085	7,210,500
New Mexico	70,632	1,460,100	2,337,064	1,165,900
North Carolina	8,258	170,700	1,496	700
Oregon	90,321	1,867,100	125,499	62,600
Philippine Islands	63,898	1,320,900	15,148	7,600
Porto Rico	34	700
South Carolina	174	3,600
South Dakota	358,145	7,403,500	197,569	98,600
Tennessee	329	6,800	99,171	49,500
Texas	87	1,800	724,580	361,500
Utah	189,045	3,907,900	13,073,471	6,552,200
Vermont	150	100
Virginia	24	500
Washington	22,330	461,600	213,877	106,700
Wyoming	672	13,900	2,910	1,400
Total	4,887,604	\$101,035,700	74,961,075	\$37,397,300

*At the average price of silver per fine ounce for the calendar year 1915, \$0.49889.

These figures compare with the production of 1914 —\$94,531,800 in gold, and 72,455,100 fine ounces of silver, being a gain in the gold production of \$6,503,900 and 2,505,975 fine ounces in the silver product.

Tin exports from the Federated Malay States for May were 3722 tons against 3823 tons in May, 1915, and 4135 tons in May, 1914. The total exports for the first five months of 1916 were 18,224 tons, as compared with 19,270 tons and 20,599 tons to June 1, 1915, and 1914 respectively.

List of Sketches of Safety Devices.

By EDWIN HIGGINS.*

There is submitted below a list of drawings of safety and efficiency devices, which may be secured free of cost by California mine operators. In asking for any of the drawings, they may be referred to by number:

- 1—Arm and Leg Splints.
- 2—Electric Pull Switch for Mine Bell Signal.
- 3—Safety Hook for Bucket.
- 4—Continuous Ringing Bell for Motors.
- 5—Safety Elevator Gate.
- 6—Automatic Switch to Operate Colored Signal Lights.
- 7—Details of Safety Clutch for Cage.
- 8—Detail Sketch of Safety Catch for Cage.
- 9—Safety Catch for Cage.
- 10—Miscellaneous Parts of Cage.
- 11—Shaft Cover for Sinking.
- 12—Safety Crosshead for Bucket.
- 13—Iron Drill Rack.
- 14—Lock Hook for Bucket.
- 15—Grid Iron for Protection at Collar of Ore Chute.
- 16—Iron Door.
- 17—Alarm Bell for Cage.
- 18—Standard Shaft Gate (Swing).
- 19—Safety Crosshead.
- 20—Removable Bonnet for Skip.
- 21—Cover for Skip.
- 22—Underground Dry Closet.
- 23—Guard for Underground Trolley Wires.
- 24—Shaft Gate.
- 25—Metal Stretcher.
- 26—Semiautomatic Gate for Mine Shafts.
- 27—Underground Stretcher—Homestake.
- 28—Belt Shifter on Lathe.
- 29—Sheet Iron Covers for Locking Boiler Valves.
- 30—Water Gauge Glass Guards.
- 31—Gate for Shaft Collar.
- 32—Protective Railings for Boilers.
- 33—Grinding-wheel Guard.
- 34—Emery Wheel Eye Shield.
- 35—Cage Safety Catch Testing Device.
- 36—Safety Cage for Ladders.
- 37—Tipple for Dumping Mine Cars.
- 38—Stretcher Drill Diagram.
- 39—Cabinet and Rack for Mine Rescue Apparatus.
- 40—Change House.
- 41—Guard for Rip Saw.
- 42—Riley Two Deck Cage.
- 43—Automatic Side Dump Car.
 - (a) Standard Incline Trip.
 - (b) Draw Bar.
 - (c) Lower Hinge of Dumping Mechanism.
 - (d) Door Catch Angles.
 - (e) Side View, Dump Car.
 - (f) Details.
 - (g) Details.
 - (h) Details.
 - (i) Details.
 - (j) Details.
- 44—Underground Dry Closet.
- 45—Guard for Tram Car.
- 46—Underground Latrine.
- 47—Door for Cage.
- 48—Safety Crosshead.
- 49—Shaft Gate.
- 50—Trolley Support Methods.
- 51—Underground Toilet Car.
- 52—Sanitary Dry Closet.
- 53—Candle Holder for Miners.
- 54—Toboggan Stretcher for Underground Use.
- 55—Circular Removable Bonnet for Skips.

In addition to the drawings listed above, there are set forth below the titles of a limited number of clippings that are on hand. These are made up chiefly of sketches and descriptive text. They will be mailed on request, free of cost, as long as they last:

- Air Compressor Cooling with Water Barrels (Illus.).
- Aurora's (Nev.) Change House (Illustrated, with cost estimate).
- Drifting with a Stoper (Illus.).
- Improved Safety Door for Dumps (Illus.).
- Bucket-Dumping Device (Illus.).
- Regarding Primers and Misfires.
- Device to Aid in Fuse Spitting (Illus.).
- Proper Way to Spit Fuses (Illus.).
- Bag for Carrying Dynamite (Illus.).
- A Simple Dynamite Thawer (Illus.).
- Burning Empty Dynamite Cases.
- A Fire-Bucket Float (Illus.).
- Coupling Hook for Mine Motors (Illus.).
- Finger Guard on Tram Car (Illus.).
- Safety Hand Grip for Mine Car (Illus.).
- Automatic Landing Chairs (Illus.).
- Spillage and Sinking Pocket (Illus.).
- Crossheads for Bucket Hoisting (Illus.).
- Runaway Tubs or Hutches (Illus.). A safety hook for shafts of slight inclination.
- How to Splice Wire Rope (Illus.).
- Miners' Dwellings (Illus.).
- Concrete-block Mine Houses (Short).
- A Simple Chain Ladder (Short).
- Wood versus Steel Mine Ladders (Illus.).
- Capital Mine Steel Ladders (Illus.).
- A Simple, Strong Chute (Illus.).
- A Substantial Ore Chute (Illus.).
- Types of Chutes and Chute Gates (Illus.).
- Removable Chute Spray (Illus.).
- Drinking Fountain for a Mine (Illus.).
- Water Disinfecting Outfit for Field Use (Illus.).
- Septic Tank for Underground Latrine (Illus.).
- Four-deck Shaft-repair Cage (Illus.).
- Cover for Shaft Ladderway (Illus.).
- Simple Folding Shaft Gate (Illus.).
- Hinge for Shaft Doors (Illus.).
- Shaft Timbering and Headgear on the Mesabi Range (Illus.).
- Light Shaft Timbering (Illus.).
- Locked Signal System (Illus.).
- Bell-wire Arrangement in Sinking (Illus.).
- Gravity Release Electric Signal Box (Illus.).
- Warning Bell for Topman (Illus.).
- Raising a Gin Pole (Illus.).
- Straightening a Tall Leaning Chimney (Illus.).
- Safety Staging Hook (Illus.).
- Methods of Stope Timbering (Illus.).
- Emergency Pipe Wrench (Illus.).
- Timbering for Air-check Doors in Motor-haulage Drift (Illus.).
- Ventilating a Long Drift.
- Water-tank Indicating Gauge (Illus.).

Money losses through poor freight classifications often take place; for instance, drill machines take different rates. One mining company placed an order for two drill machines, price to be f. o. b. mine. Later in the same month the drill machine agent came around and took an order for another two machines same kind, weight, etc. The four came in the same month, but were classified differently. There was quite a difference in the freight rate; in one case the shippers saw to it that the cheapest freight rate was obtained as the machines were bought f. o. b. mine. In the other they had an order for machines from their traveling salesman, nothing being said as to freight rate or point of delivery.

*State Mine Inspector for California.

Relations Between Custom Smelters and Small Mine Owners

By J. M. TURNBULL, M. E.*

The average prospector, small mine owner or manager, and others interested in mining on a small scale, have usually very vague ideas in regard to the operations of a smelter. Their ideas in regard to the values of ore are, as a rule, based on the gross values. If the gross value of the ore, figured on full assay at market prices of metals, is, say \$20, and the smelter treatment rates is say \$5, one would at first sight expect to get a net of \$15, and when, instead, one gets \$8 or \$10, it is natural to feel that there is something wrong, and that all the deductions made by the smelter, which account for the difference, cover a large hidden profit for the smelter—in fact that one has practically been robbed. If, however, one was familiar with how these deductions were arrived at, and had an idea as to what deductions were reasonable and justified, and what ones not, he would be in a better position to see what kind of a deal he was getting, and judge its fairness for himself.

Smelters and the Public.

In answer first to the broad question: Do present day smelters of custom ores make exorbitant charges, or rob the miner? I have no hesitation whatever in answering "No" to this question in general. In the great majority of cases where charges seem excessive there is a good reason back of them. This is partly due to competition, and partly, in common with other large business, due to the fact that in the long run it pays to be reasonably honest. In exceptional cases exorbitant charges may be obtained, but eventually they discourage production, on which the life of the smelter depends, and the modern policy is to encourage the producer with fair rates, and so build up a permanent business, in return for the large capital investment required. While not usually guilty of robbery and extortion, smelters are in business to make a profit, and endeavor to buy and sell to best advantage. The small miner can hardly expect as good rates as the large steady producer, but by knowing something about the business he can often market his ore to better advantage, and get the best contract possible.

Smelter Profits.

The American Smelting & Refining Co., in 1915, did a volume of business amounting to \$225,000,000, on which their net profit was some \$13,000,000, or 5% on the turnover. Of this, however, nearly \$4,000,000 was put back in the form of new construction for 1916. 1915 was a good year, and the profits do not

look very great compared with some of the "War Baby" stocks. The profits were very good, much better than many former years, but hardly look like extortion or robbery.

On a tonnage of over 4,000,000 tons the average net profit was about \$2.25 per ton. In British Columbia our smelters are largely engaged in smelting ores from their own mines, and their total profits are from both mines and smelter, and the smelting profits are not separately given in annual reports. In the case of the Trail smelter, which smelts the largest tonnage of custom ores in British Columbia this tonnage is from 12 to 15% of their total only. I happen to know positively, from my past connection with this smelter that their rates are not extortionate on custom ores.

Having given the smelters a fairly good character, I will now take up certain points in connection with their operations and charges in detail.

Settlements in General.

Theoretically a smelter operates on the idea that he takes your ore, extracts the pure metals from it, and hands them back to you, charging you a fair price for the work of doing so. In practice this is found to be impossible however. Each lot of ore cannot be smelted separately, and its contents kept separate. For economical smelting an average constant mixture must be maintained, so that before the ore ever sees the furnace it is mixed up with other ores, and since ores are received irregularly, some are smelted quickly and others may be delayed some time, in order to keep the furnace mixture reasonably constant. A dozen different ores may be in the furnace at once and the metal produced is merely an average. The average losses can be determined, but no one can tell what the exact loss is on any particular one of them. What the smelter does is to put each lot separately through the sampling mill and assay the sample, determining the metal contents by this assay. The losses can only be assumed in each case from the average loss on all the ores smelted together.

A smelter test on any lot of ore consists of an accurate sampling and assay. There can be no real smelter test on one lot. To ship a carload for a smelter test means therefore that you get an accurate sample, and the smelting quality of the ore is largely judged from the analysis made in the laboratory, long before the ore gets near the furnace. Since metal is produced by the smelter in one lot from many lots of ore, it is practically impossible to separate it into proportionate small lots and hand each mine back its proportion, nor could it be sold in this way to ad-

*Professor of Mining Engineering at University of British Columbia; excerpts from an address delivered before Vancouver Chamber of Mines.

vantage, since metal selling is a complicated business, based on large contracts, etc., so that the smelter is compelled to act as selling agent. Selling costs money; therefore the smelter always deducts a market charge from your ore in some form or other.

Extracting the metal from your ore and selling it takes on the average about 3 months; therefore, unless you wish to wait 3 months for your returns on ore, the smelter is compelled to act as banker, and advance you the money on the basis of the ore assay. This means interest charges which are also deducted from you in some form. The price of metals may vary greatly in 3 months, however, so that if the smelter pays you on the basis of the price at the time he receives the ore, he may make a profit or loss on the sale of metal 3 months later, according as the price goes up or down in the meantime.

This method of payment is known as "spot" settlement. It is not usually desired by the smelter, since a slump usually occurs when metal prices are high, when everybody is shipping all he can and the smelter is overstocked with ores, so that the tendency is for the smelter to make a larger loss on the slump than gain on the rising market. To place the risk of gain or loss on the mines, the smelter may make contracts on a 3 months' settlement, that is pay 90% spot and adjust the balance on the price of metals 3 months after receipt, paying you in fact as near as possible on the basis of what they actually receive for the metal.

Treatment Charge.

In quoting you a treatment rate, the smelter makes various deductions, which are supposed to cover marketing costs, losses in smelting and so on. Presumably these are the costs and losses actually incurred by the smelter in operation, acting as your agent, and do not theoretically leave any profit for the smelter, that is from the deductions alone. In addition a straight treatment charge is made, which presumably covers actual cost of smelting plus profit. If the smelter makes an unusually low treatment charge, it probably makes up the difference by high deductions and vice versa. A low treatment charge does not necessarily mean that you are getting your ore smelted cheaply.

In the meantime, what is a fair treatment charge? This depends on the ore, and can only be answered very generally. On copper ores, with immense tonnages of easily smelted ore, the direct cost of smelting may be as low as \$1.25 per ton, as at Grand Forks. With high-grade concentrates it may run up to \$4 or even more. On the general run of ordinary ores somewhere about \$3 would not be excessive. Adding one or two dollars for profit a charge of \$4 or \$5 is reasonable in most cases, provided an extra profit is not also made on excessive deductions.

On lead ores which require roasting, as most British Columbia ores do, the direct costs of smelting, not including refining, may run as high as \$8 or even more but are even more difficult to average up than

copper, depending on the grade of the ore, and treatment charge is often on a sliding scale varying from \$8 to \$12 in general, which, including profit, is not usually excessive if deductions are fair.

Moisture.

Ores are received at the smelter in railway cars, etc., are first weighed, giving the gross weight, then in turn go through the sampling mill being crushed, run over samplers, etc., in the course of which they dry out to some extent. The sample is taken, part of which is weighed and dried in an oven, and the per cent of moisture determined. From this and the gross weight the dry weight is calculated, the assay is made on the dried sample and payment is made on the dry weight, which is fair and accurate. In the sampling and handling, however, the ore dries out somewhat and there is often a considerable dust loss. To cover these losses the smelter sometimes makes a deduction of about $\frac{1}{2}$ of 1%, which is called yard loss. The loss is real, but just what it really amounts to is hard to determine, impossible in fact. One must judge its fairness by circumstances. It is, however, not a dishonest deduction in principle—it is a question of amount.

Marketing Charges.

What is a fair marketing charge? This is rather a knotty question to answer. Let us see what marketing charges consist of. Refining either lead or copper is usually considered as part of the marketing. Copper refining probably costs about $\frac{1}{2}$ ct. per pound in the east, and somewhat higher in the west, depending on labor and electric power costs largely, as well as scale of operations, say not over $\frac{3}{4}$ ct. Freights from the west to New York would account for another $\frac{1}{2}$ to $\frac{3}{4}$ ct. Three months' interest brokerage and commissions bring the total up to about $1\frac{1}{2}$ to $1\frac{3}{4}$ cts. for the great big fellows, while the smaller smelter might be out 3 cts. or even more. On custom ores the deduction is usually from 3 to 4 cts. per pound. In general the smelter probably plays safe on this and makes from $\frac{1}{2}$ to 1 ct. per pound equivalent to from 30 to 60 cts. per ton on 3% ore. A high deduction on this account is all right if the treatment charge is low by a corresponding amount.

In case of lead, refining is less costly being a minimum of 0.2 ct. per pound under most favorable conditions of cheap fuel and labor. In the west it might run up to 0.5 ct. Freight from the west would be to the east, where the chief market is, another 0.5 or 0.6 ct. besides selling expenses. The Trail, B. C., smelter deducts 1 ct. per pound for marketing, on which they evidently make no profit. American smelters usually deduct $1\frac{1}{4}$ to $1\frac{1}{2}$ cts., and can make apparently low treatment charges on ore in consequence. There is a mutual tariff wall between Canada and the United States on lead, hence marketing conditions are somewhat artificial, whereas in copper there is free interchange. Lead ores as shipped usually contain

from 25% to 70% lead, whereas copper ores run from 1% or 2% up to not over 10% or 15% as a rule, hence the marketing charge on lead usually figures out much higher per ton of ore, even though less per pound of metal.

Metal Deductions.

Smelters usually make deductions from the metal assay to cover losses in smelting. In the case of copper, losses are chiefly in the slag, and partly mechanical, flue dust handling, etc. Slag in the furnace seems to hold a certain minimum amount of copper varying to some extent with the grade of the ore. Considering all the operations which time prevents my considering in detail, the loss seldom runs very much below 0.3%, and may be considerably more on high grade ores. We may take 0.3% as a fair average deduction on which the smelter is not making much if any profit. Except on high grade ores, 20% to 30% copper or more, any deduction over about 0.3%, represents a profit for the smelter. In many cases it will be found that the smelter is making a deduction of 1 to 1.3% usually with a low treatment charge to correspond.

Lead deductions are on quite a different basis, chiefly because lead and lead compounds, unlike copper, are volatile at furnace and roasting heats. Lead smelters make various rates. The Trail smelter pays 90% of the lead; that is it deducts 10% for losses, which losses mostly occur in smoke. Certain United States smelters smelt Mexican lead ores in bond and are required to export the equivalent amount of lead metal. The U. S. Government therefore checks them up, and makes an allowance for losses in smelting and refining. In 1914 these were as follows: Balbach, New Jersey, 8.52%; Perth Amboy, N. J., 22.32%; El Paso, Texas, 18.56%. This is pretty good evidence. In the case of Trail, I know that the losses are away over 10%, that is why they are spending so much money on Cottrell smoke plants to reduce the loss.

As a matter of fact the losses depend on the ores; they are much less on very pure ores. In Missouri they may be less than 5%, but on impure zinc ores such as we have in Canada, in the west, 10% is a fair deduction, more than fair in fact.

On silver and gold the deduction is usually 5%, at which figure there is little profit or loss for the smelter on the average, so that we need not go further into it.

Penalties and Bonuses.

Lead furnace slags can carry about 6 or 7% zinc without much detriment. Above this point the zinc has two bad effects, first it tends to carry silver into the slag, and second it tends to make the slag infusible and pasty, which results in slow furnace running, greater slag losses, and difficulties in running, which add materially to the costs and troubles, of which there are plenty in lead smelting in any case, and cuts down capacity. This rapidly gets worse as the zinc gets higher. With over 12 to 15% zinc it becomes next to impossible to run the furnace at all. A smelter

which gets low zinc ores on the average can stand a few lots of high zinc without much detriment, and should not charge a high zinc penalty. Where the high zinc are a serious matter and necessitate a high high zinc area serious matter and necessitate a high penalty, even with which they are not desired very much. The usual penalty is 25 to 50 cts. per unit (1%) on all zinc over 8% to 10%. The miner should of course take the difference in zinc penalty into account in comparing rates.

Silica Iron and Lime.

In order to run a furnace properly the smelter must keep an even balance between silica on the one hand and iron and lime on the other. If he cannot get this balance in the available ores, he is compelled to make the balance with barren fluxes, such as quartz iron ores (free from sulphur if possible to obtain) or limestone. Few smelters can get an even balance, or self-fluxing mixtures, from ores only, and have to offer special inducements in order to attract the kind of ore they need, and make it possible to ship low grade ores of the needed class, by offering a bonus on the kind of material they need. They usually at the same time charge a penalty on ores of opposite character.

The proper method is to have the penalty and bonus equal and opposite, usually 5 to 10 cts. per unit, payable or chargeable on the excess of one side over the other, that is silica excess over iron plus lime or vice versa.

United States Dredges in Malaysia.

Dredging operations in the Federated Malay States and Siam have for the past few years assumed considerable importance. Recovery of tin is the principal object sought. Practically all of the operators are English companies, and chief among these is one known as Malayan Tin Dredging, Ltd., which has approximately 1200 acres of tin-bearing lands in the Kinta valley at Batu Gajah station, Perak. The property has been drilled throughout at close intervals and four special Lobnitz bucket dredges are now in operation, with another to be put in service in the near future. It is estimated by the company that one of these machines will clean up 8 to 10 acres per year. A number of dredges of American build were constructed during the year for companies operating in the peninsula. These include one 7-cu. ft. Bucyrus dredge with steel hull, for a company known at Tin Bentong, which will be installed at Kuala Lumpur, and one 5½-cu. ft. Bucyrus dredge, also with steel hull, for the Tin Mines of Siam, Ltd., a subsidiary of the East Asiatic Co. of London. This dredge will be used in the Pong district of Siam.

The impurities in many copper ores impair the accuracy of the electrolytic assay, and the tedious operations for their complete removal tend to cause loss.

The Chisana-White River District, Alaska.

The discovery of gold in stream gravels on several of the headwater tributaries of Chisana river led to a stampede of prospectors into this district in 1913 that recalled to old-timers the early days of placer mining in the territory. This district is described by Stephen R. Capps in Geological Survey Bulletin 630.

Upper White River valley was first brought to the attention of mining people by the discovery of native copper on Kletsan creek, and it was not until gold was found on Bonanza creek, in 1913, that the district began to be thought of as a source of gold rather than copper, though gold quartz veins had been staked in this very locality at least 6 years before 1913. When, late in the summer, the men who found the gold on Bonanza creek returned to Dawson for supplies their discovery leaked out, and several thousand gold seekers rushed into the country, many of them without equipment or provisions and unaccustomed to the rigors of an Alaskan winter. The small supplies of food then in the region were soon exhausted, prices rose to prohibitive figures, and sufficient provisions were not available even for those who could afford to buy them. Fortunately, the district was well supplied with game, so that for weeks many lived on a diet of rabbits and ptarmigan. In 1914 most of those who had been disappointed in staking valuable claims or disgusted with their experiences left the district, and the real business of mining began.

The rocks of the Chisana-White district are of many types. The high mountains of the Wrangell and St. Elias ranges, on the west and south, are composed dominantly of igneous rocks, but the Nutzotin range, in which the gold-bearing gravels were found, is composed primarily of sedimentary beds, which are cut by dikes and intruded by large masses of crystalline igneous rocks, and contain also some surface lava flows.

The whole area is strongly glaciated. During the last retreat of the glaciers the melting ice left morainal material throughout the district. Large deposits of outwash gravels were laid down and are still accumulating in the valleys of the glacier-fed streams. Talus, peat, muck and some volcanic ash, as well as normal stream deposits, making up the post-glacial materials in the areas that are not now receiving glacial and glacio-fluvial deposits.

The productive gold placer gravels of the Chisana district are found within a small area, nearly all the gravels that have been profitably mined lying within a circle 5 miles in diameter. Bonanza, Little Eldorado, and Skookum creeks have produced most of the gold mined. The short mining season, comprising only 90 to 100 days, and the remoteness of the district from lines of transportation combine to make mining expensive. Gold has been mined actively, however, and the total production of the district up to and in-

cluding the year 1914, was probably not far short of \$300,000.

New Mexico Metal Production in 1915.

The output of New Mexico mines in 1915, as reported by the Geological Survey, had a value of more than \$19,000,000. Detailed production was \$1,461,005 in gold, 2,005,531 ozs. of silver, 76,788,366 lbs. of copper, 4,542,361 lbs. of lead and 25,404,064 lbs. of zinc (in terms of spelter and zinc in zinc oxide). These figures show an increase of \$289,309 in gold, 228,086 ozs. of silver, 17,480,441 lbs. of copper, 2,778,720 lbs. of lead and 7,000,672 lbs. of zinc. The value of the metals, except silver, was higher than in 1914, the total being \$19,279,368, against \$11,049,932 in 1914, an increase of \$8,229,436.

Copper has always been a valuable metal in production of New Mexico mines. In 1915 the yield of 76,788,366 lbs. of copper represented a value of \$13,437,964 of total state output of all metals, which was valued at \$19,279,468. Since 1910 the increased production of copper has been due principally to activity of the Chino Copper Co., which mines with steam shovels a large area of low-grade copper deposits at Santa Rita and mills the ore at Hurley in a wet-concentration-flotation plant of five sections. In 1915 this plant treated an average of 6520 tons of ore a day, total output having been 2,379,800 tons, the largest quantity treated in any one year by this plant since it began operations. Average content of the ore treated was 2.155% copper. Total production of concentrates was 158,444 tons, corresponding to a ratio of concentration of 15.02 tons of ore to produce one ton of concentrates. Total quantity of copper contained in concentrates was 68,293,893 lbs., corresponding to an average concentrate grade of 21.551% in copper and a recovery of 28.697 lbs. of copper per ton of ore represented an extraction of 66.588% of copper content. The net cost of copper produced in 1915 was 7.12 cts. per pound, compared with 7.6 cts. per pound in 1914. Net operating profit amounted to \$6,688,729. Dividends paid during the year 1915 amounted to \$2,609,860, and surplus earnings were \$4,304,124. The total dividends up to and including 1915 aggregated \$6,697,995.

A considerably increased yield of copper was made by the matting plant of Santa Fe Gold & Copper Co. at San Pedro, Santa Fe county, which was operated only 1 month in 1914, as against 8 months in 1915.

Low's iodide method is one of the most accurate, practical methods yet devised for the assay of copper, although the more simple cyanide assay is also excellent if properly carried out.

Ammonia, as ammonium sulphate, is produced cheaply as a by-product in the manufacture of coke in by-product ovens.

Mining Possibilities in Colombia, S. A.—IV

By MATT. W. ALDERSON.

The person who thinks of doing business in South America must familiarize himself with conditions and govern himself accordingly. Herein we have failed in the past and most of the trade of this splendid part of the world goes to foreign countries. Colombia has about one-sixth as much territory as the United States, with but one-twentieth of the population. It has no railways of any consequence in comparison with ours. In the entire republic there are less than 700 miles of railway and these are on 13 different lines, the shortest 8, and the longest 92 miles. In the mining sections all transportation is over trails: The Royal Highway is a mule trail, and the trails would be considered im-

grades; they go up ridges to the summit of a range, thence along on the top and down when necessary to a lower level. Oftentimes they are steeper than the ordinary roof of a house. They are supposed to be self-draining, but this doesn't always work out in actual practice. Where the ridge is of clay and water and gets to running down in the trail, it at times cuts out a veritable canyon, and when it gets so deep it cannot be traveled, a new trail will be made along the edge.

In Colombia the soil is not cultivated and if the government were to depend on what it could get out of persons living a real country life, it wouldn't be able to maintain itself a day. The average country

AT FOOT OF HYDRAULIC ELEVATOR, SEGORIA MINE, COLOMBIA.

passable in almost any other country. Everything transported any distance must be on the back of a pack animal. This means that the average load should not exceed 200 lbs.

One would think that where everything into the interior, away from the navigable rivers, is transported on pack animals, the persons using them would be adepts. But they are not. Pack saddles are practically unknown. A simple pad stuffed with grass is placed across the back, and the load is tied on in anything but a thorough fashion. If it sags down on one side the driver hunches it up, and perhaps loosens the rope a bit, and tightens it up again. As a result, it is practically impossible to find a pack animal in good condition.

The trails do not go along valleys or on easy

home is well built, but as a general rule it wouldn't be of value to anyone but the owner. There is no other improvement on the land, and all that could be gathered up on the homestead wouldn't sell for as much as \$2. The politicians, as with us, figure they must get revenue out of the dear people in some way, and they put a heavy tax on imports. Goods are taxed when they come into the country, are sometimes subject to a second tax from the Department (corresponding with our State), a third tax from a district and a fourth from the city of their destination. The import taxes are not on the net weights of a package, but on the gross. As a result, some American goods sell in Colombia at four or five times the retail price in the United States. The result is considerable criticism, but in reality the political life and ways in

MONITOR IN OPERATION AT HYDRAULIC ELEVATOR IN COLOMBIA ON RIO GRANDE.

Colombia are not so rank as with us. The people there are simply more honest and do not cover things with pretense, as we do.

Goods shipped into the interior of the country must not only be in packages of limited size and weight, but they must be securely packed. I have stood on the deck of an ocean steamer and seen packages marked "fragile" all over them in big letters, loaded in a swing with about 2000 lbs. of hardware and dumped into

the hold of the boat. What do big signs on a package means to a man who can't read English, or who doesn't care if he can?

All kinds of stories are told of Americans who do fool things in making shipments to this country. It appears there are too many of us who think we know more than the person who places the order. For instance: One man ordered a shipment of fountain pens. He was specific in his order to ask that the pens

HYDRAULIC ELEVATOR AT SEGORIA MINE, COLOMBIA.

be taken out of the holders and shipped in a separate package. The person who filled the order wasn't going to do any such fool thing as that. He shipped the same as he would anywhere else. His customer had to pay duty on the penholders and the enclosing box as if the entire weight were solid gold. If he has any sense will he not place his next order somewhere else?

The person who expects to do business in South America must speak the Spanish language. He may think he can hire an interpreter, but if so he will lean on a frail reed. He will be practically in the same position as a Spaniard would be coming among us. How many could he find that could be of help to him? One man seeking a job from me said: "I spit Inglese." I didn't hire him. I let him spit at somebody else. A man hired for me was little better. He was not familiar with mining terms in either Spanish or English and so was practically worthless. Most who can talk fairly well—and they are very few and far between—become so interested in the questions you ask and the information elicited, that they fail to pass on to you what you are seeking to find out. Sometimes these men will elaborate on your statements, perhaps with the intention of having what you say put into more pleasant words, but I have noticed that persons who elaborate are not generally reliable, and are certainly not to be trusted to give specific, definite information or instruction.

If I were to put the question to people I know as to the character of the working class in Colombia, I would receive different answers. I presume those answers would vary in proportion to the experiences of those persons and the sections they have been in. Possibly in the mountainous part of the country where there seems to be more white and Indian in the blood than in the lowlands, where there is more of the Negro, the people are more energetic and enterprising. My observations of persons in the mining section is that for politeness, frankness, unselfishness, kindness of disposition and a general spirit of contentment, they throw the residents of the United States away in the shade. I was not prepared for this. I had had experience in the early seventies with some residents of Mexico and had found them cruel, treacherous and unreliable. Part of the difference is no doubt explained in the fact that the Indian blood in these people is that of the famed Incas, a people the very reverse in character to the savages of our own country and Mexico.

There are no newspapers outside of the large cities, and a place of several thousand inhabitants will receive less mail in a week than a country place of 50 persons would receive in a day in the United States. News goes by word of mouth and what one person knows the entire community knows.

I have had persons with me on trips offer to climb a mountain and bring down samples for me. I didn't let them do it, but if I had I am sure it would have been what they claimed it to be. In talking of certain properties I have asked men if the property they owned was as good as such an one, and without hesitation they

would say the property of the other man was the richer and better, when that was the case.

In examining one property I wished a certain part of an old level reopened. The owner of the property was not in affluent circumstances and I thought possibly he might like to do the work. He said he would but he would need a man to help him. Asked as to compensation, he said his helper would have to have \$1 a day and I could pay him 80 cts. I thought there must be some mistake but he explained that he was not a practical quartz miner himself and would need such a helper. Can you imagine such a proposition from a mine owner in the United States?

I would not think it wise to trust extensively in such a country as Colombia for the business man would have an impossible task collecting in what was due him in times of stress, but there are occasional business men who stand out with an exceptional record

WOOD CARRIERS SUPPLYING CAMP.

for probity and business ability. I give an illustration: A prominent mining company has as its agent one of the business men of a nearby town. Every Saturday night he is furnished with the pay-roll and he is supposed to pay the men. The company gets no receipt from any one of the men paid; has no means of knowing, in fact, that any single one of the men has received the money due him, and yet in 6 years it has not had a single man say he has not received his money. This way of doing business would seem to those accustomed to our way of doing things lax to the point of danger, but it works out in actual practice.

A clean-up of thousands of dollars is sent by one man for 100 miles or more and he brings back the cash with no thought that he will be interfered with in any way. These people trust each other as we would never think of trusting in the United States, and their confidence seems never misplaced. Some of them live in houses having nothing but a roof. There is nothing of what we call exclusiveness.

The working people in Colombia live a simple life.

They are not provident, they have no idea what frugality means. They have no accumulations, nothing of value. They wear clothes so patched with pieces of different colors as to throw a premium crazy quilt in the shade. They sleep with about all they have on their persons. In bunk houses the bed is no more nor less than a shelf on the wall. If the section is where the sleeper may feel chilly along towards morning, he doesn't provide himself with covering of any kind; he boards up the space between his shelf and the one above, excluding all the air he can. They dress up and go to the village to attend mass and make purchases of food on Sundays, and men working for me always came to their work dressed in clean clothes every Monday morning. Some of them would "deelight" our Teddy. One of the men who worked for me, the first part of whose name was John of the Cross, had been married 14 years and had a child to show for each year. My man Jesus was father to 13, and my man Joseph and Mary had 10 to provide for.

Wages for day laborers are from 70 cts. up. Good quartz miners sometimes command \$1 a day, but the average pay-roll in any other kind of work will be less than this. One may well be surprised that good workmen can be obtained at such prices, especially when necessary food supplies are high. Following are ruling prices per 100 lbs. for some of the staples: Flour, \$13; corn, \$4.50; beans, \$16; rice, \$9; potatoes, \$4; sugar, \$13; unrefined brown sugar, \$4. Persons have asked me how people live who get such low wages and have to pay such prices. The question is not how people live who get these wages, but how do those persons live who do not get them.

Capital in South America is scarce and commands a high premium. One lady I could name has \$10,000 in one of the capital city banks of Colombia on which she is paid 1% a month by the year. Banks lend money at 1½ to 2% a month. A village of 4000 inhabitants borrowed \$5000 to put in an electric light plant and pays 2% a month for the money. The Republic tries to own its own railroads, and was 40 years building 120 miles. There is a gap of a few miles between the two sections that it may take another 40 years to finish, though the work progresses steadily, 150 men being employed, as an experienced railroad man puts it, "taking out dirt with teaspoons for shovels."

The man from the United States is expected to leak money every step he takes. He is everywhere recognized as a rich man. How can he be otherwise than rich? Has he not come from a far-away land? Has it not cost much money to make the trip? The ordinary individual knows that even if he could get continuous employment at his home in South America at the best wages obtainable it would take an ordinary lifetime for him to save up enough to make a trip to the United States and back. How rich and how much more fortunate, then, must be his brother of the north?

In ports and some other places one must be on guard against paying two or more prices for things. A superintendent visiting a large city for the first time was advised to be sure to ask for the discount. When he went to pay for his purchases he would say:

"There's a discount on this bill, isn't there?" "Yes, 16%." The American will always pay more than he should if he doesn't "know the ropes."

One who has made his home for some time in a section of Colombia where the laboring class predominates will miss something in the women of the United States on his return. They will not look natural without cigars in their mouths, a prayer book in their hands, or a bundle on their heads. In our country smoking is considered an elegant and graceful accomplishment for men, and most of them consider a cigar as essential to their good appearance and entry into the best society. For some reason we have not reached the logical conclusion that what is elegant and worthy of acceptance by our men should also be essential to the appearance and comfort of our women and children. The South Americans who live away from the big cities have. Every one—men, women and children—smokes; not pipes, but cigars made of real tobacco not lacking in any of the elements of strength and stench desired and approved by the most fastidious smokers. Every one in our country shows in his attitude when smoking that he is doing something of great importance. The women and children in South America exhibit this same great pride in accomplishment.

The South American, as is the case with his North American prototype, will let the most important business wait while he lights his cigar. I have known a Colombian postmaster to give his North American guest a cigar and stop to light it for him when 50 persons were in front of the railing waiting for their mail. Persons familiar with life in Colombia would naturally think that food and clothing were the most vital necessities of the common people, but they are not. The average person, man, woman or child, may get along with very little of either—many, in fact, do not have a single unpatched garment—but he cannot get along without his cigar.

These observations must not be taken to apply to all the people of South America. In the large cities may be found many persons who are as refined and free from bad habits as persons in the best communities of same size in the United States. The foreigner doing business in Colombia who has ample funds and who is disposed to be fair in his dealings, may be sure of square treatment in every way. And the courtesy of the people is charming. I have had a business man close his store to take me to a person I wished to see. I have asked directions and have had a boy sent to show me, or the man himself has left his work to go with me into a part of the city or country with which I was not familiar. Some of the customs of the country are different from what we have been accustomed to, and may provoke a smile, as some of ours might cause these people to smile. But is it not everything if one must do business with persons to find them obliging, industrious and honest? Such are the people in Colombia. They need capital for the development of their country, and the man who risks it there will receive all the appreciation he deserves and all the aid towards getting remuneration that he should expect.

Chemistry and Metallurgy of Tungsten

By M. L. HARTMAN.*

The directions for making the qualitative reduction test are as follows: Boil at least 0.2 gram of finely divided material in a small test tube with concentrated hydrochloric acid until about one-half of the acid is evaporated. Dilute with an equal volume of water, add a piece of metallic tin, and heat if necessary. A fine blue color in the solution, or a blue residue, indicates the presence of tungsten. If this test gives negative results, about 0.5 gram of the material should be fused in at least four grams of sodium carbonate. (This may be done with an ordinary Bunsen burner in a metal crucible or before the blast in a porcelain crucible.) Dissolve the fused mass by boiling water in the crucible. Acidify the aqueous solution with an equal volume of concentrated hydrochloric acid, add a piece of metallic tin, and warm if necessary. The volume of the solution should not be more than 10-20 cc. A fine blue color in the solution or a blue residue indicates the presence of tungsten. In either case, if reduction is continued long enough, a brown color is obtained.

These tests if properly used will show the presence of tungsten in materials as low as 2%, and by using special precautions will detect tungsten in even lower grade materials.

Columbium (niobium) is the only element at all likely to give a blue color under the conditions of this test. This blue can be distinguished from the blue of tungsten oxides by the fact that it disappears when the blue solution is diluted with water. Vanadium also gives a blue color when solutions of its salts are reduced, but tartaric acid will cause this reduction, whereas it will not reduce tungstic oxide. Molybdenum on reduction goes through a series of color changes from violet to blue to black. Titanium gives a violet color. No other elements will ordinarily interfere with the test for tungsten.

The following three methods are the ones in most common use for the quantitative determination of tungsten in ores. The first two are quoted from A. H. Low's "Technical Methods of Ore Analysis." The third is a method preferred by some analysts.

Hydrofluoric Acid Method.—Treat 0.5 gram of very finely powdered ore in a small platinum dish with equal parts of strong HCl and HF acids. Digest on a water bath until solution is complete, adding more of each acid from time to time if necessary. It may require from one to several hours to effect complete decomposition of the ore. Usually a perfect solution may be obtained. Any tin oxide present will be unaffected. Finally, evaporate to about 15 cc. with an excess of HCl. A yellow precipitate of H_2WO_4 may separate during the final evaporation, owing to the

expulsion of the hydrofluoric acid that holds it in solution. This will do no harm, provided it can be removed from the dish. Transfer the solution and any precipitate to a 6-oz. flask, add 20 cc. HCl acid and 8 cc. strong nitric acid. Boil down to about 10 cc. This will expel any remaining HF and precipitate the tungsten as tungstic acid. Dilute with 50 cc. hot water and allow to simmer at a gentle heat for about half an hour or until the tungstic acid has settled clear. Filter, wash with hot water, slightly acidulated with HCl, and then dissolve the tungstic acid on the filter by pouring warm dilute ammonia over it, using as little as possible, and washing the filter with the same solution. Receive the filtrate in a weighed platinum dish. Evaporate the solution on a water bath to dryness, and then ignite the residue at a red heat, cool and weigh as WO_3 . The cold residue should be a bright yellow color. Multiply the weight of the WO_3 by 0.793 to obtain the weight of tungsten, from which the percentage in the ore may be calculated.

Fusion Method for Tungsten Ores.—Fuse 0.5 gram of the very finely ground ore with 2 to 3 grams of sodium-potassium carbonate in a platinum crucible for from one-half to three-quarters of an hour. Dissolve the fused mass in boiling water. The tungsten goes into solution as sodium or potassium tungstate, together with alkali silicate, and also stannate, if tin is present. The residue contains the iron, manganese, calcium and magnesium. Filter and wash with hot water. Rinse the residue into a beaker, and warm with dilute HCl. If gritty particles remain undissolved, filter them off through the filter last used and wash with hot water. Dry and ignite the residue, and again fuse it with the mixed carbonates. Dissolve the fused mass as before, filter and unite the filtrate with the first filtrate.

Having thus obtained an aqueous solution of alkali tungstate, add to it an excess of nitric acid, and evaporate to dryness on a water bath. Again add a little nitric acid and evaporate to dryness a second and third time. Finally heat the residue in a drying oven at $120^\circ C.$ for some time and then moisten with strong nitric acid and allow to stand for 15 or 20 minutes. Now add a hot 5% solution of ammonium nitrate and filter the mixture, washing well with ammonium nitrate solution slightly acid with nitric acid to remove all the sodium and potassium salts. Finally wash once or twice more with a hot, very dilute ammonium nitrate solution and then dry the filter and contents and transfer the latter as completely as possible to a weighed platinum crucible. Moisten the paper with a strong solution of ammonium nitrate, dry it and incinerate over the crucible in a coil of platinum wire. Ignite the whole, now, with free access of air. If the tungstic acid is not pure yellow when cool, moisten

*Professor of Chemistry, South Dakota School of Mines, in Pahasapa Quarterly.

with a few drops of nitric acid and repeat the ignition.

The ignited tungstic acid may contain silica and stannic oxide. The former may be removed by warming with a few cc. HF, evaporating to dryness and igniting. The residue consists of pure tungstic acid or tungstic acid and stannic oxide. The amount of the latter is usually so small as to be negligible. If desired, the tin may be volatilized as stannic chloride by ignition with ammonium chloride. The stannic chloride is decomposed by the moisture of the air and stannic oxide may be deposited on the outside of the crucible. To prevent this, place the crucible in a larger one, and keep the outer crucible covered until the ammonium chloride is completely expelled. Now heat the inner crucible with free access of air until its contents become of a pure yellow color. Cool and weigh. Repeat the ignition with six or eight times as much ammonium chloride as there is precipitate, until the weight of the residue WO_3 becomes constant. The tungstic oxide becomes dark on igniting in the absence of air and only assumes its true color and weight on igniting with free access of air.

The weight of the WO_3 multiplied by 0.793 gives that of the tungsten.

Aqua Regia Method.—One gram of the finely ground ore is treated with about 50 cc. aqua regia in a 4-oz. flask. The solution should be heated but not boiled, and the flask should be frequently shaken. When the solution is evaporated to 10 or 15 cc. it is diluted with 50 cc. hot water and allowed to stand for a half hour. The solution is then decanted through a filter paper, and the residue washed several times by decantation, using about 50 cc. hot water each time. The wash water should be slightly acidulated with hydrochloric acid. Add about 20 cc. ammonium hydroxide solution to the residue in the beaker and when the yellow tungsten acid is dissolved, decant through the filter paper. The ammonium hydroxide solution is best made by adding 200 cc. strong ammonium hydroxide with 1000 cc. water and adding a little hydrochloric acid (about 10 cc.) to form some ammonium chloride. The residue is transferred to the paper by means of this solution, and washed thoroughly. The silica should be white. If it showed signs of incomplete decomposition before transferring to the paper, it should be heated with aqua regia again and treated as before. The ammoniacal solution is evaporated to dryness in a weighed platinum dish, ignited gently to drive off the ammonium salts, and finally heated strongly in the burner flame. Cool, moisten with hydrofluoric acid, and again evaporate to dryness, ignite, and weigh as tungstic oxide.

Accurate methods of analyses and their careful use avail nothing if corresponding care and accuracy is not taken in sampling the material assayed. Errors introduced through careless sampling are in most cases far greater than creep in from the use of inaccurate methods.

Second National Exposition of Chemical Industries.

That the chemical industries are alive to the situation they now occupy in the sum of affairs is evident by the great numbers of firms that have engaged space at the Second National Exposition of Chemical Industries to be held at the Grand Central Palace, New York, during the week of Sept. 25-30, 1916.

The advisory committee of the exposition has been increased and is composed as follows: Chas. H. Herty, chairman, Raymond F. Bacon, L. H. Baekeland, Henry B. Faber, Francis A. J. Fitzgerald, Bernhard C. Hesse, A. D. Little, R. P. Perry, Wm. Cooper Procter, E. F. Roeber, George D. Rosengarten, T. B. Wagner, Utley Wedge, M. C. Whitaker, and Charles F. Roth and Adriaan Nagelvoort, managers.

The managers anticipate an even greater number of visitors to attend this second exposition. The numerous chemical and engineering societies that last year had their attention divided with the attractions of the exposition and the engineering congresses on the Pacific coast, and the first exposition of chemical industries in the east, have this year united and arranged to hold their annual meetings in New York during and in conjunction with the exposition.

The American Chemical Society will hold its annual meeting during the whole week—the program for the meeting is now being arranged and the committees appointed.

The American Electrochemical Society have arranged to hold their meetings the latter part of the week, Sept. 28, 29 and 30, being the dates chosen, and at least one of these days will be devoted to papers that will add greatly to and form a memorable session.

The Technical Association of the American Pulp and Paper Industry is arranging the meeting for this week. This is a young and unusually active institution within the American Paper and Pulp Association and composed of the technical men engaged in the manufacture of paper and its by-products—they consist of chemists, engineers, chemical engineers, plant superintendents and foremen—those who are actually doing the things.

The Bureau of Commercial Economics at Washington is again co-operating with the exposition by arranging a most elaborate program of motion pictures covering subjects dealing with the industries depending on chemistry. Many of these films will have their premier showing at the exposition.

There will be other things innumerable that will prove attractive, entertaining and educational and with all these things and the great interest already aroused for the exposition, it should be a very much greater success than the one last year.

We sometimes learn by telling others what we know. It keeps our minds active and suggests things we would like to find out from others.

Metallurgical Disposal of Flotation Concentrates

By R. J. ANDERSON.*

The flotation process has revolutionized the metallurgy of the base metals, particularly copper, lead and zinc, and from recent commercial practice bodes to extend its application to such an extent so as to replace the cyanide process at least in part, if not in whole, in some places. Oil flotation has had a radical influence on both mill design and on smelting operations, particularly copper practice, and the successful disposal of flotation concentrates is an important phase of the new metallurgy. This disposal involves the problems which deal with the handling of concentrates as produced by the different flotation processes and the subsequent smelting of the concentrates. This, then, gives rise to two divisions of the subject, namely, (1) handling of concentrates and (2) smelting of concentrates.

The Handling of Concentrates.

Froth Breaking.—Flotation concentrates—i. e., the froth entangling the valuable sulphides (and gangue in subordinate amount) plus water—is an unsmeltable product as such. The first step in the disposal operations requires a breaking of the froth, particularly if it be a mechanical froth, such as is produced by the Minerals Separation, Hebbard-Harvey, Janney or similar mechanically agitated machines. The pneumatic froth of Callow or Towne-Flynn is ephemeral and breaks of itself when removed from the influence of the injected air (although, of course, its stability is influenced by the kind of oil used) and is, therefore, more easily handled. The mechanical froth, however, is thick and more or less permanent, and its disposal has presented serious difficulties.

A common practice for froth breaking, which is quite effective, simply calls for the spraying of water on the froth as it flows to its launder. In a number of instances bucket elevators have proved quite efficacious; the splashing and striking of the buckets causes the froth to break up. At the Herculaneum plant of the St. Joseph Lead Co. there have been installed pugmills for this purpose. In addition, these mills insure a steady stream of concentrate feed to the mixing belt, whereby the flotation product is mixed uniformly with the usual feed for the Dwight and Lloyd sintering machines. The method of running the concentrate over tables of the Wilfley or Card type has been tried and is successful in breaking up the froth. Froth may also be effectively broken by the addition of reagents such as acid or lime, or even by adding more oil. In regard to this latter, if an excess of oil is added to a successfully operating flotation unit the froth may be practically "killed." A filter of the pressure type, such as the Kelly, Shriver

or other, will break up the froth in the dewatering operation.

Dewatering.—All flotation processes produce a wet, sloppy, frothy concentrate which is extremely difficult to handle and ship unless dewatered. The skillful and economical disposal of flotation concentrates preparatory to shipment and smelting is, therefore, an important problem. In discussing dewatering practice, certain machines have found their way into the mills and certain methods have been adopted which probably embody the tendencies toward a future standard practice. Some of the apparatus used for dewatering include the following, viz.: settling bins, filters (pressure or vacuum), drag classifiers, screw classifiers and thickeners.

The practice of settling the froth in bins, while a common one, does not reduce the moisture sufficiently low for shipment by rail, unless for short distances. The mill of the Utah Leasing Co. at Newhouse, Utah, has large bins of 200-ton capacity for settling the concentrates. Practically all of the larger plants have come to the use of filters, either of the pressure or vacuum type, or both.

The functional utility of the filter lies in its ability to reduce the moisture content of the material treated to practically any desired percentage. Pressure filters of the Kelly type can take the flotation froth direct and perform the function of froth breaking and dewatering in the same operation. The pressure filter is becoming more bothersome to operate, because it is intermittent in action and requires constant attendance. Although the pressure filter can reduce the moisture content to as low as 6%, the vacuum type finds more favor. The vacuum filter is represented by the so-called Oliver and Portland types. This type of filter is not well adapted to the immediate dewatering of froth concentrates, because such product will not cake well on account of its high percentage of moisture—60 to 70%, and occasionally considerably more. The pulp feed for vacuum filters should have a ratio of 1 to 1. If the froth be first broken and then dewatered in a Dorr tank, the vacuum filter can be used, and it is preferable to the pressure type by reason of its continuous operation and low operating cost. The vacuum filter in practice can make concentrates of any moisture content to as low as 8 to 10%. Where concentrates are to be briquetted such a low percentage of moisture is not necessary, but should be as high as 15% or more.

An example cited recently in the current technical literature, which gives a method of dewatering flotation concentrates, is the practice of the Inspiration mill in Arizona.¹ Here the concentrates from the flotation

*School of Mines and Metallurgy, Rolla, Mo.

¹See this journal, Jan. 1, 1916, p. 1.

processes and from the tables converge to a drag classifier; the coarse product from this machine is sent to an Oliver filter and the fine product to a V-shaped smelting tank, where it is thickened. The thickened and settled fine from the tank then goes to the filter. The filter cake from the Oliver machine is trammed to a bin and thence loaded into bottom-discharge railroad cars for shipment to the smelter. At the Miami mill in Arizona the flotation concentrate is thickened in Dorr tanks and the thickened product then conveyed by bucket elevators to a group of 12-ft. x 12-ft. Oliver filters. The caked concentrate is scraped off over a steam-heated plate and then removed to a steel storage tank preparatory to shipment to the smelter.

A type of machine brought out in recent years by one of the western companies which is applicable to the dewatering of flotation concentrates is the so-called Ovoca classifier. This is a classifier of the screw type. The froth is broken down effectively, giving a continuous clear overflow solution at the weir and a continuous discharge of dewatered concentrate—moisture, 15-25%. A screw dewaterer is in operation at the Oneida Stag mill at Idaho Springs, Colo. At this place the flotation concentrates plus the table concentrates are passed through a screw dewaterer and the two are thus mixed and dewatered in one joint operation. The dewatering machine removes from 60 to 70% of the slimes with the coarser table product and the overflow removes the balance of the slimes. This latter goes to settling boxes and is there settled and thickened.

The practice of washing flotation concentrate is a development as yet new in American practice. The leading consideration in washing is the removal of part of the insoluble matter whose presence in the final concentrate detracts from its grade. Washing is employed at a New South Wales mill in Australia. Here the flotation product is led into settling bins and washed by means of spray water playing on it as it enters. The effect of this is to disintegrate the froth so that the sulphides sink to the bottom and at the same time part of the floated gangue is carried over the lip by the moving stream of water.

Drying.—This is an important consideration in flotation practice, particularly if the concentrate is to be shipped long distances. The mills, unless indeed they be very large mills, with their smelter on the ground, are often as far as 750 miles from the smelter which consumes their concentrates. Every pound of water in the shipped product has to be paid for as freight, hence the moisture content should be low. Often a wet concentrate is not a marketable product as such, and always excess moisture adds extra cost to the labor of handling. The advantages accruing from dewatering and drying lie in the following, viz.: (1) by reducing the moisture and thus obviating the paying of freight on water, (2) by preventing the loss of slimy concentrates due to leaking tanks and cars and the messy sloppage which comes with the handling of wet material, and (3) by avoidance of delay from

the freezing of concentrates in cold weather. A difference of 3 or 4% lower moisture content may mean the saving of many dollars in the costs of loading and freight.

The practice of handling flotation concentrates at the Engels mill in California is interesting in its uniqueness.² The floated concentrate is first removed to a settling tank outside of the mill building for settling and thickening; the thickened product from here goes to an 8-ft. x 8-ft. Oliver filter, which makes a cake containing 10 to 12% moisture. On account of the long distance which this concentrate has to be shipped, namely, to the Garfield smelter, near Salt Lake City, it is desirable to reduce the moisture to the loss-by-dusting point—about 5 to 6%. To accomplish this an unused drag classifier was being remodeled so that heat could be applied beneath it; the dried concentrate is then sacked in canvas bags and loaded via tramway onto a caterpillar tractor for conveyance. Part of the journey to the railroad is accomplished by motor trucks where the roads are good. At the railroad the sacks are emptied into railroad cars for shipment to the smelter.

The Smelting of Concentrates.

The new conditions imposed by the character of the flotation concentrates forced a change in the details of furnace operation, and hence the metallurgical treatment of such concentrates is an entirely new subject. In the case of copper concentrates the product is improved in copper grade and simultaneously in iron and sulphur and impoverished in silica and alumina, when compared with either direct smelting ore or intermediary mill concentrates. The amount of flux required is then correspondingly lessened, as the charge is usually more fusible. The extreme fineness—*i. e.*, slime character of flotation concentrates—produces a product in which the alumina (if it be present) is in a colloidal condition, and no clay is needed for a binder in briquetting; at the same time its fineness makes drying and filtering difficult, and its wetness makes briquetting impossible without dewatering. At the Braden mill, Chile, elsewhere mentioned, the table concentrate was only fairly fine but was very infusible, due to high silica and alumina; on the other hand, the flotation concentrate was not only very fine and wet but also of a lower silica content, which made it more easily fusible.

In regard to the smelting of flotation products there are several methods which have been in commercial use, namely: (1) direct smelting, (2) sintering and smelting, (3) nodulizing and smelting, and (4) roasting and smelting.

(1) *Direct Smelting.*—This was and still is in part the practice at the Braden mill, Chile, South America. The concentrates were settled but not filtered (this was previous to the arrival of the filter presses) and charged into the blast furnaces direct. In spite of the

²Note—This mill is described in *Mining and Engineering World*, June 24, 1916.

fact that the charge was more fusible than before, the coke consumption increased considerably. The reason for this was that extra heat was required to evaporate the moisture, and, further, that the wet charge "blanketed," so to speak, and was more or less impervious to the blast penetration. The practice of drying and preheating concentrates preparatory to furnace smelting shows an economy of fuel over charging raw concentrates.

(2) *Sintering and Smelting.*—Sintering of flotation concentrates before smelting is comparable to any common sintering operation. At the Herculaneum plant of the St. Joseph Lead Co., already alluded to, the lead flotation concentrate is mixed with the lead table concentrate on a mixing belt, and the mixed product is deposited to sintering machines—Dwight and Lloyd. At the Braden mill, mentioned in the foregoing, the sinter plant consists of four units; each unit is simply a concrete box 50x4 ft., on top of which is placed a cast iron grate similar to a boiler grate. An exhaust fan creates a strong down-draft. The concentrate, spread on the grate in a layer 4 to 6 ins. in thickness or less, is ignited by a layer of shavings or sawdust. Once started, the charge roasts from the combustion of the sulphur and becomes agglomerated into a hard cake, which is broken into pieces 6 to 8 ins. in size. The sintered product thus broken is ready for the blast furnace.

(3) *Nodulizing and Smelting.*—Nodulizing is a continuous process which reduces, by roasting, the sulphur content of the concentrates and produces nodules or balls of the roasted charge. A nodulizer consists of a revolvable steel tube lined with fire brick, similar in appearance to a rotary dryer of the Ruggles-Coles or other type, 8 ft. to 10 ft. in diameter and from 50 ft. to 120 ft. long. The tube is slightly inclined with a slope of about 1 in. per foot toward its discharge end. Firing is accomplished with oil, gas or powdered coal. In the nodulizer the concentrate is heated by the firing and also by the burning of the sulphur in part; the charge soon assumes a sticky, viscid constituency and, due to the revolving, rolling motion of the tube, is "balled" into nodules of varying sizes, which are discharged red hot and thence fed to the blast furnace. The nodulizer thus dries the concentrates and reduces the sulphur content to any desired amount pending on the length of the tube and its diameter—*i. e.*, the time necessary for a unit charge to pass through the tube. The smelting of the nodulized concentrate imposes no new conditions on normal blast furnace operations.

(4) *Roasting and Smelting.*—This is best depicted by Anaconda practice as set forth at length in recent technical literature.³ The installation of flotation at the Washoe works necessitated the roasting of an augmented tonnage of sulphides, and consequently the roasting plant had to be enlarged. The roasters are multiple-hearth furnaces—seven hearths in all—of the

MacDougal type, having a shell diameter of 25 ft. and an inside diameter of 23.5 ft. The flotation concentrates and the fine table products are mixed together, thus insuring a uniform roaster feed. The hot calcines are charged to reverberatories. The practice of firing reverberatories with powdered coal has shown a fuel economy over blast furnace smelting; moreover, the reverberatories demand a fine charge, so that the development of coal dust as a fuel, when applied to these furnaces, has come in proper time to be of great aid in smelting the fine product produced by flotation.

Coal Output of Wyoming in 1915.

The production of coal in Wyoming in 1915 was 6,554,028 tons; an increase of 78,735 tons, or more than 1%, as compared with 1914, according to figures compiled by C. E. Leshner, of the Survey. The greatest increase was in the Rock Springs field, in Sweetwater county, and amounted to more than 122,000 tons. Hot Springs and Converse counties also had increases, but all other counties recorded small decreases. The total value of the coal decreased nearly 5%, from \$10,033,747 in 1914 to \$9,555,804 in 1915.

The increase in the Rock Springs field is attributed to a strong demand for coal by both the railroads and the domestic and steam coal users during the last half of the year, and to the fact that there were no labor troubles or lack of railroad cars.

Normally a considerable quantity of Wyoming coal from the Sheridan field reaches market in northern Montana, Idaho and Washington (in and about Spokane), but Canadian coal now admitted duty free is reported to have partly replaced it, and to that cause the decreased production in Sheridan county is partly due. Abundance of water in the Black Hills for the hydro-electric plants cut off a part of the market for Wyoming coal. The number of men employed in the coal mines decreased from 8118 in 1914 to 7244 in 1915, but the average number of days worked increased from 192 to 201.

Refining Molybdenum.

Courtenay De Kalb, Tuscon, Ariz., has devised a method of refining molybdenum from its concentrate by a hydro-metallurgical process, by which is obtained a product free from copper, lead and arsenic, and containing only traces of phosphorus. This method, a patent on which has been allowed, is a simple one, the cheapest solvents in the market being employed. The estimated cost of refining is less than 20 cts. per pound of metallic molybdenum produced. The process is to be further tested on a commercial scale at eastern metallurgical works. De Kalb refers to the wide occurrence of molybdenum throughout the southwest, and thinks that, as a by-product, this metal may be produced so cheaply as to make it a steady competitor of tungsten.

³See this Journal Jan. 1, 1916, p. 3.

What the Mining Companies are Doing

Lake Copper Co., Michigan.

The report of the Lake Copper Co. for the fiscal year ended April 30, 1916, shows a production of 1,581,071 lbs. of copper sold at average price of 20.149 cts. a pound. Profit for the year was \$87,018. Surplus was \$254,164, compared with \$167,115 on April 30, 1915. Income account follows:

Receipts:	
Copper sold	\$318,581
Interest	5,498
Miscellaneous receipts	916
Sale of land	1,325
Assessment account	7,686
Total	\$334,007
Expenditures:	
Running expenses at mine.....	\$202,896
Smelting, freight to market copper and general expense	30,688
Ontonagon County taxes.....	11,302
New equipment	2,101
Total	\$246,987
Excess receipts over expenditures.....	\$ 87,018
Surplus May 1, 1915.....	167,145
Surplus April 30, 1916.....	\$254,164

Operating results compare with year ended April 30, 1913, the latest year of continuous operations, as follows:

	12 mos. end. April 30, 1913.	9 mos. end. April 30, 1916.
Tons rock stamped.....	*83,109	59,848
Pounds mineral produced.....	2,153,128	2,511,216
Pounds mineral per ton rock stamped.....	25.9	41.96
Refined copper produced.....	1,300,562	1,581,071
Per cent refined copper in mineral.....	60.68	62.96
Pounds refined copper per ton rock stamped	15.39	26.42

*12,141 tons came from stock pile.

Uncle Sam Co., Utah.

The annual statement of receipts and disbursements of the Uncle Sam Mining Co. for the year ended May 31, 1916, shows cash on hand amounting to \$8703.51. The statement shows as follows:

Receipts:		Tons.	Value.
Ore sales, zinc ore.....	183,396	\$ 6,824.31	
Ore sales, lead ore.....	520,744	7,973.14	
Total		\$14,796.45	
May Day Mining & Milling Co. dividends.....		33.11	
General expenses (Sundry receipts).....		52.00	
Cash on hand, June 1, 1915.....		9,333.10	
Total		\$24,214.66	
Disbursements:			
Ore sales, paid lessees and expense on ore.....		\$ 5,568.66	
Mine expense		2,179.79	
Mine labor		2,511.38	
Assaying		75.40	
General expense		702.84	
Salaries		1,200.00	
Taxes		273.08	
Totals		\$15,511.15	
Cash on hand, June 1, 1915.....		8,703.51	
Total		\$24,214.66	

Butte & Superior.

Butte & Superior Co. for purposes of taxation reports for fiscal year from June, 1915, to June, 1916, net proceeds \$10,497,979, against net for year from June, 1914, to June, 1915, of \$2,648,450.

The net proceeds for the year just closed showed within about \$100,000 of being four times about what they were the year before.

Report shows 591,562 tons of ore were mined of the gross value of \$20,271,949, or an average of \$34.269 per ton; cost of extracting, \$5.488 per ton, or total, \$3,246,276; cost transportation, \$2.15 per ton, or total of \$1,272,117; cost reduction, \$0.7149 per ton, or total of \$1,229,117. Expenses were as follows: Labor, \$2,217,755; supplies, \$1,028,521; construction work, \$605,823; improvements at Black Rock mine, \$414,034; total of \$4,266,134.

Treatment of the ores is done at Bartlesville, Okla.; Caney, Kas., and East Helena, Mont.

Inspiration Con., Arizona.

All but \$81,300 of the two issues totaling \$10,500,000 of Inspiration Con. Copper Co. bonds have been turned into stock. There now remains outstanding \$74,000 first mortgage bonds and \$7300 debentures.

The bond conversion was worked out as follows:

	Total issued.	Converted.	Outstanding.
First mortgage	\$ 6,000,000	\$ 5,926,000	\$74,000
Debentures	4,500,000	4,492,700	7,300
Total	\$10,500,000	\$10,418,700	\$81,300

By the time the next dividend becomes payable there appears to be every likelihood that practically all fixed charges ahead of the stock will have been eliminated through complete conversion of the two issues of bonds.

Rambler-Cariboo, B. C.

In addition to paying the remainder of the bills payable account of a year ago of \$10,000, the Rambler-Cariboo Mines, Ltd., B. C., disbursed \$52,500 in dividends and has cash in the bank amounting to \$16,000. Ores unsettled for amount to \$75,000. The following shows receipts and disbursements for the fiscal year ending April 30, 1916:

Receipts:—		
Balance forward		\$ 5,324.89
Ore in transit from previous year.....	\$33,801.26	
Ore, lead	89,567.95	
Ore, zinc	18,188.66	
		141,557.87
Transfer fees	\$ 141.50	
Sale of compressor	748.50	
Sale of wagons	200.00	
		1,090.00
Surprise mine, for milling ore.....		7,991.65
Total		\$155,964.41
Disbursements:—		
Bills payable	\$10,000.00	
Dividends, B 1, 2, and 3.....	52,500.00	
		\$ 62,500.00
Ore production	\$27,294.07	
Development	13,384.70	
General mine expenses	9,486.11	
General expenses	9,401.57	
Milling	17,339.65	
		76,906.40
Mill Equipment	\$ 354.00	
Machinery and plant	14.06	
Stores purchased	740.15	
		1,108.21
		\$140,514.61
Less:—		
Special discounts	\$ 71.77	
Profit on mine boarding house	987.35	
		1,059.12
		\$139,455.49
Cash on hand		16,508.92
Total		\$155,964.41

U. S. Smelting.

Of the \$5,072,840 earnings after all charge-offs reported by United States Smelting Co. for the 5 months ended May 30, it is understood that less than \$1,000,000 were derived from Mexico. In other words, less than 20% of the current year's earnings have come from across the border.

In the 1915 results Mexico accounted for about 21% of the net earnings. It is therefore fair to say that Mexico for some time has been contributing only about 20% of the Smelting profits and in recent weeks even less.

The unimportant part which Mexico has been playing in the record-breaking earnings can be gathered from the production figures. For the first 5 months of this year the output of silver was only 2,500,000 ozs., or at the annual rate of 6,000,000 ozs., whereas normal production is 50% in excess of this figure.

Although operations in Mexico have practically ceased

and all of the American employes are supposedly at Vera Cruz or en route to the States, conditions are such that should quiet be restored or law and order forced through American invasion or intervention production can be rapidly resumed. Prior to the last year or two it was the Smelting Co. custom to keep the reserves of ore actually blocked out at about 1½ years' full production rate. With the work done on the Real Del Monte strike, however, ore reserves have been blocked out for a long time to come.

Buffalo Mines, Ltd., Ontario.

The following report has been issued by the Buffalo Mines Co. for the fiscal year ending April 30, 1916:

Earnings—	
Gross income from mining operations.....	\$524,973.46
Transportation and treatment	85,928.76
Other income	712.20
Total income	\$439,756.90
Expenses—	
Mining	89,490.88
Milling	64,294.00
Cyaniding	16,872.35
Ray lease—operating	10,741.12
Shops	3,178.45
Stable	2,248.91
Repairs and renewal.....	2,520.80
Boarding house	1,164.58
Surface prospecting	371.89
Depreciation	24,427.15
Administration and Financing Charge—	
Insurance	8,744.14
Taxes	5,322.41
Legal and traveling.....	2,470.53
Light and heat.....	3,072.30
Salaries and miscellaneous.....	16,146.79
Superintendence and office expenses.....	5,342.39
Interest	9,797.28
Total expenses	\$266,205.97
Net income	\$231,344.24
Surplus April 30, 1916.....	\$610,888.80

The following is the condensed balance sheet:

Assets—	
Cash and accounts receivable.....	\$ 16,985.78
Ore and bullion.....	605,310.97
Stores and supplies.....	61,948.72
Plant, tools and equipment.....	136,054.57
Mines Water Co.....	6,305.40
Mining rights	907,092.86
Prepayments	5,297.55
Total	\$1,738,995.85
Liabilities—	
Notes and accounts payable.....	\$ 108,351.25
Reserve for transportation and treatment of ore precipitates on hand, etc....	19,755.50
Capital and surplus.....	1,610,888.80
Total	\$1,738,995.85

Standard, B. C.

The operating statement of the Standard Silver Lead Mining Co. for the year 1915 is as follows.

Income—	
Preliminary settlements, 8364 tons of lead ore and concentrates	\$686,288
Final settlements	9,416
Zinc sales	60,188
Umpres	725
Total ore sales.....	\$756,618
Less zinc penalty on lead product.....	4,465
Income from ore sales.....	752,153
Other income	47,320
Total income	\$799,473
Disbursements—	
Operating expenses	\$201,459
Other disbursements	70,400
Home office expenses.....	17,183
Dividends paid	250,000
Transferred to surplus.....	260,430
Total disbursements	\$799,473

Consolidated Coppermines Co.

The gross income of \$356,318 was realized by Consolidated Coppermines during its fiscal year ended April 30. Production was 1,616,502 lbs. of copper, 556 ozs. of gold and 1445 ozs. of silver.

Development work was resumed last February and in the ensuing 60 days there were added to reserves 466,510 tons of developed ore averaging 1.68% copper.

It is estimated that all properties controlled by Consolidated Coppermines now have developed and partly developed 25,867,850 tons of ore averaging 1.141% copper.

The financial statement of the Consolidated Coppermines Co. shows a deficit on April 30 last of \$180,781, an increase during the year of \$64,197. Giroux, the operating subsidiary, showed net profits for the year 1915 of \$63,584.

Miscellaneous Company Notes.

Total earnings of the Tonopah Extension Mining Co. for the first 4 months of 1916 amounted to \$287,632, derived from the production of 6753.31 ozs. of gold and 710,701 ozs. of silver.

Tonopah-Belmont's results for May show: Dry tons milled, 12,824; ounces gold bullion produced, 2363.75; ounces silver bullion, 226,987; net profit for May, \$126,263.

The report of the Tonopah Mining Co. for May shows as follows: Dry tons milled, 9239; average value per ton, \$13.30; ounces gold and silver bullion shipped, 125,000; value of bullion, \$107,100; net profit for May, \$26,330.

Operations of the McIntyre Porcupine Mines, Ltd., for the quarter ended March 31, 1916, are given as follows: Tons milled, 27,248; value per ton, \$7.74; gross value, \$210,840; recovery, \$201,110; operating cost, \$104,982, or \$3.85 per ton; operating profit, \$97,128.

By agreement of counsel the petition in the Massachusetts Supreme Court of A. S. Bigelow for a review of the Old Dominion case on the ground of newly discovered evidence has been dismissed. No financial consideration of any kind is involved in the settlement of this last phase of the long drawn out litigation.

D. C. Jackling is quoted as follows: "Butte & Superior has mined 1,250,000 tons of ore during past 5 years from the upper levels, and yet there is today more than double the amount of ore in sight on these levels that was calculated as fully developed when we took the property." He states further that the company can produce its product for 4 cts. a pound and can earn \$12 a share on 6-ct. spelter.

May was an unusually good month for the Utah-Apex Co., earnings reaching up to the high level of \$152,000. The company's financial position is steadily improving, and after the payment of the July 1 dividend of 25 cts. per share—which calls for \$132,000—there will be over \$500,000 in cash on deposit in Boston banks. On the basis of April and May net the company earned at the rate of \$1,800,000 per annum, the equivalent of \$3.50 per share on 522,000 shares outstanding—or 80% on selling price of 4%.

Sales of the National Lead Co. so far this year have been more than satisfactory. What is probably the largest business ever recorded by the company has been done in all products except white lead, which has been unfavorably influenced by the backward season. It is expected, however, that the demand for this product will pick up as summer progresses and will reach, if not exceed, normal proportions. The United States Cartridge Co., in which the National Lead Co. holds an important stock interest, is running to capacity, employing between 8000 and 9000 hands, against 400 in the early part of 1914.

Managing Director D. C. Jackling of the Utah Copper Co. has gone over the plans for the new leaching plant and he announces that the construction work will be well on its way within a few weeks. The capacity will be 2500 tons daily and it will treat solely the ore that forms in the oxides and carbonates. The sulphide product will continue to be treated by the old process of concentration, there having been installed at the plant a number of the Janney machines, which makes a higher recovery than formerly under the vanner table process. Sulphuric acid will be employed in the leaching plant and this product will be made by the Garfield Smelting Co., which has a copper smelting plant of 6000 tons daily capacity near the Utah Copper mills. It is estimated that there are more than 40,000,000 tons of this oxide and carbonate ore-bearing rock to be treated and a high-grade copper recovery will be made from this product. The new plant will be operating within the year.

*Illustrated.

Anaconda Copper Co.'s Wonderful Earning Powers.

A prediction a few years ago that a mining company would show net profits in a single year of \$45,000,000 would have been laughed to scorn. Yet today this is possible for the Anaconda Copper Co. Figuring on the basis of present production of approximately 30,000,000 lbs. of copper a month; produced at a cost of 10 cts. a pound and sold at an average of 24 cts. per pound, there results a total net profit of close to the amount mentioned above.

In addition to the above Anaconda derives substantial profits from spelter and the income from smelting and refining Inspiration and Miami concentrates.

The company's 25-ton electrolytic zinc plant is running at capacity; in fact, it is now producing at the rate of 24½ tons per day. This plant when completed will cost a tidy sum, but its product has been sold well into 1917 at a profit of \$4,000,000.

Anaconda's big construction campaign, with the exception of the work necessary to increase the zinc plant to 100 tons daily capacity, is now 100% complete. The company is prepared to make the record of a life-time—low costs, high recoveries and an output 40,000,000 lbs. per annum larger by reason of flotation—without any increase in the tonnage of ore treated.

Mining Towns Better as a Result of Prohibition.

At the recent national conference on charities and correction at Indianapolis many practical points were presented covering the results of extended studies as to the attitude of mining companies, railroads, public service corporations, etc. From returns received from employers of 750,000 people alcohol is forbidden in their plants and in many instances its use is considered in the promotion and retention of employees.

This attitude on the part of employers brings before every man the necessity of total abstinence.

Reports received by Mining & Engineering World from many mining towns where alcoholic liquors are not for sale indicate that total abstinence on the part of mine workers has resulted in their becoming better workmen, better husbands and fathers, and ready for work on Monday mornings following pay days.

Other results mentioned are to the effect that many miners who were always behind at the company stores, when the bar rooms drew a large part of their wages, now have balances due them each month, many having savings accounts. Furthermore, their wives and children are comfortably clothed, which was too often not the case when they were spending their earnings for drink.

Altogether, labor conditions have been greatly improved in those mining towns and there has been no falling off in the number of laborers by reason of prohibition.

A British Columbian Mineral Boom. Dollar Financing of Metal Exports.

Not since the early boom days of British Columbia has that mining section experienced such a demand for copper, lead and zinc as that now operative because of the war. The boom in mining has been most remarkable during the past year. The shipment of silver-lead from British Columbia mines to the Trail smelter alone for the year ending April 30, 1916, aggregated 14,586 tons; while 1415 tons were shipped over the Canadian Pacific railway to American smelters, in addition to 2660 tons of zinc ore and concentrates.

The mining industry in British Columbia now gives employment to 18,000 workmen, supporting approximately one-third of the population of the province. The industry is capable of great expansion, not only in the production of metals and coal, but in the utilization of these mineral resources in the industrial life of the people.

The copper production of the province is nearing an aggregate of 100,000,000 lbs. per annum. The refining of copper in this province would save \$2,000,000 in transportation of blister copper to eastern refineries and in the refining charges.

There is under construction at Trail, a spelter plant which, when completed, will produce 50 to 75 tons of spelter a day, thus supplying the second metal requisite for the development of brass founding industries, galvanizing works, manufacture of paints, electrical supplies and instruments.

A Factor in Plant Design.

An ore-dressing or metallurgical plant may be likened to the human body. It consists of a number of different departments, each of which, like the organs of the body, has some special and necessary function to perform. When anything goes wrong in one department the effect is felt in the impaired efficiency of the plant as a whole. Unless all departments are planned and managed so that they work in harmony, the best possible results and the highest efficiency cannot be attained.

It is important, therefore, that the designing and equipment of such plants be under the direction of one man who thoroughly understands the technical requirements involved, not only of each individual department of the plant, but of the plant as a whole.

Many a plant is not giving the results expected of it because the designer had but an incomplete knowledge of the work which was to be accomplished by the completed plant. It is not sufficient that the designer of a plant have a knowledge of the theoretical principles involved, but he must also have a practical knowledge of the difficulties that are to be met and overcome, that the results of his work will be a plant that is adapted to the ores to be handled, and to other conditions under which it is to operate.

Due to the unsettled conditions in exchange, American producers of copper and spelter have been unwilling to assume the risks of fluctuation and have lately adopted the suggestion made about a year ago by Leopold Frederick, of the American Smelting & Refining Co., that they require the purchaser to open 90 days' sight credits in dollars with New York bankers.

This recommendation, according to *Financial America*, was at first not very favorably received, but recently it is learned dollar credits amounting to many millions have been opened for the accounts of French and Italian concerns with a prominent trust company and several international banking houses. Most of the London banks, so far, have been unwilling to open such credits in New York, but should they do so, Mr. Frederick believes that they would facilitate materially the task of the English government of steadying the sterling rate in New York.

Prior to the adoption of Mr. Frederick's plan payments for metals exported to Europe have been effected by the sellers drawing in pounds, francs, or lire on the purchasers and selling their bills in the New York market.

Without doubt the evolution of engineering skill and proficiency owes much to the remarkable advancement of mining science and mining development. And along these lines the wonderful production of mining machinery, the progress in electrical invention, the perfection of gas engines and all the allied interests of construction and development have kept engineering skill on edge. The theoretical engineer has no place in this practical age. He must work his theories into profitable practice, and it is well that he is put to his wits' end frequently to keep abreast with or a little in advance of the tremendous business energy in all lines, of which mining is a powerful lever.

That American mining companies are in the forefront in sharing profits with their employes is proved by the repeated voluntary increases in wages that have been made during the period of prosperity that has been enjoyed by the companies. The latest along these lines is from the Calumet & Hecla Mining Co. and its subsidiaries, employing some 11,000 men in mines, mills and smelters, which announces that the 10% bonus will be continued and an additional premium of 25 cts. a day from July 1 to Dec. 31, 1916. An additional disbursement of \$426,500 will be made in January, 1917.

The inquiry for copper for prompt and last quarter delivery continues small but steady and the tone of the market is quoted firm. Most of the large producers still are sold up so far ahead that they cannot accept orders for nearby delivery and the result is that many small consumers who want copper now are endeavoring to cover in the resale market.

PERSONAL.

R. D. Agassiz, president of the Calumet & Hecla Co., is at Calumet, Mich.

Frank A. Love has been appointed manager of the Elkhart mine, Chloride, Ariz.

P. S. Haury, mill superintendent of the Seoul Mining Co., Korea, is in San Francisco, Cal.

L. S. Cates, general manager of the Ray Con. Co., Ray, Ariz., has recently been in Boston and New York.

L. A. Friedman, general manager of the Rochester Mines Co., Rochester, Nev., has recently been in Salt Lake City, Utah.

M. A. Rowan is now in charge of the coal mining department of the Chicago & Eastern Illinois Railroad Co., at Nokomis, Ill.

M. P. Kirk, of Kirk & Leavell, Salt Lake City, Utah, has returned from a trip to New York, Chicago, and other eastern cities.

H. K. Burch, chief engineer of the Inspiration Copper Co., Miami, Ariz., has left for a trip including the larger eastern cities.

J. T. Miliken, mining engineer, Denver, Colo., has been examining properties in the Coeur d'Alene district, Idaho, and is now in Spokane, Wash.

S. Nakagawa, mining engineer of the Imperial Bureau of Mines, Tokio, Japan, is now in Cripple Creek, Colo., studying mining methods.

H. F. Fay, president of the Old Colony, Contact, and Union Land companies, is at Houghton, Mich., on business connected with these companies.

W. E. Thorne will remain with the Lenskoie Co., Siberia, as geologist in charge of the sampling and selection of the company's dredging ground.

J. Dana Sperr, mining engineer with the Tom Reed Gold Mines Co., Oatman, Ariz., has resigned and will return to Houghton, Mich., for the present.

Hugh L. Wright, formerly with the Arizona Copper Co., Clifton, Ariz., is now with the American Smelting & Refining Co., Spokane, Wash., on the engineering staff.

John D. Ryan, president of the Anaconda Copper Co., is with his family spending a few weeks with their relatives at their old home in the Michigan copper country.

G. A. Guess, in charge of metallurgy, University of Toronto, Toronto, Ont., has been engaged by the Vermont Copper Co., to reopen the old smelter at South Stafford, Vt.

F. M. Sylvester, former general manager of the Granby Con. Co., Vancouver, B. C., has recently been elected managing director and will hereafter make his headquarters in New York.

Sumner S. Smith, federal mine inspector, Juneau, Alaska, is now inspecting the Willow Creek district north of Knik and will inspect the Moose Creek coal fields on his return to Juneau.

W. A. Paine, president of the Copper Range and Lake and director of other companies in the Lake Superior district, is with his son and assistant, F. Ward Paine, inspecting these properties.

Douglas S. Buchanan of Houghton, Mich., clerk of the New Arcadian and New Baltic companies, has gone with the naval reserves to the training ship at Mackinac. He has been succeeded by Fred Cross.

C. A. Foster, formerly mayor of Hailebury, Ontario, and a very well known mine owner and promoter, has become a lieutenant in the Canadian army. There are three other graduates of the Michigan College of Mines who are lieutenants in the British forces: Harold Whittingham in the artillery, R. H. Anderson in the aviation corps, and V. H. Lavery. Clinton Ball and L. B. Schwaderer, who about 6 months ago went from the Michigan College of Mines to the Transvaal as mining engineers, have joined the engineering corps and are at the training camp at Pooghsroom on their way to German East Africa.

OBITUARY.

Michael J. Drum, a well-known miner operating in the Goldfield district and other Nevada sections, died recently at Bonnie Clare, Nev. He was born in Ireland 75 years ago and came to this country at an early age. He was a veteran of the Civil war and after the war he entered the newspaper business in Chicago. Later he was sheriff of Fremont county, Colorado, going to Goldfield, Nev., after leaving that office. At the time of his death he owned the Oriental mine at Gold Mountain, Nev.

SCHOOLS AND SOCIETIES.

Massachusetts Institute of Technology.—A class of seven under the direction of Prof. C. E. Locke is visiting the mines and mills in the Lake Superior copper district.

NEW PUBLICATIONS.

Geology and Underground Water of Luna County, New Mexico. By N. H. Darton. Washington, D. C., U. S. Geol. Surv. Bulletin 618; pp. 188; illustrated.

For the greater part the bulletin treats on the separate descriptions of the formation occurring in the different geological eras. The rocks and general nature of the formation classified under the different eras are described and followed by a review of the structural geology of the area being covered. Though some pages are given to the mineral resources of the district, those confined to the water resources are here given more importance. The area included is known as the Deming quadrangle.

Distribution of Energy in the Visible Spectrum of an Acetylene Flame. By W. W. Coblenz and W. B. Emerson. Washington, D. C., U. S. Bureau of Standards. Scientific Paper 279; pp 10; illustrated. For sale by Mining World, 15c.

It is important from a practical standpoint to know the quality of acetylene light—that is, the relative proportion of the different colors in the visible spectrum of the acetylene flame. It is also important to know the luminous efficiency—that is, the ratio of light to heat in an acetylene flame. The publication enclosed gives the numerical results of a research on the measurement of the energy distribution in the visible spectrum from the acetylene flame—data of value in the scientific study of light sources.

Some Manganese Mines in Virginia and Maryland. By D. F. Hewett. Washington, D. C., U. S. Geol. Surv. Bulletin 640-C; pp. 35; illustrated.

On account of their proximity to the steel centers of the east these two states have always played a prominent part in the production of manganese. This paper was compiled as a result of many brief visits into the districts during 1913, 1914 and 1915. For the greater part it describes separately the various manganese properties visited. In addition to describing the occurrence of the ores it is brought out that there are four different types of deposits, one of which has not previously been recognized. These four types give the

same problems of exploitation, but the persistency with depth seems to vary with each.

Tests of Reinforced Concrete Flat Slab Structures. By A. N. Talbot and Willis A. Slater. Urbana, Ill., Engg. Experiment Station. Bulletin 84; pp. 128; illustrated.

Complete and detailed tests made on five different buildings are described separately. Each was made for determining different phenomena and in each minute details of the test and results obtained are given, with a brief discussion on the same. For example, test IV is on the Schulze Baking Co. building. The structure is described and followed by a description of the tests and their results, with much of the information tabulated or plotted in a curve.

TRADE PUBLICATIONS.

Pulmotors. The Draeger Oxygen Apparatus Co., Pittsburgh, Pa. Folder; pp. 4; illustrated.

An announcement of the new type B pulmotor is here made and a complete general description is given of its operation and construction. For making the latter more clear sectional drawings of the apparatus have been reproduced and illustrations given showing the pulmotor in practical use. In a substantial carrying case the new type weighs 12 lbs. complete.

Automatic Measuring Devices. Ogle Construction Co., Chicago. Pamphlet; pp. 4; illustrated.

It is the intention of the manufacturers to have this measuring device replace the scales of different types now being used in checking up materials used. An illustration of the device and some places where it has been installed are given. They claim to be able to install the device, which is placed at the mouth of the chute, by doing nothing more than slightly raising the side baffles of the chute and in no way altering the present bin construction.

Flexible Couplings. J. R. Shays, Jr., 47 West 34th street, New York. Folder; pp. 6; illustrated.

Sectional drawings of the coupling are shown and a table gives details of the different sizes and prices of the same. In this connection directions are given for selecting the proper coupling from the table. The couplings are made in bores from $\frac{3}{4}$ to $7\frac{1}{2}$ ins., the maximum R.P.M. for which are 3600 to 1000. Different sized line-shafts may be connected, it is stated. The casing of the coupling is constructed so as to be rigid and may therefore be used as a line-pulley for the belt transmission of power.

Supplies and Data for Reinforced Concrete. Corrugated Bar Co., Buffalo, N. Y. Booklet; pp. 96; illustrated.

It will be found of use not only as a reference regarding the company's products, but further for specifications, data and construction details connected with reinforced concrete work. Many tables and drawings are shown which will be of interest to the construction man or designer. It has been brought out in the introduction that no attempt has been made in compiling the booklet to dwell in detail on all of the company's products, but simply to give clear and brief data which is absolutely essential.

Pulverizing Mills. Lehigh Car, Wheel & Axle Works, Cata-sauqua, Pa. Catalog No. 70; pp. 61; illustrated.

The mills herein considered are of two different types. The sweep-discharge type is made in 33-in. and 42-in. sizes and the fan-discharge type is made in 33-in., 42-in. and 57-in. sizes. A list of materials are given for which the mill will be found suitable to crush. The sweep-discharge type is then described and specifications are given in which it is stated that the mill will handle from 2 to 4 tons of material per hour. Separate sectional views are given of both sizes and in this connection the different parts are numbered and listed on the opposite page. A similar form is given to the description of the fan-discharge type. The concluding pages are given to practical installations, using both direct electric

drive and line shafts. The preliminary preparation of materials is treated separately.

Wooden Piping. G. R. Wood's Sons Co., Sheffield, Pa. Catalog; pp. 16; illustrated.

This catalog gives details, prices, description of wooden pipe and the methods used for its manufacture. It is stated that the pipes are bored with a special bit from solid pieces of white pine timber. The average length is 14 ft., while the pipe varies from 8 ft. to 16 ft. Pipes are listed from 2 to 6 ins. internal diameter, and all are connected with a taper joint and mortise. It is stated that sulphur and acid fumes will not corrode it, nor will fluids be tainted. It is also brought out that the pipe is less liable to freeze and burst.

Concrete Mixers. Archer Iron Works, Chicago. Catalog No. 25; pp. 16; illustrated.

In this catalog the Archer No. 1 mixer is described in detail as regards its construction, what it will do and why the mixer is capable of performing its work as stated. It is of the small type and is intended to handle from 35 to 70 tons per day of 10 hours. The catalog gives as its features: End discharge; it can be backed to the form and place the concrete direct without haulage; the engine is mounted on top of the all-steel frame out of the way; the machine can be moved by one man in a similar way to any 2-wheeled vehicle; it is entirely gear-driven, with no chains.

PATENTS RELATING TO MINING.

Air Compressor. Michael Reisner, Cincinnati, Ohio, assignor, by mesne assignments, to Worthington Pump and Machinery Corporation, New York, N. Y. (1,185,942; filed March 4, 1915.)

Process of Treatment of Anode Slimes and Similar Materials. Francis C. Ryan, Hammond, Ind., assignor of one-half to United States Metals Refining Co., Chrome, N. J. (1,185,005; filed Feb. 24, 1914.)

Air Compressor. Samuel D. Black, Baltimore, and Alonzo G. Decker, Orangeville, Md. (1,187,031; filed June 4, 1915.)

Vacuum Ore Separator. Harry H. Baer, Orrville, Ohio. (1,186,874; filed Jan. 18, 1916.)

Double-Acting Grinding Pan-Mill and Amalgamator. Charles Davey Tregoning, Grass Valley, Cal. (1,186,709; filed Oct. 28, 1915.)

Concentrating Table. Howard A. McClelland, Allensworth, Cal., assignor of three-fourths to H. H. Tucker, Los Angeles, Cal. (1,186,811; filed Sept. 28, 1915.)

Coal-Sampling Machine. Lewis Lazell Beeken, Pittsburgh, Pa. (1,186,646; filed July 6, 1915.)

Dredging Bucket. Gordon R. Rowan, Oak Ridge, Mich., assignor of one-half to Roberts P. Hudson and Albert B. Davidson, Sault Ste. Marie, Mich. (1,186,684; filed Sept. 9, 1914.)

Gold-Saving Apparatus. Ernest H. Gagnon, Billings, Mont. (1,186,304; filed Nov. 23, 1915.)

Gas-Analyzing Apparatus. Henry Leland Lowe, Pittsburgh, Pa. (1,186,014; filed Feb. 27, 1911.)

Crushing Machine. Axel G. J. Rapp, Chicago, Ill., assignor to Link-Belt Co., Chicago, Ill. (1,185,937; filed March 29, 1915.)

Process of Treating Ores. Royal S. Handy, Kellogg, Idaho. (1,185,902; filed Oct. 28, 1914.)

Tunneling Machine. Carl W. Hodgson, Denver, Colo. (1,185,797; original application filed Nov. 5, 1909; divided and this application filed Dec. 3, 1912; renewed Oct. 23, 1915.)

Process of Treating Metal and Mineral-Bearing Materials. John L. Malm, Denver, Colo. (1,185,817; filed Feb. 21, 1911.)

Support for Coal and Rock Drills. Nils D. Levin, Columbus, Ohio, assignor to the Jeffrey Manufacturing Co., Columbus, Ohio. (1,185,809; filed July 28, 1914.)

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Knik.

The Willow Creek Mines Co. has been formed to operate in the Willow Creek district north of this city. In the forming of this company Messrs. Doherty and Thompson were the principal parties. The holdings include the lease on the Gold Bullion mine, one of the largest producers in the district. Five additional stamps are to be installed this season. The camp will soon be reached by the government railroad from Anchorage, and freight will only have to be hauled 12 miles, instead of 35 miles as at present. The operators will use Anchorage as their base of supplies as soon as the road is completed to Moose creek, which is expected to be some time this month. The additional developments undertaken this year will be considerable.

Fairbanks.

Cleveland & Howell of Woodfortune are again to take out a big season. Their first cleanup, made recently, amounted to \$68,000, according to advices from the lower river.

According to Commissioner Vinal "Boob and Mastodon creek districts are progressing. Cooper, the center, is located at the mouth of Mastodon creek, on the Tolstoi river, 2½ miles from discovery, Boob creek. Steps are now being taken to have Cooper incorporated as a town of second class. I am of the opinion that Cooper will be the center of activity in this section for the reason that it is near and convenient to already found pay. Horse and power boats can reach Cooper also. I think it is about 25 miles to Ditna river by water, where large boats can land supplies. The country has been indiscriminately staked. At this writing Boob creek shows up the best, although Mastodon and its tributaries look good. Recently a discovery was made on Wilson creek that promises to turn out well. A great deal of prospecting is now under way along the creek channels, but I believe that the pay will be found more on the benches than along the channels. Up to the present little has been done except staking claims. They are hauling supplies from Ophir, Ruby and Iditarod. On Boob creek pay that will run fully \$3 per foot has been found. On Mastodon creek 5 miles from Boob prospects that practically amounts to pay have been found in two holes. On Wilson creek, a left limit tributary of Mastodon creek, good prospects have been found. Ten miles from Boob creek, on Madison creek, good prospects have been found, and on Meier and Esperant creeks, tributaries of Madison creek, good prospects have been found." He further states that undue reports have been made and that considerable work is still necessary to bring the camp in as a good producer.

ARIZONA.

Tucson.

The United States Smelting, Refining & Mining Exploration Co. has started churn-drill exploration work in Tortilla mountains, 15 miles northeast of Redrock and 45 miles north of Tucson, under direction of F. B. Weeks, who recently opened an office for the company in Tucson. This work is in the schist area, where there are surface showings of copper carbonates. This is known as the Durham group, on which the company has a bond.

The Roadside group, embracing 500 acres in Rorkruger range, 37 miles west of Tucson, is being developed for an

eastern capitalist, under direction of Courtenay DeKalb, E. M. The first shaft sunk showed a disseminated deposit of chalcocite, 65 ft. thick, assaying 2% copper and 5 ozs. silver. Below this was an oxidized zone, containing copper oxides and native copper. The main 2-compartment shaft being sunk is expected to open a second zone of enrichment at permanent water level. One feature of the deposit is the existence of cinnabar and antimony in places.

The Cobriza Mines Development Co., Johnson, and New York, controlled by the Goodrich-Lockhart Syndicate, has a bond to purchase the defunct custom smelting plant at Benson, the property comprising a 150-ton blast furnace, blower, boilers, sampling plant, engines and a 60-acre site; also a silver-lead slag dump of 100,000 tons, resulting from former smelting operations, and reputed to carry silver and gold of value of \$2.50 to \$5 per ton.

Jerome.

The surface improvements at the property of the United Verde Extension Co. are practically completed and are aiding materially the work of getting out ore. A new compressor has been installed, a change room with shower baths has been erected and a blacksmith shop, carpenter shop and warehouse built. The lower workings carry 60 ft. of carbonate ore that averages 40% copper and 205 ft. of ore, including the carbonate, that averages 20% copper.

The United Verde is outputting an average of 5,000,000 lbs. of copper per month and will soon be outputting 8,000,000—the figures quoted representing the returns on ore shipped from the mine to the smelter at Clarkdale.

Following the discovery of a body of high-grade copper sulphide in the workings of the Lone Pine Verde Copper Co., a plant of machinery has been ordered. The property adjoins the Copper Chief in the lower Verde contact.

Mining operations at the property of the Dundee-Arizona Copper Co. are being furthered by a 25-hp. hoist and an 8 by 8 Sullivan compressor, recently installed. Shaft sinking has been resumed at a depth of 200 ft., the objective being the 1000. Scotch mining men are financing the enterprise.

The mill at the Copper Chief mine, located about 4 miles south of Jerome, is treating 125 tons of gold-silver ore daily. Worked originally as a gold proposition, the mine is now producing a good grade copper ore in its lower levels. The latter is going forward to smelter at the rate of 30 tons per day.

Prescott.

A deposit of high grade copper ore of promising possibilities has been encountered at a depth of 400 ft. in the workings of the Black Rock Co. in the southern part of Yavapai county. The management has decided to sink the shaft to a depth of 800 ft. and at that level to again cross-cut the ore. While this work is progressing further development will be prosecuted in ore on the 400 level.

George W. Long and James L. McIver, together with W. K. Ridenour, are turning their attention to mining properties in Yavapai county with a view to extensive investments therein. Their first venture outside of the Oatman field was made the last week in June, when they purchased a large block of stock of the Tiptop Con. Mining Co., whose holdings are located in the southern part of Yavapai county, in the vicinity of the Agua Fria river. Under the terms of the agreement with the Tiptop directorate mining operations are at once to begin on an extensive scale, with a view to getting out a large tonnage of the tungsten-silver ores that have been opened to a depth of 800 ft. To that end the main working shaft is immediately to be unwatered below the 400 or tunnel level. All ores mined are to be treated at

the company's mill. The high-grade tungsten and silver concentrates will then be shipped to Pittsburgh, Pa.

Mining conditions in the McCabe section continue to improve. A. W. Davis, general manager of the Great Southern Co.'s property, has opened an ore body that is causing considerable attention. At the Lady Alday, Smith Bros. have increased the working force, have sunk the main shaft to 160 ft. and have equipped it with efficient machinery. The ore showing is above average for that section.

Three carloads of high-grade gold ore were sent to smelter in June from the Davis mine on Slate creek. Two lessees on the property are shipping ore regularly. Including the output of the Dunkirk, the Slate creek section is outputting better than 500 tons of ore per month.

A camp has been established at the Magnolia property, located about 2 miles east of Prescott, and a force of miners is now engaged in tunnel operations. The property is adjacent to the holdings of the Bullwhacker and carries the extension of that ore body. C. R. Wallace is the owner.

The concrete walls and foundations for the flotation plant of the Stoddard Milling Co., located on the Agua Fria river, have been completed. Ten carloads of machinery for the plant have arrived at Mayer and as many more are on the way. The plant will have a capacity of 100 tons and will be utilized for the reduction of ores mined by the Copper Queen Gold and the Stoddard Mines companies. Eighty men are on the payroll, 25 of whom are millwrights.

Four thousand dollars' worth of gold bullion and a carload of high-grade concentrates is the monthly output from the Tiger Gold property in the Bradshaw mountains. Within a short time this is to be exceeded. The property, including the dump tonnage, is under lease to Bradshaw, Riggs, Cowan, Marks and Shea, all of whom are former operators of mines in the mining districts of Nevada.

Oatman.

Developments in the Ivanhoe property are the center of interest. At a distance of 395 ft. from the shaft, and after cutting through an intrusive dike of quartz-porphyr, the main vein which was the objective was entered. It has been penetrated a distance of 27 ft. beyond the foot wall, with no hanging wall in sight. The vein filling is quartz, with some calcite and adularia, considerably stained by limonite and highly oxidized. The vein matter shows free gold. This work is being done at 500 ft. depth. The property is about 2½ miles northwest of Tom Reed, and at a surface elevation and estimated geological elevation of some 250 ft. less than the Tom Reed.

Steady work continues in the Arizona Tom Reed, both in shaft sinking and in lateral work on the 400 level from the Pioneer shaft. It is estimated that the strike of the ore shoots being developed in the Pioneer carry them into the adjoining property. Keith & Keith of Boston control the Pioneer. On the 400 level the east drift is yielding some vein matter which is speckled with coarse gold, and this is being sacked as developed.

In the Big Jim property 15 men are at work, and drifts are being run in both directions in the vein on both the 400 and the 485 levels. The faces of the four drifts are said to be in ore averaging \$35, \$150, \$30 and \$100. The first two figures are for the drifts on the 400 level, which have been carried in further than the drifts on the deeper level.

In the Fessenden property the south crosscut on the 500 level has been carried out 210 ft. and has already cut two veins showing about 3 ft. each of low-grade ore. Stringers of quartz are now showing in the face of the cut and the operators believe they are near their main vein.

The Black Range is steadily drifting in ore on the 300 level. Values, however, are spotted, going to above \$30 for a few feet, and then dropping very low. Through E. McNeal & Co., a syndicate of Chicago capitalists are said to have secured control of this property and plan extensive development.

In the United Northern shaft 330 ft. calcite stringers giving big pan values in gold are showing, and for some little distance these stringers have been increasing in number and strength. The shaft will be continued to 500 ft.

The Iowa Mining Co., in the southern section, has

decided to use two drills in sinking operations. The plant consists of a 25-hp. hoist and a 350-ft. compressor driven by a 50-hp. engine. Officials of the company state that the company is already financed to carry out the development plans of Engineer Carl O. Lindberg.

The North Star shaft is 400 ft. deep and the formation is so changing that the management believes the shaft is dropping onto a blind lead. Quartz coming from the bottom of the shaft yields good gold pannings.

New York capital is to back the Oatman-Federal Mining Co., according to an official statement by the company, which states that a block of 400,000 shares of the treasury stock has been sold.

The Goldroad mine sent a bar of bullion valued at \$17,000 to the mint this week, this representing last week's cleanup.

John B. Cockrum, attorney for the New York Central lines, is president of the Oatman Empire Mining Co., with headquarters in Indianapolis, which company has just been organized to operate the Empire group. Pending the delivery of machinery, which has been ordered, work of sinking the shaft has been started.

Drifting operations on the 300 level of the Carter continue in a full face of ore which is said to be averaging between \$20 and \$30, with the higher values predominating.

In the Boundary Cone, drifting operations on the 750 level have not as yet reached the zone, where the downward continuation of the ore shoots opened on the 550 level are to be expected. The formation is satisfactory.

The Lucky Boy has completed its station on the 350 level, is overhauling its machinery equipment and within a couple of days will start driving a crosscut toward one of its veins, which is estimated to be about 75 ft. distant.

The Gold Ore continues to ship 30 tons per day to the Gold Road mill, the extraction being better than \$20. Development of new ore continues steadily.

The Gold Dust continues to block out mill-grade ore on the 2nd level, and on the 5th level lateral work is being done to find the downward extension of this ore shoot.

Although a number of companies which entered the Oatman district and commenced operations on a "shoe-string" are in financial straits, and some of these operators are sending out pessimistic reports, optimism among those who entered the field prepared to withstand a long development siege is higher than ever. Mining activity, backed by ample funds, is greater than at any previous time.

CALIFORNIA.

Keeler.

The Jumbo mine, south of Keeler, has been taken under bond and lease by the Darwin Development Co. Sixty tons of lead-silver ore are being shipped monthly, much of this being high grade. Extensive developments are proceeding at several points and reserves of shipping ore are being steadily augmented.

The Montezuma property in the Fish Springs section, owned by Louis Joseph of Big Pine, and John Mitchell, is on the eve of heavy production. Orders have been placed for motor trucks, and a large tonnage of high-grade ore is in the bins. Twelve men are blocking out ore.

Trainloads of ore are leaving Keeler daily and the railroad company is experiencing difficulty in handling the heavy tonnage. The heaviest shippers are the Cerro Gordo, Jumbo, Santa Rosa, Anton, Lucky Jim, Custer and Ygnacio. A number of smaller companies and numerous lessees are making occasional shipments of silver-lead and zinc ores.

The Estelle Co. has driven its tunnel under Buena Vista mountain a distance of 6850 ft. and expects to reach the objective ore bodies in about 500 ft. The bore, designated as the Troeger tunnel, is 7 ft. sq. Five distinct veins have been intersected, the ledges carrying silver, lead, copper, gold and zinc. A little further on it is expected the western extensions of the Union, Jefferson, Enterprise and Santa Maria veins will be encountered, at an approximate vertical

depth of 3000 ft. A drift will then be driven to the Ygnacio ledge. The holdings of the company embrace 500 acres. Preparations are being made to replace the steam power plant with an electrical unit. Roy C. Troeger is superintendent.

Kennett.

The Mammoth Copper Co. has decided on the immediate building of an electrolytic zinc plant at Kennett, to cost in the neighborhood of \$350,000. It will employ the electrolytic process developed by the Bully Hill Co. at Winthrop, after a series of experiments extending over several years. Metallurgists of the Mammoth Co. have thoroughly investigated the process and are convinced of its merits along commercial lines. As soon as the plant is in commission all the zinc produced by the Mammoth mines will be treated at this point and shipments to Kansas smelters discontinued. The plant will also treat the dust from the bag-house, which already contains 25,000 tons of material running high in zinc, with some silver, gold and copper.

It is reported here that the Bully Hill Co. will erect a large electrolytic plant near Winthrop to treat its own ores, and may also handle the output of the Afterthought mine near Ingot. The Bully Hill mine has been developed to a vertical depth of 1000 ft. and contains large reserves of copper-zinc ore. It is said the Afterthought owners would welcome the opportunity to ship to the proposed plant, provided satisfactory arrangements were made.

Coulterville.

New machinery has been installed at the McAlpine mine and drifting from the 500 level has begun to intersect a rich shoot which yielded large quantities of ore in the upper workings. In the older sections of the property some developments are advancing with satisfactory results. W. A. Irwin is superintendent.

Colfax.

With the aid of a deep-sea diving outfit H. M. Estee is recovering gold from the North fork of the American river near here. The sand and gravel at the bottom of the deep stream contains considerable gold, particularly in the deep depressions, but attempts to win the metal by ordinary means have been fruitless. Other miners are watching the work with keen interest and it is probable this form of mining will become popular in the Colfax district.

Grass Valley.

The Pacific Western Commercial Co. is building a 900-ft. tramway from the Golden Gate mine and mill to the local railway line, and is preparing to crush chrome and tungsten ores, which will be shipped to the 30-ton Golden Gate mill. It is reported the mill will be remodeled for production of tungsten concentrates. It is also likely that work will be resumed in the Golden Gate mine, which produced good ore years ago.

The cyanide plant at the Golden Center mine has been practically completed and enlargement of the main plant is proceeding rapidly. Work in the deep levels from the new vertical shaft continues to uncover quartz of good milling grade. The company is installing hoisting and pumping equipment at the Allison Ranch mine and expects to have the property in shape for mining before the end of the summer.

Eureka.

The Humboldt Copper Co. is exploring its extensive acreage with diamond drills. Immense tonnages of low-grade material were discovered last fall and the present work is going on with a view to intersecting ore of better grade. O. H. Hershey is consulting engineer.

A thorough examination of the 74 claims of the Horse Mountain Copper Co. is being made by engineers representing Eureka stockholders and Charles Willis Ward, New York, who is heavily interested. It is planned to extensively prospect the more promising sections with diamond drills.

Redding.

High-grade copper ore has been discovered 14 miles west of Gibson in the Trinity mountains. The deposit has been proven for a length of 400 ft. and width of 300 ft. and is said to sample over 20%. Three carloads are ready for shipment, and developments are proceeding steadily to de-

termine the extent of the deposit. The property was discovered a few weeks ago and is owned by Dr. Ernest Dozier of Redding and Dr. J. P. Sandholdt and associates of Kennett.

Sutter Creek.

It is reported that all the ground between the Keystone and Golden Eagle properties, including the South Keystone and South Spring Hill mines, has been taken under option by a syndicate of Seattle capitalists. The group includes several noted mines, with large bodies of ore in their workings. Most of the properties have long lain idle.

Under the direction of Supt. Jose much new work is about to start at the Central Eureka. From the 3200 level a winze will be sunk to 3300 ft. with a view to picking up the vein which yielded well above the 3000. A series of drifts will be driven to intersect new ledges believed to exist in both the hanging and foot walls.

COLORADO.

Cripple Creek.

The Cripple Creek Gold Mining Co. has succeeded in putting its Koyneho shaft down 440 ft. There has been opened what is believed the southern extension of the Strong vein dipping into the shaft. The vein fills the bottom of the shaft. The quartz is identical in appearance with the Strong ore. No lateral work on the vein, however, will be attempted at this time. Sinking is to be continued, and with a depth of 500 ft. attained, connection by lateral will be made with the Jefferson shaft workings, under agreement entered into between the Koyneho manager and M. B. Burke of the Jefferson Mining Co. This connection will ensure ventilation for both properties, and the additional exit will make conditions safer.

A new 1600-ft. air line has been constructed to the mines of the Albert Beacon Gold Mining Co. and hand drilling has been replaced with machine drills under the direction of General Manager Frank Vetter. A short extension has also been carried to the Henry von Phul lease on the property. In addition the compressor plant at the Iland tunnel is to be connected up on the Eureka claim of the Prince Albert group. This lease has a rich ore shoot under development from a winze sunk below the tunnel level, and with power drills would make a material increase in production.

The Reid and Worcester mills, recently constructed and placed in commission at the Dante and Rubie mines, are running steadily, and while no cleanup will be made for another week, tests of the concentrates show both to be successfully treating low grade ores. The Blue Flag, Neville, Wild Horse and Isabella mills still remain inactive, but two or more of these plans will be running again very shortly, it is rumored.

A second shipment has been loaded out from the Shoo Fly property. Recent exposures have been richer, and rusty gold is visible on the face and cleavages of the quartz. Panned, a long string of coarse colors results in each panning. Grab samples taken back of the machine are running from 1 to 5 ozs. From the ore in sight bi-weekly shipments can be made and 2 cars will be loaded out during the present week.

At the Hondo property, an ore body, having the appearance of permanency, has been entered at the 500 level in Sitting Bull shaft. Grab samples taken across a 4½-ft. face of the vein, give returns of \$19 a ton. Streak assays—the vein is seamed with narrow but rich streaks of ore—run high. The vein, on which this shoot has been entered, is shown on the maps as the extension of the Harrison vein of the Golden Cycle system. The course of the vein is identical with the Harrison-Cycle lode, striking northwest, while the vein matter is colored with fluorite and carries both native gold and calaverite and occasionally a little pyrite and galena. The ore is now going into the bins and a shipment will shortly be made.

El Paso Con. Gold Mining Co. has liquidated its indebtedness. On Jan. 1, 1916, it was reported at \$29,000. To date the company has paid about \$2,000,000 in dividends

from a production of \$9,000,000. The company now has 15 sets of lessees active and producing and the June production, based on the output to date, will be about 75 to 80 cars, or approximately 2100 tons, with an average value of 1 oz. gold. The company will receive a good sum in royalties from this ore, lessees having mined the bulk. It is continuing exploitation work in the deeper levels, and at this time has 3 machine drills in operation on dead work.

Leadville.

The News gives a review of this district as being more active now than in some time past. The United States Smelting, Refining & Mining Co. has practically unwatered the properties on Friar Hill which it intends to work, and within a short time sinking will be started to open up the ore bodies at greater depth. At Kokomo and Robinson many of the old mines that have not been worked in years are being opened up. In the old days this part of Colorado saw many properties flourish for a few years and then practically pass away. When the price of the white metal went below \$1 in the early eighties these properties ceased work. At these old mines are mills, smelters and dumps. At Breckenridge the Dunkin mine is shipping gold ore that goes to the mint at Denver just as it is taken from the grounds. Besides that the company is shipping a good lead-silver product. The Tonopah Placers Co., a subsidiary of the Tonopah Mining Co., is taking out \$5000 a day from the placer ground about Breckenridge and there are still thousands of acres of placer ground to be treated. One of the four dredges in operation is handling \$2000 in gold a day at a cost of approximately \$120 a day. Drilling operations are also adding to the territory the company already has. The Rilla Mining Co. is now well equipped with drills, and other machinery for rapid development. Running through the property from east to west is the Witch Hazel vein, which has produced considerable ore in other properties. To the north of this is mountain of gneiss. From the base of this mountain a tunnel is being driven to get depth on the vein. In the gneiss rich, narrow streaks of ore are being found in the cross fissures to the Witch Hazel. T. R. Griffith, manager of the property, who has been in the district for many years, feels confident that when the tunnel reaches the vein, large ore bodies will be found in or near the Witch Hazel fissure. The latest development at this property is that the main tunnel, which is now in 1200 ft., is showing softer in the face and considerable water is coming in. It is expected that the fissure will be encountered within 100 ft. Another more recent development is the opening of a porphyry ore body for a distance of 1000 ft. and 18 ft. wide which carries from \$3.60 to \$4.20 and as high as \$8 a ton in gold and silver and an average of 60% copper. In this body there are 250,000 tons of ore which it is believed will make net returns of better than \$1.50 a ton. The old Governor mine, which has not been active for years, has within past few days started work. The property has been tied up in litigation and a settlement has just been effected. There is a large dump on the ground carrying \$10 a ton. During the time that mine was tied up in the courts much of the ore from the dump was hauled away and made into wagon roads.

IDAHO.

Wallace.

At a meeting of the shareholders of the Nipsic Mining Co., June 24, the sale of the company's property to the Consolidated Interstate-Callahan Mining Co. for \$111,200 was unanimously confirmed. The sale had previously been negotiated, subject to ratification by the shareholders, at a meeting of directors, held June 16, the directors in question being J. W. and Edward Pohlman, M. Freeland, E. V. Sandell, W. G. Boland and J. F. Dealy of Spokane and Norman Ebbley of Wallace. At the shareholders' meeting J. V. and Edward Pohlman voted 1,210,253 shares of the Nipsic's issued capital stock of 1,344,851 shares, or approximately 90%. "After taking care of the outstanding obligations the net returns to the shareholders will be between 7 and 8 cts. a share," said J. V. Pohlman, president of the Nipsic. "We

bought nearly all of our holdings, or more than 1,000,000 shares of Nipsic stock, in the open market at prices between 6 and 7 cts. The Nipsic property consists of a group of seven claims lying northwest of the Hercules and north of the Interstate-Callahan group, which it partially adjoins. The Silver State group lies between it and the main body of the Interstate-Callahan holdings.

Fritz Marschante of Spokane has bid in for \$10,100 at receiver's sale the claims constituting the old Oro Fino group prior to its consolidation with the Bear Top property as the Bear Top-Oro Fino Co. The sale was conducted at the mine by Allen G. Kennedy, receiver, and will have to be confirmed by the district court of Shoshone county to become effective.

Stock of the Con. Interstate-Callahan Mining Co. was listed on the New York stock exchange June 29. It will be necessary for shareholders to send their stock to the company's transfer agent, the Title Guarantee & Trust Co., No. 176 Broadway, New York, for transfer into engraved certificates approved by the exchange before any trading in the issue will be permitted. New certificates will be returned at once.

The listing of the company on the New York exchange marks another chapter in the career of the corporation, and also creates a broader market for one of the sterling Coeur d'Alene stocks. Less than 3 years ago the shares were inactive at from \$3.75 to \$5, but in recent weeks the price has advanced to from \$27.50 to \$29, and the demand, both locally and in the east, has been insistent. Regardless of the increase in price, however, but little of the issue has been lured into the open, the majority of the holders preferring to retain their holdings as a permanent investment.

Kellogg.

The Constitution Mining & Milling Co., of which Judge George Turner of Spokane is president, has decided to build a mill on its property, the Constitution group, near here. The plant will be of 100 tons daily capacity and will cost between \$30,000 and \$35,000. The Constitution ore is a complex lead-silver-zinc, and for the last 3 months the management has been making exhaustive tests to determine the best treatment. A mill-site has been selected about 1000 ft. from the main workings, at a point where adequate water can be secured from Pine creek and a small tributary stream.

Hailey.

The Federal Mining & Smelting Co., which recently acquired the North Star-Triumph mines, has begun the erection of a 300-ton concentrator at the property, according to Frederick Burbidge, general manager for the Federal Co. The plant will be equipped with a flotation system and electric separator, and is being designed and fitted especially for treatment of the North Star-Triumph ores. Burbidge states also that the mill at the Federal Co.'s Morning mine at Mullan is being enlarged, and that as soon as the additional equipment is ready for service the output of the mine will be increased.

LAKE SUPERIOR.

COPPER.

Houghton.

Franklin has finished lining the collar of the Allouez conglomerate shaft No. 2 with reinforced concrete and will in a very short time put up the steel head frame. Later on a shaft rock house will be erected. This southern side of the shaft is all in good ground with many long stretches of spectacular disclosures; the 32nd level is now over 1100 ft. from the crosscut leading from the shaft, which is, of course, on the Pewabic amygdaloid 500 ft. west of the conglomerate. Within less than 300 ft. of this conglomerate No. 2 shaft, and the 27th level are only a few feet behind with several other levels half way or more along in the same direction. Only a very small portion of the tonnage is coming from the amygdaloid, it having slowly but steadily decreased, so that the additional amount on this account coming from the conglomerate with the constant if slow increase

of the total tonnage, and the fact that all of the rock from the conglomerate is from this good ground on the southern side, the yield is showing a constant improvement. The tonnage has increased as often as the drifts are sufficiently opened for new stopes. Besides the increase here there will soon be another with a similar steady rise, from No. 2 and with these increases will come lower costs.

Cherokee has its hoist in position and is advancing so well with its buildings that in about 10 days it will commence mining operations, which will be to sink the exploration shaft, which is down about 16 ft., farther on the lode. The shaft is located where the lode was trenched with a disclosure of a width of 46 ft. and very heavy copper over the greater part of it.

New Arcadian has a width of 700 ft. on both its drifts on the 900 level with an average somewhat better than that of the other openings. This is very positive evidence in favor of the continuation of the mineralization both on the length and depth of the lode; it is also the greatest length of drifts made on any level so far.

Michigan is still continuing its wonderful showing on the Butler lode, the best disclosures so far being now made. The richest display is being made on the west side of the shaft, where the lode was cut into about 8 ft. from the drift carried along the course of two stringers in a fissure or "crossing" that has shown a width of 14 ft. and which is being opened by drifts as it is richer than the surrounding vein. This territory has been very greatly broken up and the fissures resulting have no uniform course as is usually the case. The amount of stamp copper is very small. Supt. S. A. Brady, who has been at this mine for a long period, and has made a long study of the lodes of this region, says the disclosure of copper is very remarkable for its richness and its occurrence in these veins.

LaSalle is shipping to the Franklin mill nearly 500 tons daily, and could ship more if there were greater milling capacity to be had. The best ground is at No. 2, the southern shaft, which has been recently sunk to the 9th level, and which has been good beginning with the 12th level. No. 1 is bottomed at the 20th level, but is only unwatered to the 15th and is only being stoped as far down as the 13th level. The rock here is hard and the stamp shoes only last about 3 days, while at the Centennial they last 5, and at the Allouez 7. The amygdaloid here is almost as hard as the Calumet conglomerate, where the stamps last only about 2 days. There is a chance of finding as good ground at depth and laterally at No. 1 as at No. 2. The electric pump located at No. 2 drains both shafts from the 12th level is a great success both as to efficiency and as a cost saver.

Centennial has extended some of its drifts out under the South Kearsarge and Wolverine to the North Kearsarge line, and at this point is about the distance of one-half the greatest width of the Wolverine from its east corner. The average of the ground passed through is very good. This part of mine will be taken out from No. 1 Centennial when in 2 to 3 years South Kearsarge will have exhausted its paying rock. The shipments remain at about the same figure as for some time past, about 550 tons.

Calumet & Hecla has continued the 10% premium on monthly earnings, now being paid, until Jan. 1, and will also pay to each person in its employ Dec. 31, 25 cts. per day between July 1 and that date. This payment will be made in January, 1917. These provisions apply to the Ahmeek, Tamarack, Calumet & Hecla, Allouez, Centennial, White Pine, Isle Royale, Osceola, LaSalle and Superior, and will embrace about 11,000 employes.

Osceola will have about 112,000 tons for June as compared with 114,000 for May, the former having 26 working days and the latter 27, the difference being partly due to the scarcity of men. The two South Kearsarge shafts will last about the same time, for, though No. 2, the Southern, has the lesser amount of good ground, its shaft pillars will be taken, while those of No. 1 will be retained so that the shaft can be used for hoisting the northwestern side of Centennial. The greater part of the present tonnage of South Kearsarge is coming from the footwall, which was discovered to have a greater extent of copper a few years

ago, though there is considerable of the rich streak of the hanging wall being also mined. North Kearsarge has just begun with a small tonnage by the resumption of mining at No. 3 to gradually supply the declining tonnage of South Kearsarge. Old Osceola is in the ground that has been found to be much richer than the rest of the mine, on the 38th to the 13d levels inclusive, these having been carried the farthest to the south; and the ground will be undoubtedly found to be equally rich, when the lower levels are sufficiently extended. As there is yet on the southern side of the mine quite a large area to be mined, this means much in the way of "sweetening" the yield, as has been done during the greater part of the past year. The mining costs for this good area have been much reduced by the introduction of the compressed air and rope haulage on the 42nd and 45th levels.

Winona is hoisting from King Philip shaft No. 1 a small amount of rock which will be increased as men can be obtained.

Ahmeek is having constructed by the Westinghouse Mfg. Co. turbine of 1000 kw. to run the lights, rockhouse machinery, pumping to its reservoir for the boilers at Nos. 3 and 4, etc., which will afford a much more convenient and a cheaper power. The Worden-Allen Steel Co. has begun to erect the steel shaft rockhouse.

Quincy is getting about 150 tons a day from No. 7 shaft from rock left in the main branch of the Pewabic, or Quincy, lode, and will, when that is exhausted, which will take some time, begin to open up the west branch that has shown such good values at No. 2.

Tamarack is, at shaft No. 3, in about 2600 ft. on the 20th level, which is on the subsidiary shaft begun from the 18th level, towards No. 5, having only about 400 ft. more to go, and the rock is averaging almost as good as when first opened by the sinking of the shaft at this level. It is richer on the 22nd level where a drift has pushed quite a distance both ways, and also on the 23d where a loading station is being cut out, than at any place on the subsidiary shaft. This betterment of the yield with depth is quite marked. The temporary injunction asked for by G. A. Hyams to restrain sale of Tamarack stock because Calumet & Hecla had voted their own stock in the vote of the company for the sale, was denied by Judge Sessions at Grand Rapids, June 27, on condition that if sale be made to the Calumet & Hecla Co. no distribution shall be made to Tamarack stockholders for 15 days after sale, and notice thereof to plaintiff and that of moneys received, the Tamarack shall keep in its possession within the jurisdiction of the court and subject to its order \$100 for each share owned by the plaintiff or other stockholders who may within said 15 days intervene, such moneys to be retained to secure payment of any decree hereafter made in favor of plaintiff and intervenors. An appeal was made by Hyams June 28.

IRON.

Iron River.

Sinking at the Spies mine here will be continued. It is being operated by the Cleveland-Cliffs Co., and will not be in condition to ship until the 1917 season. The original intention was to start in on ore at the 130-ft. level where a drift 150 ft. had been extended, but now they are going down 450 ft., opening the mine at several levels before starting stoping.

Ishpeming.

The Holmes shaft was down 475 ft. July 1, it having been sent down at better than 100 ft. per month since the work began. The shaft is to go to the 1200 level. During the week a pair of 10-ft. hoisting drums were received, with 7-ft. faces. Other machinery as well as structural steel is being received, and the buildings are in course of construction.

The Cleveland-Cliffs Iron Co. has let a contract to the Hoose & Person Construction Co. for shipping the stockpile ground and grade for the railroad tracks at the new Holmes mine. Permanent tracks will be put in, connecting with the different railroads, both on the north and south sides, so that the ore trains can be handled to the best of

advantage. The stripping is extensive, and the company expects to keep their force busy there for 2 months. In places the cut into the embankment will be 20 to 30 ft. Many bowlders, too large to be handled by the steam shovel, are being encountered, but these will be blasted and dumped into the foundation being made for the stock-pile grounds. Forty men are now being employed on this work.

Republic.

An excessive amount of water is being encountered at the Republic mine. There is plenty of water power, however, for the hydroelectric plant. Formerly the water was pumped during the night shift, but now it requires steady pumping throughout the day, this being due to the excessive rains of the last few weeks. The single trestle stands are working out satisfactorily and they were particularly useful during the time the L. S. & I. was out of commission and not handling ore, in permitting stocking at the shaft. As the trestle supports were still in place the ore was dumped onto the pile, which would not have been done had the old two-legged stands been in use, as they would have been removed in the steam shovel work of loading onto the cars.

MISSOURI-KANSAS.

Joplin, Mo.

The lower prices paid for zinc ores the last month resulted in a further reduction in the wage schedule of 2½ cts. a day, and while it caused considerable dissatisfaction, most of the miners acceded with good grace. Those dissatisfied were principally shovelers, who departed for the harvest fields and left a number of the mines rather short handed for this class of labor. The general results are reductions in output, a feature in line with the present needs and desires of the majority of the operators of the field.

In fact, this week sees a general threat of shutdown in the sheet ground field, where the cost of production is always high, and where the low-grade ore makes a small margin of profit. Driven by low ore prices very near the profit extinction mark, and then having to face higher prices for dynamite, has forced a crisis among that class of mines whose mining costs are high, and whose profit margin is small. Many of this class of mines will not be operating after this month unless the price of ore goes up again, or else the price of supplies and labor go down very greatly.

Never in the history of the Joplin district has there been the amount of surplus stocks of ore now existing in the ore bins of the district. It is conservatively estimated that at least 25,000 tons of zinc concentrates are now in the field ready for shipment, and with a constantly receding market, it has been growing every week. Any shut downs or curtailment of output is looked upon with favor by those who are desirous of seeing a maintenance of the ore market levels that have been enjoyed for many months.

The final organization proceedings were perfected last week for the Interstate Mine Operators' Association, to embrace zinc and lead mine operators of Missouri, Kansas, Oklahoma and Arkansas. The officers selected so far are the president, P. D. Butler, and Henry Connolley, secretary. A directorate and executive committee is now being selected, which will practically control and direct the organization. The work of the new organization will be toward the better marketing of the ores, better buying of their supplies, and organized action with regard to all community problems affecting the mining industry. The membership is strictly limited to those whose interests are mining as opposed to smelting, and no other members will be tolerated. It is said the organization will start out with a membership of about 300 operators.

The mid-year showing in output is a remarkable one from both tonnage and value. In tonnage there has been a very large increase in the zinc output as compared with 1915, and the valuation has nearly doubled that of the same period last year. The total is approximately \$20,000,000 for all ores as against slightly over \$10,000,000 the first half of 1915. The high-price period of the months of March, April and May, together with the large shipments made at that

time, very materially aided in increasing of both shipment and value.

That the mining companies of the Joplin district will aid in the national preparedness movement is made manifest in the announcement by some of the larger concerns that any of their employes called out by the militia will have their jobs held until their return, and during their absence will have paid to their dependents a salary of \$50 per month. The first of the concerns to make the announcement was the Kenefick Zinc Corporation, which has been followed by others. The calling out of the Missouri militia resulted in calling out of the Joplin district four different companies, one from Webb City, one from Joplin, one from Carthage and one from Sarcoux, while the one at Pierce City also took some of the workmen from the field. Over 600 men were drawn from the district and took its toll from the mine employes, a toll that was felt severely in some quarters.

Miami, Okla.

The United States Smelting Co. is rapidly developing its new lease in the Cardin camp north of Miami. It acquired by purchase from B. H. M. Marbury a prospected piece of ground lying between the Blue Goose and Beaver mines, consisting of 40 acres; 18 drill holes were down, showing the ore deposit, and the purchase price was stated to be \$125,000. The company is now sinking two shafts and is at the same time moving its mill from the old Ravenswood mine at Reeds and getting it ready for erection on the new lease. There are approximately 18 cars of machinery already shipped to the new site and more are to follow. The foundations are in for the air compressors and the boiler plant is being bricked in. Everything will be ready by the time shaft sinking is completed. T. J. Rightly is the local superintendent of the company.

MONTANA.

Butte..

The North Butte Mining Co. has advanced the quarterly dividend from 50 to 75 cts. per share. This puts the company on a basis of \$3 per share per year as against \$2 formerly. The last payment of 50 cts. was paid April 26. The dividend of 75 cts. will be paid about July 26. The requirements for dividend purposes on the 130,000 outstanding shares will be \$322,500. The company is making on the present basis of production and price of copper from \$6 to \$8 per share above all expenses. The stock is selling at the lowest point for many months—\$21.50 to \$22—and the new dividend rate of \$3 would be about 11% on the investment.

The Tuolumne is now shipping 50 tons of ore daily. In order to secure better air on the lower levels, a raise is being driven from the 2600 to the 2100 levels. When this work is completed a winze will be sunk from the 2600 level and if developments are favorable, then a shaft will probably be sunk to the 2800 level. The 2600 level is the same as the 2800 of the North Butte, and so it means, if Tuolumne's management should decide to sink deeper, that the new lower levels would open up the Jesse vein at a lower depth than has yet been done in the district.

At the Butte-Main Range property the Tuolumne management, in accordance with its contract, is retimbering the 700 ft. of shaft preparatory to developing the property. The Tuolumne will start its development work of the Colusa Leonard Extension in the near future. The contract between the Tuolumne and Colusa Leonard Extension companies will be ratified at a stockholders' meeting in Phoenix. In the meantime necessary material is being hauled to the Colusa Leonard ground.

Alfred G. White, mine economist for the U. S. Bureau of Mines, is in Butte to begin a survey of the production and consumption of coal, oil and electrical supply throughout the state for future calculation by the commercial interests of the country and the government. The work in Montana is part of a compilation of these products throughout the western states which Mr. White has been engaged in for the last 3 years. He is studying the distribution of coal from the

different fields, the extent of such distribution and the manner of consumption. In studying the coal fields he will endeavor to find out the tonnage used by the railroads, the amount sent out of the state and the number of tons consumed for domestic and commercial purposes. The statistics collected will be grouped according to fields, then states and totals for the western part of the country. His study of oil and electrical development will be very largely relative, and from the point of view of their ability to displace fuel where power, heat and light are generated or to supplement the coal supply.

Two stations—65x20 ft. each—have been cut out at the 1600 level of the Butte & London, and crosscutting will be pushed. As recently announced the two crosscuts will be run north and south to open some 20 veins striking easterly from the Anaconda hill. The crosscuts will be 1250 ft. each in length, which will extend them to the property's end lines, as called for in the contract. Considerable interest is evinced in the development of this property. Under present plans the work of crosscutting will require about a year.

The Anaconda Copper Mining Co. at a recent meeting of the directors decided to increase its regular quarterly dividend from \$1.50 to \$2 a share. It has been predicted that the Anaconda will earn \$15,000,000 this year and while the company still has some debts to meet it is believed this can be done even though the dividend is increased.

In June 1 the East Butte Co. had \$1,900,000 in cash on hand and with the earnings for June added had a surplus of about \$1,200,000 on July 1. This is the best financial condition of the country in its history. The production of copper is now in excess of 1,500,000 lbs. per month, and as long as copper keeps around the level of 27 and 28 cts. the company will continue to add to its surplus about \$200,000 a month. There is nearly \$3 per share in cash in the treasury and the company is making about \$6 per year per share.

NEVADA.

Tonopah.

A new ore body, 5 ft. wide, has been encountered on the 1260 level of the Tonopah Extension. It was found between the O. K. and North Merger veins while extending crosscut 403 and is of excellent grade. It is being developed and promises to closely resemble the O. K. ledge, which is a connecting vein between the Murray and North Merger ore bodies. Retimbering of the Victor shaft is being rapidly completed and a heavy tonnage will soon be drawn from the deepest workings. The mill is now treating 2200 tons of ore per week.

The Belmont mill is crushing about 3000 tons of ore weekly, and developments on all the main levels continue gratifying.

The output of the Tonopah district has increased to over 9000 tons per week. The Rescue Eula has increased its production to 210 tons weekly, and the yield of the Halifax now exceeds 158 tons per week. Tonopah Mining is producing 2000 tons; West End, 708 tons; Jim Butler, 750 tons; North Star, 43 tons. Lessees are shipping 25 to 200 tons per week, most of this coming from blocks on the Midway and Montana.

Hawthorne.

The Mineral County Gold Mining & Cyaniding Co. has been formed, with J. H. Miller, president and general manager; P. H. O'Neil, vice-president; J. E. Adams, secretary-treasurer. The Harvey-Taylor group of 5 gold claims in the Bell district has been acquired and will be worked. Considerable ore is exposed. The property is equipped with a cyanide plant.

The Nevada Garfield, a property with a productive record of fully \$3,000,000 in silver, has been taken under option by H. B. Lind of Goldfield and T. K. Stallo of New York. The dumps are estimated to contain ore to the value of \$2,000,000, and large quantities of low-grade material is exposed underground. The property is being placed in shape for a thorough sampling and satisfactory reports by

the examining engineers will result in the acquisition of the group by a strongly-financed New York corporation.

Rye Patch.

B. A. Goldsworthy and associates have bonded and optioned the Redemption mine from J. O. Blackburn for a price of \$25,000. The property adjoins the old Rye Patch mine, and contains some good-grade ore. Sinking on a 2-ft. vein of excellent ore is proceeding and the best-grade product will be shipped. Later on a mill may be erected.

Golconda.

Ore ranging from \$45 to \$300 in lead, gold and silver is being shipped to Utah smelters from the Honolulu mine, 12 miles south of the Golconda. The shoot is 18 ins. wide and consists entirely of a hard carbonate. The mine comprises 6 claims, adjoining the Golconda, a once famous producer. J. A. Gomes and associates of Golconda are the owners.

Mina.

The Blue Light Mining Co. is arranging to install a leaching plant of a capacity of 100 tons. Shipments have been discontinued and all ore in future will be treated at the company's plant. It is stated a good tonnage of excellent grade copper ore is blocked out. F. M. Baker of Carson City is manager.

Goldfield.

Work has been resumed at the Lone Star with Emory Arnold in charge. Drifting from the -225 level of the Nelligan shaft is proceeding with two shifts to open the extension of the Patrick vein. Arrangements have been made to install an electric hoist and a large compressor. Control of the company was recently gained by New York capitalists.

Connections have been established between the Merger and Jumbo Extension mines and prospecting of the shale-latite contact by the Merger Co. is being pressed. Most of the work thus far has been in shale with the contact tapped by a few raises. Exploration of the true contact is now advancing. This work will determine whether or not the rich Jumbo Extension vein passes into Merger ground.

NEW MEXICO.

Mogollon.

Mogollon Mines Co.'s cleanup for last 2 weeks produced 14 bars gold and silver bullion and 8 tons high-grade concentrates. Ore treated the past week was 875 tons. The new 3-compartment shaft is now 40 ft. below the 700 level and is being sunk at rate of 2 ft. a day; it is in commission for regular hoisting from the 500 level. This property is under the management of S. J. Kidder.

Socorro Mining & Milling Co. is constructing a conveyor to dispose of tailings by elevating and fluming onto a comparatively flat area near the mill and avoid discharging into creek, which has caused more or less inconvenience to ranchers in the lower valleys in past years. The plant treats 230 tons of ore daily.

The Oaks Co. has encountered pay ore from north drift of raise in south tunnel on Eberle mine and is shipping to custom mill. Ore body No. 1 in Clifton mine has been proven to continue to the north by a new crosscut into foot wall of adit tunnel.

Surveys and measurements by Earl C. Cleaveland the past 2 years on West Fork creek have demonstrated the availability of a minimum of 1000 to 1500 hp. during the dry seasons. For its magnitude this is probably the most feasible of the unappropriated water rights within a radius of 35 miles, and if developed will supply the greater part of local power requirements. The mines for a number of years have used crude oil, freighted about 90 miles by wagon, as a source of power, at a cost of around \$150 per horsepower-year. The rising price of crude is turning their attention to the possibilities of water power development which will generate current at a fraction of the present cost by internal combustion engines. It is understood the operators will contract for power at \$100 per horsepower-year with any outside interests undertaking the installation.

NEW YORK.

Gouverneur.

The Northern Ore Co. has increased the capacity of its concentrator at Edwards to 200 tons of ore per day. A car a day of high-grade concentrates are going out. The company has just opened its new hotel, the Northern Inn, to the public.

The Lux Development Co. of Syracuse has resumed development work on the Horace Webb farm, where several test pits were sunk last summer. A steam hoist has been installed.

The Grenville Reduction Co. has been organized by Gouverneur business men for the purpose of erecting a custom concentrator, for which there is a large demand. Charles McCarty, ex-postmaster, is president; John J. Sullivan, president of the Chamber of Commerce, is vice-president, and Arthur W. Orvis, a prominent attorney, secretary and treasurer. The other directors are Mial H. Pierce, W. S. Lee, Jerome Payne and Dr. G. H. Summerfelt. The company is capitalized at \$100,000. In addition to a concentrator a zinc white plant may be installed.

The Pre-Cambrian Exploration Co. has filed incorporation papers. The company is capitalized at \$50,000 and has taken an option on the Eugene Davis property, 1 mile from Talville, on which a vein carrying high-grade milling zinc ore on the surface was recently discovered. The vein has been stripped and shows a width of 57 ft. Selected samples assay 25% zinc and the ore is practically free from pyrites. The company organized by the election of B. J. Hatmaker, mining engineer, president; E. C. Jordan, chemist, vice-president, and A. W. Orvis, secretary and treasurer.

OREGON.

Champion.

The Champion Con. Mining Co., capitalized for 3,000,000 shares at 10 cts. each, has been organized by Olaus Jeldness of Spokane and associates to take over and operate three groups of claims in the Bohemia district, at a reported price of \$500,000. Mr. Jeldness is president, J. S. Lewis, vice-president and treasurer; C. V. Bobb, managing director, and H. C. Mahon, Portland, secretary. "The properties acquired by the Champion Co. have been examined by Jeldness and myself," said Bobb, "having been favorably passed on previously by several engineers, including W. W. Elmer, R. H. Spencer, W. H. Adams and James P. Kimbell, late director of the United States mint. They consist of 49 claims formerly embraced in the holdings of the Helena, Music and Champion companies covering 800 acres and three parallel ledges for more than a mile along their strike. They form a compact group, located at Champion, 35 miles from Cottage Grove, on the line of the Southern Pacific railroad in Lane county. The mines were discovered in 1858 and the district was named in 1863. The Champion is more extensively developed than either of its neighbors and contains 2000 ft. of crosscuts and drifts. All three groups are stope, so far as they have been developed, to the 300 level, where the ore changed in character from free milling to refractory. Considerable virgin ground is left above the 300 level. The gross production of the three mines to date is estimated to have been \$2,200,000, of which one-half was taken out by the Champion. All three ledges average about 3 ft. in width and show strongly in the bottom of all drifts. Champion ore, according to old mill records, averaged about \$80 in gold. We are drifting east now on the 300 level in new ground in a body of ore that averages \$50. By driving a crosscut 40 ft. in the Music mine we expect to open a large reserve of \$40 ore above the 300 level. The property is equipped with machinery valued at \$200,000, all of which is in first-class condition. We propose to increase the capacity of the 30-stamp mill and concentrator by the addition of 20 stamps and a flotation mill, with which we shall be able to treat economically the ore the old-time miners found too

refractory to handle. Among the machinery equipment is a hydro-electric power plant developing 800-hp. and a saw-mill. The company's holdings include 60,000,000 ft. of Oregon fir. Two ore resources which we expect to be the base of large production are a shoot of ore 25 ft. wide, developed for 400 ft. in the Excelsior vein of the Champion showing average values of \$3 to \$4 a ton; and an unexplored porphyry dike 150 ft. wide from which numerous samples taken by Jeldness and myself ranged from \$1.60 to \$3.50 in gold."

SOUTH DAKOTA.

Lead.

Articles of incorporation have been filed by the Johnson Fuel Co. of Fairfax. The corporation is capitalized at \$2,000,000. The company has holdings of 10,000 acres on which there are large deposits of low-grade lignite coal, and will install machinery to briquet the material. Tests made in the Fernholtz briquetting machines give very favorable results and the product can be mined, briquetted and sold for less than \$4 per ton. It is expected that a six unit plant having a daily capacity of 440 tons briquets will be installed this year.

The Custer Peake Copper Co. is installing a new boiler, compressor and pumps, and as soon as they are put into commission the 250-ft. shaft will be unwatered, and the active development of the copper deposits will follow. This property has been idle for a number of years.

The Wasp No. 2 will return to the mining and treatment of gold ores within a very short time. Operations were suspended some months ago when the large amount of water in the workings made the work impractical. Tungsten ores are being mined and concentrated, and since the closing down of the gold mill about 50 tons of high-grade material has been recovered. The recent installation of a jig to eliminate hand sorting has proved a great success, both in costs and in the grade of material produced.

The Homestake has completed the tungsten concentrator and is now treating the lower grade ore. A good product is obtained and regular shipments of concentrates and high-grade mine ore are made.

Terry.

The aerial tram at the Two Johns property has been put into operation, and the ore from the mine is now delivered to the railroad, a distance of 4000 ft. The mine is under lease to W. A. Hines and associates and the ore is shipped to the Mogul mill for treatment.

C. B. Harris has begun work on the War Eagle property and is taking out lead-silver ore for shipment to a smelter. The first car is ready and regular shipments will follow.

Deadwood.

The U. S. Gypsum Co., whose plaster mill was destroyed by fire last fall, has for some time been busy prospecting the gypsum deposits near Piedmont, and it is expected that a new plant will be erected at this place.

Water has interfered with the shaft work at the Homelode property, near Silver City, awaiting the arrival of a second pump. This has been placed in operation and the shaft has gained a depth of 75 ft. It is the intention of the company to continue to 100 ft. and then do considerable lateral work.

UTAH.

Delta.

The King Silver-Copper Mining Co. has been incorporated with a capital of \$100,000, divided into 1,000,000 shares of 10 cts. par value. The officers of the company are: Geo. E. Banks, president; Wm. F. Curtis, vice-president; Geo. Day, secretary-treasurer; Bert F. Johnson, general manager; H. P. King, superintendent of mines; Wm. C. Curtis, assistant superintendent of mines. It has 14 claims, a shaft down about 165 ft. near the south end of the property and

a tunnel in about 350 ft. near the north end. There are many prospect holes down 15 to 20 ft. in different parts of the claims. The principal values are in silver, copper and lead, with some gold. Recent samples gave the following returns in values: \$245.66, \$27.10, \$51.62, \$15.10, \$60.71 and \$94.86. These were samples taken from the dumps, among which they sent two sacks of 286 lbs. and received the values of \$51.62. The south end of the property seems to be the richer, where the croppings show a vein of copper and silver ore about 15 ins. wide. The north end has a vein about 6 ft. wide of silver and lead ore that assayed \$60.71.

Bingham.

A loading record has recently been made by the Utah Copper Co. which in 24 hours loaded 41,800 tons of ore. June will show a new record, both in production for the company and amount of ore handled. The month will show an average of 34,000 tons of ore a day, while the best previous record was around 30,000 tons a day. The best previous record made by the property was 16,000,000 lbs. for a month, while the production for June is expected to be over this. Although no figures have been given out it is probable that the production will be better than 17,000,000 lbs. After going into the details of the future D. C. Jackling, vice-president, sanctioned plans that call for the increasing of the present Arthur and Magna plants to a point where they will ultimately handle 50,000 tons of ore a day. This increase in capacity will be gradual, as it has been in the past. Besides the present methods of handling of ore it is understood that other methods of treatment will be installed that will greatly increase the efficiency of the plants. The work on the leaching plant will start in a few days now.

Alta.

The strike of an 18-in. vein on the Michigan-Utah property has been followed continuously for 50 ft. The ore occurs in a fissure in the limestone and varies in width from 15 ins. to 3 ft. The Grizzly fissure, in which the ore occurs, strikes east and west. It is being followed to the east. Within 60 ft. it should intersect, according to the surveys, the Lavinia vein, famous for its ore production in the upper workings. The Grizzly fissure strikes northwest and the Lavinia strikes southwest. When the point of intersection is reached it will be about 300 ft. below the stopes on the Lavinia vein. Severely-five feet lower both fissures intersect the quartzite-limestone contact, striking northwest and dipping northeast. With the ore showing in the Grizzly, the management is of the opinion that a large ore body will be developed when the winze is sunk along the ore body to the contact.

According to Superintendent Blake of the Wasatch Mines Co., the drainage tunnel has been started. The company intends to get under the deposits shown in the old workings. It is estimated that it will require 6000 ft. of development to get to the objective point in Wasatch ground, and the management believes that this work can be accomplished within 8 months. A careful study of the geology of the country has been made and it is the opinion that the drainage of the shaft down to the new tunnel level will be accomplished after the tunnel has been driven 2500 ft. from its portals. The new workings will open the Wasatch mines to an additional depth of approximately 350 ft. below the present lowest workings and there will also be an opportunity to mine below the tunnel level afforded, as with small pumps it is believed that the drainage can be successfully accomplished to a considerable depth. The water will only have to be raised to the tunnel level and this adit will carry off all the flow from the upper water courses. It will drain a lot of territory besides that being operated by the Wasatch Mines Co. By extending it beyond the Wasatch shaft it will drain and develop a lot of territory under the townsite and beyond into the heart of Alta.

Eureka.

At the Red Wing property work has been progressing. The ground is south and adjoining the well-known Scranton property and undoubtedly traversed by the same ore-bearing veins. The tunnel, by which the ground is being developed, is now in about 85 ft. and it is estimated that only a few feet of drifting will be necessary to carry it to the vein in

which commercial ore should be found. For some distance the work has been carried on in a heavily mineralized lime formation and the showing could hardly be more promising.

At the Lehi-Tintic new machinery has been purchased. The equipment consists of a 4-drill air compressor, drills, motor, etc. Connections will be made with the Utah Power Co., in order that electricity may be used in the operation of the compressor. The power company's line has already been extended to the Selma property in North Tintic and the cost of extending it to the Lehi-Tintic will not be large, besides there is a chance for the company to secure the Eureka King property in the same section. It is to be equipped with electricity for the operation of both hoist and drills. Work is being handled through two tunnels and already a large amount of good prospecting has been done. With the machine drills this work can be pushed forward more rapidly and commercial ore is expected within the next few hundred feet, as two or three important veins are to be cut at splendid depth in this distance.

WASHINGTON.

Spokane.

The increase in miners' wages in the Coeur d'Alene district is prompting workmen in the mines of other regions to demand better pay, and the employees of the different companies operating in Republic have petitioned for an advance of 50 cts. a shift. The prevailing schedule is \$3.50. To consider the demands of the miners the mine owners have formed an association, of which S. H. Richardson, general manager of the Knob Hill Co., is chairman, and D. M. Drumheller, Jr., general manager of the West Hill Co. and receiver for the San Poil Co., is secretary. Republic mines are employing more men now than for several years, from 125 to 150 being on the payroll. Production also has been increased because of reduction of the freight and treatment rate to the Northport and Trail smelters, but regardless of this the most of the companies are operating on a small margin of profit, owing to the low grade of ore being shipped.

The old Germania mine, near Springdale, regarded as a promising tungsten property, has been sold to a recently organized German company, said to have been financed by the Krupp interests, according to N. V. Steinmark, one of the stockholders in the Germania Co., who has been living in California for the last several years. Steinmark states that Captain Wilhelm von Scheck, former president of the corporation, who left Spokane to join his regiment at the outbreak of the European war, has been relieved from military duty and now is in Belgium, en route to Spokane to assume the management of the mine for the new owners. The Germania mine and the Roselle, adjoining, both formerly controlled by the Germania Co., are extensively developed, more than \$500,000 having been expended in running undergrounds, erecting and equipping a 200-ton mill and establishing a camp, but before shipments were begun the property became involved in litigation and never was operated. The mill was dismantled several months ago, but the buildings and the workings have been kept in excellent condition, a force of watchmen and caretakers having been maintained during the years of idleness. Several months ago an English firm, represented by Fletcher T. Hamshaw of Seattle, endeavored to purchase the holdings, but there were so many persons who claimed to have title, and the promise of litigation was so evident, that Hamshaw finally abandoned the effort. "Several parties, including one I represented, have been negotiating for months with the different parties claiming to have the disposition of the mine, for its sale or lease," said W. V. Garrett, mining broker and tungsten ore buyer. "The title appeared to be badly involved. The original discovery was the Roselle, located by George Newman, and the ore bodies afterward developed were all on that claim. The Germania property was located all round it and the Roselle was jumped by agents of the Germania. They could not make their title stick, however, and finally leased and bonded the property, the Roselle stock

being put in escrow in a Spokane bank. When the Germania got into financial difficulties, was closed down and attached, the title to the Roselle remained clear and the German bondholders of the Germania, to protect themselves, exercised the option on the Roselle stock and took over the control, at least, of that property."

WISCONSIN-ILLINOIS.

Highland.

Saxe-Lampe Mining Co. is rushing to completion a 100-ton concentrator for complex zinc ore deposits recently developed. For the New Jersey Zinc Co. a remodeled plant is in running order on the Red Jacket mine at Centerville. Another new mill is being built for zinc deposits on the Kennedy farm.

Montfort.

The O. P. David mine is shipping regularly, making 2 to 4 cars blende weekly. This is the only zinc ore producer in an area of miles.

Linden.

A big tonnage of low-grade concentrates are being held here by operators. The Mineral Point Mining Co., incorporators Priestly, Smith & Fawkes, have a new mine fully developed on the Wickes allotment, and a 100-ton power and concentrating plant is now being supplied. Another new plant is nearing completion for the Spring Hill Mining Co. Big strikes with drill ahead of the main working face of the Gilman mine insures a heavy producer for sometime to come. Operations were started last week on the Weigle-Jacobs mine. The Silver Dollar has been taken over by local interests who are equipping. Ross Bros., Optimo No. 2, and Optimo No. 3, Glanville, Stoner, Gilman, Hinkle and others, are all producing. The Linden Zinc Co. has been running at minimum capacity pending alterations and repairs. Several cars of high-grade ore have been carried in bin for some time, indicating that offerings of recent date have not been satisfactory. The company has restricted its buying of low-grade ore, and stock on hand is low.

Mineral Point.

The New Jersey Zinc Co. has increased its sulphuric acid capacity to 25 tons. Prices of oxide zinc quotable by the New Jersey Zinc Co. have been reduced, notification going into effect July 1. Much low-grade calcined blende ores from the west, and Canadian carbonate zinc ore, is being received at the oxide works of the Mineral Point Zinc Co. The Mineral Point Public Service Co. is extending its service to Richland Center, 55 miles north. Mulhairn Mining Co. has developed a strong blende producer. Shipments of high-grade zinc ore from the two refining plants—the Mineral Point Zinc Co. for June aggregated 67 cars, 5,100,000 lbs. The National Separators at Cuba was next with 50 cars of 60% blende, 1,080,000 lbs. Wisconsin Zinc Roasters at New Diggings and Galena, 45 cars, 3,755,000 lbs. Total direct to smelter for June exceed 20,000,000 lbs.

Cuba.

National Zinc Ore Separating Co. has been discarding coal firing and a new gas producer is now in operating order which will materially raise the efficiency of the plant. J. H. Garrett & Co., 35 S. Dearborn street, Chicago, have a producer in going shape with equipment on the Anthony mine, and now two new producers are planned with equipment on the Dall lease. Utt-Thorne Mining Co. is producing heavily and Geo. L. Jarrett, of Platteville, mining and constructing engineer, is behind a project to develop three new producers in this camp.

Miffin.

Shipments last week were heavier, but low-grade ores again suffered through lack of demand. Shippers were the Peacock, B. M. & B. Mining Co., Lucky Six, Biddick, Cokers, Rundell and Senator. The Rundell operated for the Vinegar Hill Co. extensions of the range have carried into the Yewdall lease, and a new shaft is down in ore and a new 100-ton milling plant is being constructed. Another

new 200-ton concentrator is assuming operation on the Big Tom for the M. & A. Mining Co. of Platteville. A new mine is being developed on the Hugh R. Livingston allotment. Cleveland Mining Co. of Hazel Green is engaged in completing a small plant and developing a new producer on the O. K. leasehold formerly owned by Linden parties. Recent drilling operations in the west quarter of the district show that the main range, a big east and west, is now defined for a distance of 8 miles. It is the longest east and west range in the Wisconsin field.

Platteville.

Ore deliveries for June, including the 24th, show about 40,000,000 lbs. of zinc ore handled, the production falling for the month considerably under this amount, due partly to bad weather. Sales of lead ore 650,000 lbs.; pyrites all from National plant at Cuba to General Chemical Co., 2,266,600 lbs. Millions of pounds of fine pyrites, by-product of zinc ore refineries in this field, are being carried over. One large operator protected by contract claims the cause is found in the increased capacity for making spot acid and a demand for high-grade sulphur from Louisiana mines and high-grade sulphur ores carrying greater acid values. No relief from the present situation is in sight in this field. Prices for the month of June on blende show the range to have held steadily on a base of \$75 down to \$70 on zinc values ranging as low as 52% zinc. Many new mines are being developed and outfitted in this district which is in better shape for zinc mining on a large scale than ever before in its history.

Benton.

In matter of crude zinc ore production, this district eclipsed all its nearest competitors by 1 to 1, shipping 18,000,000 lbs. of concentrates during June up to the 24th. Leasing of unexplored lands took on added impetus during the month and more drilling machines were in actual operation than ever before. The Wisconsin Zinc Co. and Vinegar Hill Co. operated 35 machines at different points in the field. The Frontier Co. was busy with 12 outfits, and small leasing companies all over the district were going with one or two machines each. The lowered prices on ore caused some agitation over the wage scale. The lack of demand for low-grade ore has inspired in many of the independent operators a desire to install zinc ore separators in connection with the mine outfit. One such is going in at Shullsburg. The Cuba Campbell Separator is again running under new management and two new roasting and separating plants are planned for Hazel Green.

WYOMING.

Rock Springs.

E. E. Leshar, of the Geological Survey, states that the production of coal in Wyoming in 1915 was 6,554,028 short tons, an increase of 78,735 tons, or more than 1%, as compared with 1914. The greatest increase was in the Rock Springs field, Sweetwater county, and amounted to more than 122,000 tons. Hot Springs and Converse counties also had increases but all other counties recorded small decreases. The total value of the coal for the state decreased nearly 5%, from \$10,033,747 in 1914 to \$9,555,804 in 1915. The increase in the Rock Springs field is attributed to a strong demand for coal by both the railroads and the domestic and steam coal users during the last half of the year, and to the fact that there were no labor troubles or lack of railroad cars. Normally a considerable quantity of Wyoming coal from the Sheridan field reaches market in northern Montana, Idaho, and Washington (in and about Spokane), but Canadian coal now admitted duty free is reported to have partly replaced it, and to that cause the decreased production in Sheridan county is partly due. Abundance of water in the Black Hills for the hydro-electric plants cut off a part of the market for Wyoming coal. The number of men employed in the coal mines of Wyoming decreased from 8117 in 1914 to 7214 in 1915, but the average number of days worked increased from 192 to 201.

CANADA.

BRITISH COLUMBIA.

Silverton.

Damage to the power plant of the Standard Silver-Lead Mining Co., caused by the recent freshets in the region, has been repaired, and operations have been resumed at capacity in both the mine and the mill.

Kaslo.

Charles F. Caldwell, manager of the Jackson Basin Zinc Mines Co., is in Spokane arranging for the complete organization of that corporation. Caldwell has bonds on the Sunset Bell, U. S., Echo, Alameda and one or two other groups of properties which are being put into the Jackson Basin Co. for about \$250,000. He is associated with Volney D. Williamson, A. L. White, W. Y. Williams and other Spokane men. The corporation will have 2,000,000 shares. Ample funds for development will be provided.

Trail.

The new sulphuric acid plant of Con. Mining & Smelting Co. is finished and General Manager R. H. Stewart states that it will go into operation this week. The new structure is a steel and brick building 50 by 150 ft., and is entirely lined with lead. The plant will produce immediately about 10 tons of acid a day. Half of the output will be used by the company in its lead and zinc refineries and the other half will be sold in the market. A large part of the sulphur which formerly escaped into the air and damaged vegetation in the district will be saved and utilized in the new plant.

Nelson.

The Nelson, Slocan and Eastern British Columbia Mining Men's Club has been organized here with a large membership. The purpose is to give aid to all legitimate mining enterprises in those districts and to add social features to the work of the mining men. Officers chosen are as follows: Hon. L. A. Campbell, Minister of Mines, Victoria, honorary president; Frank C. Bailey, secretary of the Spokane Mining Men's Club, and Sidney Norman, Spokane, honorary vice-presidents; S. S. Fowler, mining engineer of the Blue Bell mines, Riondel, honorary vice-president; J. J. Malone, mayor of Nelson, president; Bruce White of the Noonday mine, Sandon, representing the West Kootenai district, vice-president; George Stark, Invermore, representing East Kootenai district, vice-president; Duncan McIntosh, Greenwood, representing Boundary district, vice-president. Fred A. Starkey, Nelson, president of Associated Boards of Trade of Eastern British Columbia, secretary; E. W. Widdowson, Nelson, provincial assayer, treasurer. The directors are C. F. Caldwell, Utica mines, Kaslo; W. P. Pool, Reno mines, Sheep creek; Dr. Willson, Kootenai Gold mines, Granite; A. G. Larson, Lucky Jim mine, Spokane and Nelson; J. A. Gilker, merchant, Nelson.

Coleman.

The McGillivray Creek Coal & Coke Co. will pay on July 20 a dividend of 1 ct. a share, or \$24,391. This will increase the total to \$73,173, two dividends of 1 ct. each having been paid in 1915. The following officers were elected at the recent meeting: President, Henry L. Simons, Glencoe, Minn.; vice-president, James A. Nowell, St. Paul, Minn.; secretary-treasurer, W. E. Cullen, Jr., Spokane; directors in addition to the above, Fitzhugh Burns, St. Paul, and Lorne A. Campbell, Rosslund. George Kellock of Coleman is colliery manager, and R. S. McKibben, also of Coleman, assistant to the president. The directors' report showed that 158,550 tons of coal had been mined and marketed during the year. The payroll aggregated \$203,118, an average of 241 men having been employed for 206 days. Coal developed was stated at 686,761 tons, and net profit for the year's operations, \$80,262. The conservative way in which the company is managed was instanced by the charge of \$1 for development for the year, it being the company's custom each year to write off the entire cost of development by

charging it against production. The ore reserve of nearly 700,000 tons consequently stands the company nothing.

Vancouver.

An analysis of ore lately discovered in the Omineca district shows values of nearly \$200. The property is situated on Rocher de Boule mountain and adjoins that of the same name, but the claims carrying this ore are the northerly portion of the company's property, and not on the strike of the Rocher de Boule veins. Alexander Sharp, M. E. of Vancouver, completed an examination and report on the property 4 weeks ago and the analysis was made from a sample brought from the mine by him. It exceeds the average of gold values of his samples, which was \$73.28. Sharp reports that the vein is a fissure in granite and that he found a continuous surface pay shoot over some 1200 ft. in length; the fissure being from 3 to 4 ft. in width, and the clean ore from 12 to 36 ins. in width and the difference in elevations over this distance, 800 ft. A. Erskine Smith has formed a company to develop and mine the ore under the name of the New Hazelton Gold-Cobalt Mines, Ltd.

ONTARIO.

Cobalt.

According to the Buffalo Mines, Ltd., report the total production for the year ending April 30, 1916, including sales of silver, silver on hand and unsettled for at the smelter, amounted to 705,055 ozs. There is broken, ready for extraction, about 8000 tons of ore in the stopes, 5000 tons of unbroken ore, and 5000 tons of ore dumps on surface, averaging about 18 ozs., 300,000 tons of tailings from the concentrator containing 1,600,000 ozs. of silver, 7000 tons of residue from treatment of high-grade ore, containing in addition to silver values, cobalt, nickel and arsenic. The gross earnings from mining operations for the year were \$524,973.46. Total expenses of operation and administrative and financing charges were \$266,205.97. After providing for various other charges and adjustments the total surplus at the end of April stands at \$610,888.80. During the year the mill treated 37,152 tons of milling ore, and 1000 tons of sand and slime tailings, or a total of 38,152 was treated. Of this, 30,079 tons were treated by wet concentration, averaging 19 ozs. of silver per ton, with a recovery of 431,512 ozs., and 8073 tons were treated by combination concentration and oil flotation averaging 25.46 ozs. of silver per ton, with a recovery of 197,601 ozs. During the year the cyanide plant treated 6340 tons of slime from the concentrator, averaging 10.54 ozs. of silver per ton, of which 55,161 ozs. were recovered. Total recovery by mill and cyanide was 684,274 ozs. The amalgamation plant and refinery treated during the year 13,465 lbs. of high-grade ore, direct from the mine, 285,554 lbs. of jig concentrates, 718,240 lbs. of table concentrates, and 1952 lbs. of metallics from the low grade mill and 6662 lbs. of precipitates from the cyanide plant, or a total of 612,020 ozs. of silver treated, a portion of which was on hand at the beginning of the year and accounted for in last year's production. The total production of bullion from this plant was 775,253 fine ozs., and 4070 ozs. scrap, etc., on hand, making a total of 779,323 fine ozs. recovered with residue still to be treated.

It is strongly rumored that Beacon Con. will install a flotation plant to treat tailings from its mill. Experiments being conducted for the purpose of making a recovery of silver from mill tailings, which in the past have been considered valueless, have been successful. The main shaft is down 1630 ft. and at the present a station is being cut at the 1600 level. The intention is to drive a cross-cut both east and west of the shaft, which by reason of the dip of the diabase intrusion it is thought that exploration work can be carried on both above and below the contact. The May statement of the company showed: Bullion in storage, 186,433.19 ozs., ore at smelters, 39,350.03 tons; ore bagged at mine, 68,700 ozs.; cash on hand, \$92,483.68. Work on the upper levels of the property, a large proportion of which is unexplored, is progressing favorably and on the 530 level a shoot of high-grade ore, about 4 ins. in width, was encountered. The latter has been proven for a distance of about 20 ft.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

I. GEOLOGY

GEOLOGY AND MINERALOGY

Geology

Fearnside, W. G.—*Some Effects of Earth Movement on the Coal Measures of the Sheffield District*. [A paper read before the Midland Inst. on Mining, Civil and Mechanical Eng.].—I. & C. Tr. Rev. June 2 1916; p 630; pp 2*; Coll'y Guard. June 2; p 1039; pp 1½*; June 9; p 1088; pp 2*; 70c.

Freeman, O. W.—*Gold Mining in the Judith Mountains, Montana*. [Briefs are given on some of the plants and mines. The geology and genesis of the ores and formation containing them is given with a general topographic description of the country].—M. & S. P. June 10 1916; p 863; pp 2½*; 20c.

Hewett, D. F.—*Some Manganese Mines in Virginia and Maryland*. [Most of the important mines are described separately. Four types of deposits are described as regards their geology and genesis].—U. S. G. S. Bull. 640-C; pp 35*.

Howard, L. O.—*Ozokerite in Utah*. [A brief review of the deposits is made and a description of the methods of refining the raw product are given. Some of the deposits and operating properties are described].—M. & S. P. June 17 1916; p 907; pp 4½*; 20c.

Marstrander, R.—*The Mineral Resources of Uruguay, South America* [The country has been exploited but little. Iron-manganese ore is of greatest importance, though gold and copper are found and there is possibility for lead, silver, coal and petroleum].—Mg. Mag. June 1916; p 315; pp 6*; 50c.

Miller, W. G.—*Silver Deposits of the Cobalt District*. [Abst. from a report by the author, who is provincial geologist of Ontario. Considerable history of the camp is given and excellent views showing the nature of the formation are reproduced].—Canadian Mg. Jnl. June 15 1916; p 291; pp 7*; 35c.

Nicholls, H. E.—*The Nature of Nigerian Tin Deposits*. [Discusses the mode of occurrence of cassiterite and does not

agree with the theory that the deposits are secondary. Gives examples of the alluvial deposits coming from the weathered granites and lodes].—Mg. Mag. June 1916; p 321; pp 3*; 50c.

Petre, R. W.—*Manganese in South Carolina*. [A detailed geological description].—E. & M. J. June 10 1916; p 1019; pp 1¼*; 25c.

Shelley, J. W.—*Graphite in Madagascar*. [Takes up geology, prospecting, mining, costs, labor conditions, production, law and a general description of the country and conditions to be found there].—Mg. Mag. June 1916; p 324; pp 7*; 50c.

Singewald, J. T., Jr.; Miller, B. L.—*The Cerro de Pasco District, Peru*. [On the history of the camp which was originally a silver camp. The geology of the large copper deposits is given the greater preference].—E. & M. J. June 10 1916; p 1015; pp 4*; 25c.

Ore Genesis

Hewett, D. F.—*Some Manganese Mines in Virginia and Maryland*. [Most of the important mines are described separately. Four types of deposits are described as regards their geology and genesis].—U. S. G. S. Bull. 640-C; pp 35*.

Nicholls, H. E.—*The Nature of Nigerian Tin Deposits*. [Discusses the mode of occurrence of cassiterite and does not agree with the theory that the deposits are secondary. Gives examples of the alluvial deposits coming from the weathered granites and lodes].—Mg. Mag. June 1916; p 321; pp 3*; 50c.

Mineralogy and Petrography

Miller, W. G.—*Silver Deposits of the Cobalt District*. [Abst. from a report by the author, who is provincial geologist of Ontario. Considerable history of the camp is given and excellent views showing the nature of the formation are reproduced].—Canadian Mg. Jnl. June 15 1916; p 291; pp 7*; 35c.

II. ORES AND METALS

(I) METALS AND ORES

Copper

Ball, L. C.—*Notes on a Short Tour in the Gladstone District, Queensland*. [Gold,

copper, coal and molybdenum properties were visited and are briefly described].—Queen Govt. Mg. Jnl. May 15 1916; p 213; pp 1½*; 35c.

Hixon, H. W.—*Electrothermic Zinc Smelting in Puebla, Mexico*. [A description of the operation of the Teziutlan Copper Co.'s plant is given. The ores run 4% copper and 10% zinc. The zinc is obtained as dust for cyanidation work].—E. & M. J. June 17 1916; p 1080; pp 1¼; 25c.

Magnus, B.—*The Sintering of Flotation Concentrates*. [Deals with the operation at Mount Morgan, Queensland, Australia. The ores contained about 2% copper and 7 dwt. gold. Dwight-Lloyd sintering machines were used].—E. & M. J. June 10 1916; p 1032; pp ¾*; 25c.

Marstrander, R.—*The Mineral Resources of Uruguay, South America*. [The country has been exploited but little. Iron-manganese ore is of greatest importance, though gold and copper are found and there is possibility for lead, silver, coal and petroleum].—Mg. Mag. June 1916; p 315; pp 6*; 50c.

McDonald, P. B.—*Mining at the Nevada Consolidated, Nevada*. [Items of financial interest from many other copper companies are spoken of. The deposit is described from a mining standpoint. The methods of timbering, haulage, drilling, etc., are described].—M. & S. P. June 10 1916; p 858; pp 4*; 20c.

Probert, F. H.—*Surficial Indications of Copper*. [Discusses and describes in detail the chemistry of the oxidized zone].—M. & S. P. June 17 1916; p 893; pp 6¼*; 20c.

Samuel, J. M.—*Methods of Measuring Dust Losses at Copper Queen Works, Arizona*. [Abst. of a paper to be read before the Arizona section of the A. I. M. E. Detailed description of methods employed for determining the losses carried as dust in the waste furnace gases].—E. & M. J. June 17 1916; p 1061; pp 2¾*; 25c.

Scott, W. A.—*Mill Equipment of the Engels Copper Mining Co., California*. [Mineral Separation Co.'s flotation cells are used. Crushing and classifying are described and the mill handles about 500 tons].—Mg. World June 24 1916; p 1165; pp 2*; 10c.

Scott, W. A.—*Milling and Smelting at Humboldt, Arizona*. [The plant of the

Consolidated Arizona Smelting Co. is reviewed, including its crushing, concentration, flotation and smelting equipment and operations].—Mg. World June 17 1916; p 1133; pp 1¼*; 10c.

Scott, D. B.—*Stopping Hard Ore at Miami, Arizona*. [Abst. from a paper read before the A. I. M. E.].—M. & S. P. June 24 1916; p 943; pp 4*; 20c.

Singewald, J. T., Jr.; Miller, B. L.—*The Cerro de Pasco District, Peru*. [On the history of the camp, which was originally a silver camp. The geology of the large copper deposits is given the greater preference].—E. & M. J. June 10 1916; p 1015; pp 4*; 25c.

—*The King Process of Refining Copper*. [Extracts from U. S. patent. Hydrocarbon oil under pressure is introduced below the copper-bath's surface. It is shown being used in a tilting furnace].—Mg. World June 24 1916; p 1173; pp 2*; 10c.

Gold Fields and Mining

Alderson, M. W.—*Mining Possibilities in Colombia, S. A.* [A description of the alluvial deposits is given, with details of operation at several properties. In discussing the good points and faults items of financial interest, production figures and costs are brought out].—Mg. World June 21 1916; p 1169; pp 3*; 10c.

Ball, L. C.—*Notes on a Short Tour in the Gladstone District, Queensland*. [Gold, copper, coal and molybdenum properties were visited and are briefly described].—Queen. Govt. Mg. Jnl. May 15 1916; p 213; pp 1½*; 35c.

Dudley, Boyd, Jr.—*The Distribution of Silver Between Metallic Lead and Litharge Containing Slag*. [Formulae which may be used for correction of this loss are given and a complete review of investigations made to determine what amount of silver is in the lead and what part in the litharge slag, is given].—Met. & Chem. Engg. June 15 1916; p 695; pp 6*; 30c.

Freeman, O. W.—*Gold Mining in the Judith Mountains, Montana*. [Briefs are given on some of the plants and mines. The geology and genesis of the ores and formation containing them is given with a general topographic description of the country].—M. & S. P. June 10 1916; p 863; pp 2½*; 20c.

Lee, C. F.—*Some Hydraulic Mining Problems*. [Abst. of a paper read before the A. I. M. E. Costs, difficulties and details of operation in the Atlin district, B. C., are given. Detailed data and information regarding sluicing are included].—Mg. World June 24 1916; p 1181; pp 1*; 10c.

Magnus, B.—*The Sintering of Flotation Concentrates*. [Deals with the operation at Mount Morgan, Queensland, Australia. The ores contained about 2% copper and 7 dwt. gold. Dwight-Lloyd sintering machines were used].—E. & M. J. June 10 1916; p 1032; pp ¾*; 25c.

Marstrander, R.—*The Mineral Resources of Uruguay, South America*. [The country has been exploited but little. Iron-manganese ore is of greatest importance, though gold and copper are found and there is possibility for lead, silver, coal and petroleum].—Mg. Mag. June 1916; p 315; pp 6*; 50c.

Mostowitsch, W.—*Extraction of Gold and Silver from Matte by Lead*. [Abst. translation from the Jnl. of the Russian Metallurgical Soc. For the greater part the text is on the results of experimental work].—Met. & Chem. Engg. June 15 1916; p 705; pp 2¾*; 30c.

Rickard, T. A.—*The Re-Opening of Old Mines Along Mother Lode, California*. [Gives details on the history of present and historical companies. Figures on their production and methods of operation are given].—M. & S. P. June 21 1916; p 935; pp 5*; 20c.

Rye, C. M.—*Gold Mining in the Philippines*. [Water power and combustion engines are used considerably. The descriptions are general, but separate in describing the operations of companies. Both amalgamation and cyanidation are employed].—M. & S. P. June 17 1916; p 900; pp 2½*; 20c.

Thomas, C. A.—*Lübecker Excavator in the Klondike, Alaska*. [This dredge is to be tried by the Northwest Corp. It is a chain-bucket excavator heretofore used in digging brown coal in Germany. A special design has been made to act as a gold dredge here].—E. & M. J. June 17 1916; p 1057; pp 2¾*; 25c.

—*Rhodesia Chamber of Mines, Report of the Executive Committee*. [In tabulated form the gold production for the different companies and districts, is given].—Rhodesia Chamber of Mines; Mar. 1916; pp 5; 35c.

Smelting in Puebla, Mexico. [A description of their operation of the Teziutlan Copper Co.'s plant is given. The ores run 4% copper and 10% zinc. The zinc is obtained as dust for cyanidation work].—*E. & M. J.* June 17 1916; p 1080; pp 1¼; 25c.

Parmalee, J. G.—*Flotation Process at the Standard Mill, Silverton, B. C.* [The ores are zinc-lead containing much lead silver. The Wyman pneumatic flotation machine is shown and described in detail. Assays of the concentrates are given, with details of mill operation and flow sheet].—*Mg. World* June 17 1916; p 1121; pp 3*; 10c.

—*Missouri's Mine Output in 1915*. (Abst. of an advance report of the U. S. G. S. Production figures are given and a review of the mine and smelter conditions and operations is made).—*Mg. World* June 17 1916; p 1128; pp ¾; 10c.

(II) NON-METALS**(A) FUELS****Coal Fields and Mining**

Ball, L. C.—*Notes on a Short Tour in the Gladstone District, Queensland*. [Gold, copper, coal and molybdenum properties were visited and are briefly described].—*Queen. Govt. Mg. Jnl.* May 15 1916; p 213; pp 1½*; 35c.

Fearnside, W. G.—*Some Effects of Earth Movement on the Coal Measures of the Sheffield District*. [A paper read before the Midland Inst. of Mining, Civil and Mechanical Eng.].—*I. & C. Tr. Rev.* June 2 1916; p 630; pp 2*; 35c; *Coll'y Guard.* June 2; p 1039; pp 1½*; June 9; p 1088; pp 2*; 70c.

Marstrander, R.—*The Mineral Resources of Uruguay, South America*. [The country has been exploited but little. Iron-manganese ore is of greatest importance, though gold and copper are found and there is possibility for lead, silver, coal and petroleum].—*Mg. Mag.* June 1916; p 315; pp 6*; 50c.

Steelman, J.—*The Wire Rope and the Coal Mine*. [A general detailed discussion on the proper kinds of rope for different uses, such as hoisting, haulage, zuying, aerial tramways, etc.].—*Coal Age* June 24 1916; p 1082; pp 5½*; 20c.

Winmill, T. F.—*The Absorption of Oxygen by Coal*. [A paper read before the Inst. of Mining Eng. The effect of size and percentage of oxygen in the air on the rate and quantity of oxygen absorbed by the coal is brought out].—*I. & C. Tr. Rev.* June 9 1916; p 660; pp 3; 35c.

Winmill, T. F.—*The Estimation of Moisture in Coal*. [A paper read before the Inst. of Mining Eng.].—*I. & C. Tr. Rev.* June 9 1916; p 671; pp 1*; 35c.

Coke

Gosrow, R. C.—*Coke as a Reducing Agent in the Electric Smelting Furnace*. [Details of operation for this practice is given with discussion on the advantages and disadvantages].—*Met. & Chem. Engg.* June 15 1916; p 691; pp 3; 30c.

—*New Coke Ovens at Port Clarence Works*. [In detail gives the plant arrangement and operation of Bell Bros. Ltd., plant at Middlebrough, England].—*I. & C. Tr. Rev.* May 26 1916; p 606; pp 2*; 35c.

Natural Gas

McLeish, John.—*Annual Report on the Mineral Production of Canada, 1914*. [Each mineral is reported on separately. The imports, exports, production and condition of the trade are given].—*Can-*

ada Dept. of Mines, Mines Branch, No. 384; pp 362.

Petroleum

Marstrander, R.—*The Mineral Resources of Uruguay, South America*. [The country has been exploited but little. Iron-manganese ore is of greatest importance, though gold and copper are found and there is possibility for lead, silver, coal and petroleum].—*Mg. Mag.* June 1916; p 315; pp 6*; 50c.

(B) STRUCTURALS AND CERAMICS**Concrete**

Del Mar, Algernon.—*Concrete Foundation for Mining Installations*. [Gives details of the concrete work and shows drawings of many forms with discussion on this form of foundation].—*Mg. World* June 17 1916; p 1129; pp 2*; 10c.

Drucker, M. A.—*Diagrams for the Design of Reinforced Concrete T Beams*.—*Engg. & Cont.* June 28 1916; p 579; pp 1½*; 20c.

Talbot, A. N.; Slater, W. A.—*Tests of Reinforced Concrete Slab Structures*. [Practical tests which have been made on five different large buildings of concrete. Most minute descriptions are given].—*Univ. of Ill. Bull.* 84; pp 128*.

Wig, R. J.; Williams, G. M.; Gates, E. R.—*Strength and Other Properties of Concrete as Affected by Materials and Methods of Preparation*. [Many tests are given, the most important being a long series of tests on concrete mixtures].—*U. S. Bur. of Stand. Tech. Paper* 58; pp 172*; 45c.

Lime

Hough, N. G.—*Field Work of the Hydrated Lime Bureau*. [An account of field investigation of various sorts made by this bureau].—*National Lime Mfg. Assn.* April 1916; pp 7; 35c.

(C) OTHER NON-METALS**Acids**

Martin, G.; Foucar, J. L.—*Sulphuric Acid and Sulphur Products*. [Describes modern plants, their methods and other common methods of manufacturing sulphur products. Statistics are given].—*Crosby, Lockwood & Son, London; book; pp 100*; \$2.*

Feldspar

Watts, A. S.—*The Feldspars of the New England and North Appalachian States*. [Contains description of the geology and separate descriptions of the quarries. Tests for the feldspar are given, as are methods of quarrying, pumping, crushing, concentration, etc.].—*U. S. Bur. of Mines Bull.* 92; pp 181*; 35c.

Fluorspar

Burchard, E. F.—*Fluorspar in 1915*. [The report shows that the production has materially increased and the imports decreased to nearly a negligible quantity].—*Min. Res. of U. S. II:6; pp 9.*

Fullers Earth

Middleton, J.—*Fuller's Earth in 1915*. [Treats on the occurrence, uses, production, the industry by states].—*Min. Res. of U. S. II:3; pp 4.*

Gems

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*. [Prospecting, sampling, dredging, washing and dressing, water supply and transportation in the diamond fields of this area are reviewed].—*S. Afr. Mg. Jnl.* May 6 1916; p 133; pp 1; 35c.

Graphite

Shelley, J. W.—*Graphite in Madagascar*. [Takes up geology, prospecting, mining, costs, labor conditions, production, law and a general description of the country and conditions to be found there].—Mg. Mag. June 1916; p 324; pp 7*; 50c.

Mica

— *Mica Mining*. [A general review of the mica mining and marketing industry. Production, sorting and concentration of the raw material is briefly treated on and a chart is given showing the final subdivision of 1,000 lbs. of the raw material and what total amount will be obtained for different grades of the same].—M. & S. P. June 10 1916; p 866; pp 1; 20c.

Paint

Howard, L. O.—*Ozokerite in Utah*. [A brief review of the deposits is made and a description of the methods of refining the raw product are given. Some of the deposits and operating properties are described].—M. & S. P. June 17 1916; p 907; pp 4½*; 20c.

Pyrites

Winmill, T. F.—*The Atmospheric Oxidation of Iron Pyrites*. [A paper read before the Inst. of Mines, Eng.].—I. & C. Tr. Rev. June 9 1916; p 664; pp 1; 35c.

Sulphur

Martin, G.; Foucar, J. L.—*Sulphuric Acid and Sulphur Products*. [Describes modern plants, their methods and other common methods of manufacturing sulphur products. Statistics are given].—Crosby, Lockwood & Son, London; book; pp 100*; \$2.

III. TECHNOLOGY**MINES AND MINING****Prospecting**

Probert, F. H.—*Surficial Indications of Copper*. [Discusses and describes in detail the chemistry of the oxidized zone].—M. & S. P. June 17 1916; p 893; pp 6¾*; 20c.

Shelley, J. W.—*Graphite in Madagascar*. [Takes up geology, prospecting, mining, costs, labor conditions, production, law and a general description of the country and conditions to be found there].—Mg. Mag. June 1916; p 324; pp 7*; 50c.

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*. [Prospecting, sampling, dredging, washing and dressing, water supply and transportation in the diamond fields of this area are reviewed].—S. Afr. Mg. Jnl. May 6 1916; p 133; pp 1; 35c.

Surveying and Drafting

Butcher, E. W. R.—*Standard Sub Turns*. [Treats on the standardizing of curves in sub-level haulage so that a supply of tracks may be had and thus eliminate the work of specially bending them].—E. & M. J. June 10 1916; p 1029; pp ¾*; 25c.

McCrystle, J.—*Underground Mine Roads*. [A list of set rules to be adhered to by the track layers and foremen. They have to do with details, distances, etc., to be noted by the trackmen and surveyors].—Coal Age June 10 1916; p 1000; pp 3¾*; 20c.

Drilling and Boring

Key, Cooper A.—*Dust Allaying in Rand Mines, South Africa*. [Gives de-

tailed results and methods used for allaying the dust caused from drilling and blasting].—E. & M. J. June 17 1916; p 1065; pp 2¾*; 25c.

McDonald, P. B.—*Mining at the Nevada Consolidated, Nevada*. [Items of financial interest from many other copper companies are spoken of. The deposit is described from a mining standpoint. The methods of timbering, haulage, drilling, etc., are described].—M. & S. P. June 10 1916; p 858; pp 4*; 20c.

Reh fuss, L. A.; Reh fuss, W. C.—*Portable Mining Equipment for Prospects*. [A description of gasoline motor units for work in various capacities at prospects].—E. & M. J. June 10 1916; p 1025; pp 2¾*; 25c.

— *Drill- and Tool-Sharpening Shop at the Copper Queen Mine, Arizona*. [The shop handles 1,200 pieces per day. Detailed costs and methods of operation are given which include a description of the equipment].—E. & M. J. June 24 1916; p 1099; pp 5¼*; 25c.

Explosives and Blasting

Fay, A. H.—*Coal Mine Fatalities in the United States in March, 1916*. [A list of permissible explosives, lamps and motors tested prior to May 1, 1916, is also given].—U. S. Bur. of Mines Monthly Statement; pp 22.

Key, Cooper A.—*Dust Allaying in Rand Mines, South Africa*. [Gives detailed results and methods used for allaying the dust caused from drilling and blasting].—E. & M. J. June 17 1916; p 1065; pp 2¾*; 25c.

McDonald, P. B.—*Mining at the Nevada Consolidated, Nevada*. [Items of financial interest from many other copper companies are spoken of. The deposit is described from a mining standpoint. The methods of timbering, haulage, drilling, etc., are described].—M. & S. P. June 10 1916; p 858; pp 4*; 20c.

Pumps and Pumping

Watts, A. S.—*The Feldspars of the New England and North Appalachian States*. [Contains description of the geology and separate descriptions of the quarries. Tests for the feldspar are given, as are methods of quarrying, pumping, crushing, concentration, etc.].—U. S. Bur. of Mines Bull. 92; pp 181*; 35c.

Lighting

Fay, A. H.—*Coal Mine Fatalities in the United States in March, 1916*. [A list of permissible explosives, lamps and motors tested prior to May 1, 1916, is also given].—U. S. Bur. of Mines Monthly Statement; pp 22.

Hardwick, F. W.—*The History of the Safety Lamp*. [A paper read before the Inst. of Mining, London].—Coll'v Guard. June 9 1916; p 1087; pp 1½; 35c.

Hoists and Hoisting

Bulkley, J. N.—*Application of Electrical Power to Rand Mining Work*. [Results with electric winding and comparison of the cost of steam and electricity are discussed].—S. Afr. Mg. Jnl. April 29 1916; p 112; pp 1; 35c.

Steelman, J.—*The Wire Rope and the Coal Mine*. [A general detailed discussion on the proper kinds of rope for different uses, such as hoisting, haulage, gwinning, aerial tramways, etc.].—Coal Age June 24 1916; p 1082; pp 5½*; 20c.

Dredging

Alderson, M. W.—*Mining Possibilities in Colombia, S. A.* [A description of the alluvial deposits is given with details of

operation at several properties. In discussing the good points and faults items of financial interest, production figures and costs are brought out].—Mg. World June 24 1916; p 1169; pp 3*; 10c.

Lee, C. F.—*Some Hydraulic Mining Problems*. [Abst. of a paper read before the A. I. M. E. Costs, difficulties and details of operation in the Atlin district, B. C., are given. Detailed data and information regarding sluicing are included].—Mg. World June 24 1916; p 1181; pp 1*; 10c.

Thomas, C. A.—*Lübecker Excavator in the Klondike, Alaska*. [This dredge is to be tried by the Northwest Corp. It is a chain-bucket excavator heretofore used in digging brown coal in Germany. A special design has been made to act as a good dredge here].—E. & M. J. June 17 1916; p 1057; pp 2¾*; 25c.

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*. [Prospecting, sampling, dredging, washing and dressing, water supply and transportation in the diamond fields of this area are reviewed].—S. Afr. Mg. Jnl. May 6 1916; p 133; pp 1; 35c.

Mine Sampling

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*. [Prospecting, sampling, dredging, washing and dressing, water supply and transportation in the diamond fields of this area are reviewed].—S. Afr. Mg. Jnl. May 6 1916; p 133; pp 1; 35c.

Power Shovels and Explosives

Hirschberg, C. A.—*Speed and Economy of the Deep Hole Drill Wagon*. [Details of results obtained and methods used are given, including some figures on costs of operation].—Comm. Air June 1916; p 8003; pp 5½*; 20c.

Thomas, C. A.—*Lübecker Excavator in the Klondike, Alaska*. [This dredge is to be tried by the Northwest Corp. It is a chain-bucket excavator heretofore used in digging brown coal in Germany. A special design has been made to act as a gold dredge here].—E. & M. J. June 17 1916; p 1057; pp 2¾*; 25c.

Transport

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*. [Prospecting, sampling, dredging, washing and dressing, water supply and transportation in the diamond fields of this area are reviewed].—S. Afr. Mg. Jnl. May 6 1916; p 133; pp 1; 35c.

Haulage and Conveying

Butcher, E. W. R.—*Standard Sub Turns*. [Treats on the standardizing of curves in sub-level haulage so that a supply of tracks may be had and thus eliminate the work of specially bending them].—E. & M. J. June 10 1916; p 1029; pp ¾*; 25c.

Liebermann, P. B.—*Comparative Friction Test of Two Types of Mine Cars*. [Abst. of a paper read before the A. I. M. E. Plane bore and roller bearings are the two types compared].—Mg. World June 24 1916; p 1175; pp 2½*; 10c.

McDonald, P. B.—*Mining at the Nevada Consolidated, Nevada*. [Items of financial interest from many other copper companies are spoken of. The deposit is described from a mining standpoint. The methods of timbering, haulage, drilling, etc., are described].—M. & S. P. June 10 1916; p 858; pp 4*; 20c.

Steelman, J.—*The Wire Rope and the Coal Mine*. [A general detailed discussion on the proper kinds of rope for dif-

ferent uses, such as hoisting, hauling, guying, aerial tramways, etc.]—*Coal Age* June 24 1916; p 1082; pp 5½*; 20c.

Safety

Hardwick, F. W.—*The History of the Safety Lamp*. [A paper read before the Inst. of Mining, London].—*Colly Guard*. June 9 1916; p 1087; pp 1½; 35c.

Sanitation

Burrell, G. A.; Oberfell, G. G.—*Effects of Atmospheres Deficient in Oxygen on Small Animals and on Men*. [Results of a number of different tests made on both animals and men].—U. S. Bur. of Mines Tech. Paper 122; pp 12; 15c.

Key, Cooper A.—*Dust Allaying in Rand Mines, South Africa*. [Gives detailed results and methods used for allaying the dust caused from drilling and blasting].—E. & M. J. June 17 1916; p 1065; pp 2¾*; 25c.

Labor and Management

Engelder, O. G.—*Mining in Sardinia*. [A general account of the lead-zinc mines, their operation, production, etc. Labor, wages, etc., are spoken of and in this connection the law in regard to hiring and expelling employes is brought out].—M. & S. P. June 10 1916; p 862; pp 1; 20c.

Production

Alderson, M. W.—*Mining Possibilities in Colombia, S. A.* [A description of the alluvial deposits is given, with details of operation at several properties. In discussing the good points and faults items of financial interest, production figures and costs are brought out].—*Mg. World* June 24 1916; p 1169; pp 3*; 10c.

Engelder, O. G.—*Mining in Sardinia*. [A general account of the lead-zinc mines, their operation, production, etc. Labor, wages, etc., are spoken of and in this connection the law in regard to hiring and expelling employes is brought out].—M. & S. P. June 10 1916; p 862; pp 1; 20c.

Freeman, O. W.—*Gold Mining in the Judith Mountains, Montana*. [Briefs are given on some of the plants and mines. The geology and genesis of the ores and formation containing them is given, with a general topographic description of the country].—M. & S. P. June 10 1916; p 863; pp 2½*; 20c.

Miller, W. G.—*Silver Deposits of the Cobalt District*. [Abst. from a report by the author, who is provincial geologist of Ontario. Considerable history of the camp is given and excellent views showing the nature of the formation are reproduced].—*Canadian Mg. Jnl.* June 15 1916; p 291; pp 7*; 35c.

Rickard, T. A.—*The Re-Opening of Old Mines Along Mother Lode, California*. [Gives details on the history of present and historical companies. Figures on their production and methods of operation are given].—M. & S. P. June 21 1916; p 935; pp 5*; 20c.

Shelley, J. W.—*Graphite in Madagascar*. [Takes up geology, prospecting, mining, costs, labor conditions, production, law and a general description of the country and conditions to be found there].—*Mg. Mag.* June 1916; p 321; pp 7*; 50c.

—*Iron Ore Production in 1915*. [An advance report of the U. S. G. S. reviewing the situation by districts separately].—*Chem. Engg.* June 1916; p 233; pp 1½; 35c.

—*Mica Mining*. [A general review of the mica mining and marketing

industry. Production, sorting and concentration of the raw material is briefly treated on and a chart is given showing the final subdivision of 1,900 lbs. of the raw material and what total amount will be obtained for different grades of the same].—M. & S. P. June 10 1916; p 866; pp 1; 20c.

—*Missouri's Mine Output in 1915*. [Abst. of an advance report of the U. S. G. S. Production figures are given and a review of the mine and smelter conditions and operations is made].—*Mg. World* June 17 1916; p 1128; pp ¾; 10c.

—*Rhodesia Chamber of Mines, Report of the Executive Committee*. [In tabulated form the gold production for the different companies and districts, is given].—Rhodesia Chamber of Mines; Mar. 1916; pp 5; 35c.

Mining Costs

Lee, C. F.—*Some Hydraulic Mining Problems*. [Abst. of a paper read before the A. I. M. E. Costs, difficulties and details of operation in the Atlin district, B. C., are given. Detailed data and information regarding sluicing are included].—*Mg. World* June 24 1916; p 1181; pp 1*; 10c.

—*Drill and Tool-Sharpener Shop at the Copper Queen Mine, Arizona*. [The shop handles 1,200 pieces per day. Detailed costs and methods of operation are given, which include a description of the equipment].—E. & M. J. June 24 1916; p 1099; pp 5¼*; 25c.

Mining Miscellany

McDonald, P. B.—*Mining at the Nevada Consolidated, Nevada*. [Items of financial interest from many other copper companies are spoken of. The deposit is described from a mining standpoint. The methods of timbering, haulage, drilling, etc., are described].—M. & S. P. June 10 1916; p 858; pp 4*; 20c.

Scott, D. B.—*Stopping Hard Ore at Miami, Arizona*. [Abst. of a paper read before the A. I. M. E.].—M. & S. P. June 24 1916; p 943; pp 4*; 20c.

Tremoureux, R. E.—*A New Dry-House*. [Costs and details of construction for this house constructed at the Champion mine, Nevada City, Cal., are given].—M. & S. P. June 17 1916; p 903; pp 2½*; 20c.

—*Mine Plant Water System*.—E. & M. J. June 17 1916; p 1073; pp 1; 25c.

MILL AND MILLING

Crushing, Grinding, Etc.

Scott, W. A.—*Mill Equipment of the Engels Copper Co., California*. [Mineral Separation Co.'s flotation cells are used. Crushing and classifying are described and the mill handles about 500 tons].—*Mg. World* June 24 1916; 1165; pp 2*; 10c.

Scott, W. A.—*Milling and Smelting at Humboldt, Arizona*. [The plant of the Consolidated Arizona Smelting Co. is reviewed, including its crushing, concentration, flotation and smelting equipment and operations].—*Mg. World* June 17 1916 p 1133; pp 1¼*; 10c.

Flotation

Cole, A. A.—*Concentration of Cobalt Silver Ores by Oil Flotation*. [Extract of a report to the T. & O. Ry. commission. A reprint is shown of the Buffalo Mines, Ltd., flotation plant flow sheet].—*Canadian Mg. Jnl.* June 15 1916; p 301; pp 1; 35c.

Magnus, B.—*The Sintering of Flotation Concentrates*. [Deals with the op-

eration at Mount Morgan, Queensland, Australia. The ores contained about 2% copper and 7 dwt. gold. Dwight-Lloyd sintering machines were used].—E. & M. J. June 10 1916; p 1032; pp ¾*; 25c.

McClave, James.—*Difficulties Encountered in Making Oil Flotation Tests*. [A general discussion on the practice of testing oils for use in flotation].—*Mg. World* June 17 1916; p 1135; pp ¾; 10c.

Parmalee, J. G.—*Flotation Process at the Standard Mill, Silverton, B. C.* [The ores are zinc-lead containing much leaf silver. The Wyman pneumatic flotation machine is shown and described in detail. Assays of the concentrates are given, with details of mill operation and flow sheet].—*Mg. World* June 17 1916; p 1121; pp 3*; 10c.

Scott, W. A.—*Mill Equipment of the Engels Copper Mining Co., California*. [Mineral Separation Co.'s flotation cells are used. Crushing and classifying are described and the mill handles about 500 tons].—*Mg. World* June 24 1916; p 1165; pp 2*; 10c.

Scott, W. A.—*Milling and Smelting at Humboldt, Arizona*. [The plant of the Consolidated Arizona Smelting Co. is reviewed, including its crushing, concentration, flotation and smelting equipment and operations].—*Mg. World* June 17 1916; p 1133; pp 1¼*; 10c.

Concentration: Sorting, Sizing, Washing

Free, E. E.—*Properties of Slime Cakes*. [Theories of plasticities are discussed. It is said to be due to gelatinous colloid films. There is no evidence of these in slimes. Factors tending to affect the colloidal properties of slimes are discussed].—E. & M. J. June 17 1916; p 1068; pp 2¼; 25c.

Howard, L. O.—*Ozokerite in Utah*. [A brief review of the deposits is made and a description of the methods of refining the raw product are given. Some of the deposits and operating properties are described].—M. & S. P. June 17 1916; p 907; pp 4½*; 20c.

Scott, W. A.—*Mill Equipment of the Engels Copper Mining Co., California*. [Mineral Separation Co.'s flotation cells are used. Crushing and classifying are described and the mill handles about 500 tons].—*Mg. World* June 24 1916; p 1165; pp 2*; 10c.

Scott, W. A.—*Milling and Smelting at Humboldt, Arizona*. [The plant of the Consolidated Arizona Smelting Co. is reviewed, including its crushing, concentration, flotation and smelting equipment and operations].—*Mg. World* June 17 1916; p 1133; pp 1¼*; 10c.

Wagner, P. A.—*Economic Geology and Mineral Industry of Southwest Africa*. [Prospecting, sampling, dredging, washing and dressing, water supply and transportation in the diamond fields of this area are reviewed].—*S. Afr. Mg. Jnl.* May 6 1916; p 133; pp 1; 35c.

—*Mica Mining*. [A general review of the mica mining and marketing industry. Production, sorting and concentration of the raw material is briefly treated on and a chart is given showing the final subdivision of 1000 lbs. of the raw material and what total amount will be obtained for different grades of the same].—M. & S. P. June 10 1916; p 866; pp 1; 20c.

Amalgamation

Eye, C. M.—*Gold Mining in the Philippines*. [Water power and combustion engines are used considerably. The de-

scriptions are general but separate in describing the operations of companies. Both amalgamation and cyanidation are employed].—M. & S. P. June 17 1916; p 900; pp 2½*; 20c.

Lec, C. F.—*Some Hydraulic Mining Problems*. [Abst. of a paper read before the A. I. M. E. Costs, difficulties and details of operation in the Atlin district, B. C., are given. Detailed data and information regarding sluicing are included].—Mg. World June 24 1916; p 1181; pp 1*; 10c.

Palmer, L. A.—*A New Dry Amalgamator*. [The machine consists of five amalgamated copper rolls with an amalgamating trough below each. It is being tried on slimes].—Met. & Chem. Engg. June 15 1916; p 715; pp 1*; 30c.

Cyaniding

Eye, C. M.—*Gold Mining in the Philippines*. [Water power and combustion engines are used considerably. The descriptions are general, but separate in describing the operations of companies. Both amalgamation and cyanidation are employed].—M. & S. P. June 17 1916; p 900; pp 2½*; 20c.

Free, E. E.—*Properties of Slime Cakes*. [Theories of plasticities are discussed. It is said to be due to gelatinous colloid films. There is no evidence of these in slimes. Factors tending to affect the colloidal properties of slimes are discussed].—E. & M. J. June 17 1916; p 1068; pp 2¼; June 24; p 1105; pp 3½; 50c.

McArthur, J. S.—*The Discovery of Cyanidation*. [On the experimental work and experience of the author and others in an attempt to find a hydro-metallurgical method for the extraction of gold. The account dates from about 1885].—M. & S. P. June 10 1916; p 851; pp 7*; 20c.

Briquetting

Leshner, C. E.—*Fuel Briquetting in 1915*. [Little difference was shown from 1914. The industry is still in its infancy].—Min. Res. of U. S. II:1; pp 6.

CHEMISTRY AND ASSAYING

Chemistry

De Lumen, M.—*The Roasting of Blende*. [The effect of constituents of blende on sulphur elimination and roasting process. The Hasenlever, Delplace, Hegler, McDougal and Spirlet furnaces are described. Comments on the gases for sulphuric acid manufacture in England, Belgium and Germany].—E. & M. J. June 10 1916; p 1021; pp 3¼; 25c.

July				47.519		22.950
August				47.178		22.750
September				48.65		23.600
October				49.285		23.923
November				51.713		24.640
December				55.038		26.232
Year				49.690		23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Aside from a spasmodic foreign demand for copper the market has been colorless since our last report. The foreign business went almost entirely to second hands, while the producers' agencies had little in the way of orders. Prices, however, have been firmly held and from a close study of the situation it appears that any buying movement that would show signs of being fairly widespread would be quickly followed by higher prices for the red metal. The fact that prices have been maintained over a period of six weeks' inactivity proves, as has been pointed out, that the tremendous business done in the last movement will constitute a bulwark against price reaction. Inquiries for about 2,000 tons came from private buyers abroad. These were mostly for July, August and September shipments and brokers did a fairly good business in filling these orders with resale metal. The foreign buyers have apparently quickly responded to the cheap offerings by taking whatever copper is available at the lower prices. Resale copper in New York is well cleaned up, but a large consumer in Connecticut is still offering, while some metal is still available in the west. Electrolytic for July shipment sold at 26¹/₂ cts., with sales of August done at 26³/₄ cts. and September at 26 cts. For prompt electrolytic resellers secured 26³/₄@27 cts.

With the large producers there has been a slight disposition to entertain lower prices for the last four months of the year. One small producer has offered electrolytic for the last quarter at 26 cts. Any buyer seeking upward of 50,000,000 lbs. for these months would be forced to pay 27¹/₂ cts. Thus, while producers are still quoting 29¹/₂ cts. for September and ¹/₄ ct. for each month following, these prices are merely for small lots, as consumers have received offers on round lots at 1@2 cts. under the outside figures. This by no means can be construed as a weakening in the copper situation. At all times large buyers can secure a preferential price. Casting copper is very easy in second hands, but producers are not offering beyond September. Second hands offered July at 24¹/₂ cts. and August at 24 cts., with producers asking these prices respectively for August and September.

Exports during June have come fully up to expectations. The movement of copper abroad is beginning to co-ordinate with the heavy foreign buying and copper factors who thought they saw a "nigger in the woodpile" are now disposed to concede that foreign absorption in the last movement came close to 500,000,000 lbs. for delivery this year. At the present rate of output, 200,000,000 lbs. a month, this would take 2¹/₂ months' production. Exports reported in June to-

take 35,753 tons and with gulf and Pacific ports to be added the June movement may come close to 40,000 tons. From the figures now available exports in the first half of the year total 145,000 tons, being about 7000 tons greater than in the first half of 1915.

An upturn has developed in copper at London, but the advance had no special significance. Standard spot went up £5 in spot and £4 in futures last week, with American electrolytic £2 higher at £132.

Quotations for copper per pound at New York for the week ended July 5 were as follows:

	(For Third Quarter Delivery.)		
	Lake.	Electrolytic.	Casting.
June 29.....	27@27 ¹ / ₄	27@27 ¹ / ₄	24@24 ¹ / ₂
30.....	27@27 ¹ / ₄	27@27 ¹ / ₄	24@24 ¹ / ₂

Tin.—Deliveries of tin into consumption in June were record-breaking, amounting to 6398 tons. The feature of the

deliveries were the imports at Pacific ports, which amounted to 2198 tons, a showing which surprised many trade factors and indicated the extent to which prominent tin plate interests had been importing, as most of the tin arriving at Pacific ports is consigned to Pittsburgh consumers, although during the month it was noted that a considerable amount of Chinese tin was being offered by brokers. The market here was easier, with prices off 1 ct. as a result of the week's downward movement, although on the other side tin was firm, higher and active. The stocks and landing on June 30 totaled 3963 tons, an increase of over 1500 tons. This increase in stocks tended to make the spot market a draggy affair, but consumers are not fully covered on futures and importers are holding up prices as much as possible. Spot tin eased off to 39¼ cts. at the close of June, while at the beginning of the month the price held at 45 cts., thus indicating the extent of the reaction. Straits tin for July delivery was offered at 39¼ cts., with August held at 39 cts. and September to December at 38½@38¾ cts. The difference of only 1 ct. between spot and December tin shows the relative strength of futures and the weakness of spot. The market was practically closed on Monday, while Tuesday was independence day.

Straits tin at London showed a net gain of £1 5s last week, advancing to £175. At Singapore tin advanced £3 15s to £178. Standard tin was also firm during the week, closing £2 higher in spot and £1 15s in futures.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ending July 5 were as follows:

Lead.—Demand for lead has been quite steady of late and prices in the outside market have been firmly held at levels nearer to those asked by the principal producer, and from present indications it would not surprise trade factors to hear of an advance by the A. S. & R. Co. early this month. Foreign and domestic buying took a large amount of metal out of the market. It is estimated that Russia and England took about 2000 tons last week for early shipment, while some rifle ammunition makers are understood to have quietly taken options on large blocks of lead to be exercised in the event of hostilities in Mexico. As has been pointed out war in Mexico would benefit the lead market on the basis of a greater consumption by small arm ammunition makers. Spot lead in the outside market held at 6.85 cts. New York and 6.70 cts. St. Louis, while the June average of the leading interest was 7 cts. New York and 6.92½ cts. St. Louis. Sales for August and September by independents at 6.80 cts. New York were noted. Lead at London eased off slowly last week, but dropped sharply at the opening of the current week. Closing last week at £28 15s for spot and £28 for futures, the market opened this week 15s off in spot and £1 5s lower in futures.

Quotations for lead per pound at New York and per ton at London for the week ending July 5 were as follows:

	New York		London

Lead Ore.—There seems to be little doing in the Missouri-Kansas-Oklahoma district as regards changes in the prices of lead ore. They remained as during the previous week, at \$75 and \$77.50 for 80% metallic lead content. Most of the mines have recuperated from the flood of last week and during the week ended July 1 they were producing normally. There were produced during the week 1,874,990 lbs. of concentrates and this brought the total for the year to date at 55,994,072 lbs., which quantities had respective values of \$71,379 and \$2,493,728.

Zinc Ore.—Attributed to the fact that consumers are not up with their orders and therefore have a supply of spelter on hand, the market for ores in the Missouri-Kansas-Oklahoma district is still on the decline. During the past week prices dropped \$5 and the better grades brought \$85, with the less desirable ores bringing \$60. During the week ended July 1 12,581,430 lbs. of concentrates were produced and the total for the year to that date was 362,306,194 lbs. The respective prices were \$438,911 and \$17,281,280.

Calamine.—The ore continues to be in demand at the decreased figure of \$45@60. Production during the week ended July 1 was given as 65,550 lbs. of concentrates valued at \$1625, and the total for the year was 18,811,270 lbs., valued at \$700,033.

Spelter.—The situation in spelter has developed no change for the better. On the contrary prices have made further recession, but with producers holding a good back log on orders taken when prices were high the declining movement is slow. Little demand has materialized, either from domestic or foreign buyers, and the inertia is furnishing galvanizers with an opportunity to consider securing concessions for future delivery. Galvanizers believe that with spelter below 10 cts. trade in their products could again be resumed. Spelter last week declined slightly over 1 ct., sellers offering spot at 11½ cts. New York and 10¾ cts. St. Louis, with July delivery St. Louis quoted at 10½ cts., August at 10¼ cts. and September at 10 cts. The London market continued to fall, spot dropping £5 to £61 and futures £3 to £53. At the opening of the current week the London market had a

violent break, spot dropping £10 to £51, with futures £8 lower, at £45. As the New York market was dormant, owing to the holiday period, the break at London exerted no repressive influence here, although it is certain that with the resumption of business Wednesday sellers will further readjust prices to lower levels.

Quotations for spelter per pound at New York and per ton at London for the week ending July 5 were as follows:

*For the first nine months; spot market nominal thereafter.

MISCELLANEOUS METALS.

Quicksilver.—The market has held firm at the advanced price of \$80 a flask for spot virgin quicksilver, with some good business done at that price. Domestic consumers were the principal buyers, although a little foreign business came to the surface. The price has now held at \$80 for almost 10 days. There is little disposition to advance the quotation, which is now practically on a parity with the official price of £16 15s at London. Receipts are good and up to requirements of the trade. To a certain extent the known holdings of certain banking interests prevent a decided rise in prices, but speculators had their hands badly burned a short time ago and therefore outside interests are leaving the metal alone.

Antimony.—There appears to be no bottom to which prices for antimony will drop. Chinese and Japanese interests have indicated that they would accept 15 cts. duty paid for July delivery, although their quotation to smaller buyers is 17½ cts. The market is dull, weak, and heavy consumers can secure concessions without difficulty.

Zinc Sheets.—Following the recession in spelter prices on zinc sheets have been lowered, the principal maker now quoting \$18 per 100 lbs., f. o. b. Peru, Ill.

Nickel.—There has been no change of note in the situation. Demand continues fair, with prices as previously, 45@50 cts. for ordinary forms and 5 cts. additional for electrolytic.

Ferromanganese.—English makers brought down their price to \$175 seaboard for the fourth quarter, thus actively competing with domestic furnaces for business. Consumers, however, are showing a preference to domestic producers, owing to the new English restrictions. Users of English ferromanganese must sign an agreement not to export steel made therefrom except to allied countries. As this would seriously hamper trade to South America, consumers are either seeking English alloy already here on which the new restrictions are not applicable, or domestic ferro. Spot English unrestricted was offered at \$225 seaboard, with restricted held at \$200. Domestic furnaces are taking the bulk of the business. The fact that ferromanganese has been successfully produced by merchant furnaces in this country is an achievement that is beginning to stir the English makers who now fear the permanent loss of their trade.

Pig Iron.—Domestic demand for pig iron has been small and unimportant, but foreign business has furnished considerable activity. The export business is mainly for

bessemer iron, but lately inquiries for foundry grades have come from foreign countries. Domestic melters are not interested in covering last half requirements, having carried over a considerable amount of iron from the first half which they could not consume owing to labor shortages. Foundry iron has been offered by resellers at \$14 Birmingham and \$17.50 Buffalo for No. 2, with furnace prices \$1 higher. Bessemer is firm at \$21 valley, with basic held at \$18 valley. W. P. Snyder & Co. report the average price of bessemer in June to be \$21, a slight increase over May, with the basic average at \$18, a slight decrease from May.

Plant Construction of the New Cornelia Copper Co., Arizona

By W. A. SCOTT.

The illustration on following pages represents the scene of the New Cornelia Copper Co.'s operations, as it appeared several weeks ago, at Ajo, Ariz. In the foreground, is shown the machine shop, foundation work for electrolytic tank house, coarse and fine crushing plants, ore bins, power plant, leaching tanks and railroad yards; the low, cone-shaped hills shown in the background contain the ore deposits soon to be attacked by steam shovels. The old town of Ajo, though not in view, is situated on the eastern part of the ore belt. The new townsite of Cornelia is situated west of the plant, and is partly shown in the extreme right of the illustration, which is a view looking south-westerly. The Ajo district lies in one of the most arid regions of Arizona, 42 to 45 miles south of Gila Bend, and is now reached by the Tucson, Cornelia & Gila Bend railroad, auxiliary to the Calumet & Arizona and New Cornelia Copper companies. The elevation of the camp is about 1900 ft. above sea level. As early as 1860 to 1865 high-grade copper ore was mined from these deposits, hauled to San Diego, and shipped thence by water.

The Ore Deposits.

The exposed area of the New Cornelia's deposit here amounts to 65 acres, and appears as a series of connected dome-shaped hills from which all waste or overburden has been eroded away. The deposit consists of monzonite porphyry, containing dikes of diorite and diabase, and bearing copper oxides and carbonates to a depth of 150 to 200 ft., and sulphides in the form of chalcopyrite and bornite at greater depth. The entire area has been explored by diamond drills, the total footage of drill holes thus made amounting to 23,097. Of the 88 holes sunk from 200 to 1000 ft., 19 were bottomed in ore, and by this exploration work it was ascertained that the central ore body extends to a depth of 400 to 600 ft. The holes were sampled every 5 ft., and to check the drill findings many 50-ft. test pits were sunk. An estimate of the amount and grade of ore available, based upon

this prospecting and sampling, is as follows: Carbonate and oxidized ores, running 1.54% copper, 11,950,000 tons; sulphide ores, running 1.50% copper, 28,303,600 tons; making a total of 40,258,000 tons, averaging 1.51% copper. As a result of these tests it is understood the ores contain 0.2 to 0.4 oz. silver and 0.015 to 0.01 oz. gold per ton. The dividing plane between the oxidized and sulphide zones appears to be nearly horizontal.

Leaching and Electrolytic Process.

The property was acquired in 1912, when exploration by surface work and diamond drilling began, and was continued until the data above given were worked out. In the meantime experiments along lines of leaching by sulphuric acid were carried on under direction of Stuart Croasdale, Denver, and demonstrated to be commercially practicable. When, in 1913 and 1914, a patent anode came to the attention of the company, experiments were made with methods of electrolytic deposition, and at the same time an adaptation of the old Hoffman process to leaching was tried, and with some success, all efforts being directed to devising a process of the greatest simplicity. First, a 1-ton plant was built at the property, which was operated several months; and this was supplanted early in 1915 with a 40-ton plant. With the 1-ton plant 413 charges were run, and on the 40-ton plant 301 charges were run, and in the aggregate 14,000 tons of ore were leached. The process finally adopted consisted of crushing to 4-mesh, leaching with sulphuric acid in lead-lined tanks for 8 days by upward circulation, and advancing the solution from tank to tank, the oldest charge getting the solution having a maximum of free acid content, which is approximately 3%. In this manner there is a constant inflow of high-acid solution at one end of the series and a constant discharge of neutral solution from the newest charge of ore. The solution dissolves other material besides copper, consisting principally of iron and alumina, the former as both ferrous and ferric salts. The ferric iron, being detrimental to elec-

trical efficiency, is converted to ferrous iron by reduction with sulphur dioxide gas generated by roasting sulphide ore. This reduction is accomplished by passing the solution down through a tower filled with wooden baffles, the gas passing up through the tower, or in a direction opposite to the flow of the solution. This reduced solution is now sent to the electrolytic tank house, where the copper is deposited out electrolytically. Lead anodes and copper cathodes are used, and the solution flows through the tanks at parallel to the anode and cathode surface. The solution, on leaving the tank house, is run through the leaching tanks, and thus used over and over. To keep down the fouling of solution a certain quantity will be discarded daily and its copper content precipitated on scrap iron. This cement copper will be used as an

ing information pertaining to the construction of a plant of 5000 tons daily capacity, now in progress, will be the more readily understood. The new plant, which it is believed will be ready for operation by January, 1917, is being built and equipped to put into execution the methods so thoroughly worked out in the experimental plants, on ore bodies so well explored and tested.

Thus far, the New Cornelia Copper Co. has placed orders for material and equipment amounting to over \$1,250,000, a large part of such material and equipment having been delivered or is ready for delivery.

Mining Operations.

Mining operations will begin in an arroyo, at a place between two mineralized hills, where three Osgood

Foundations for Power House and Electrolytic Plant.

NEW CORN

additional reducing agent, being brought back into solution with the ferric iron generated in the electrolytic cells.

The anodes and cathodes decided upon will be 42 by 42 ins. and will weigh 175 to 200 lbs. The quality of copper produced by this process, it is claimed, will be somewhat better than the average electrolytic, as there will be practically no arsenic nor antimony in the electrolyte to contaminate same. In the treating of the ore in the experimental plants there was an average content of 1.35% copper, the process showing an average recovery of 80%.

These facts concerning the process, and the equipment required in its operation, were obtained from the company's metallurgical department, and the follow-

100-ton, oil-fired steam shovels will be used in scooping up the ore and loading it into 30-yd. Kilburn & Jacobs, side-dump cars, of which there are 40. The haulage of about one mile from the mine to the crushing plant will be by five 70-ton switch locomotives, furnished by American Locomotive Works.

The New Plant.

The coarse crushing plant will contain a No. 24 motor-driven Allis-Chalmers gyratory crusher, followed by five No. 8 Allis-Chalmers gyratories, reducing the ore to 3½-in. size. It then passes by belt conveyor to storage bins of 10,000 tons capacity, and thence by belt conveyor to the fine crushing plant, equipped with twelve 48-in. Symons disc crushers, by

which the ore is pulverized to $\frac{1}{4}$ -in. mesh, thus making it ready for the leaching plant. Between the fine crushing plant and leaching tanks is a sampling mill, equipped with standard machinery for this purpose.

For the leaching process, 11 lead-lined tanks of concrete are being constructed, each tank 88 ft. sq. and 15 ft. deep, inside measurement, and having the capacity of 5000 tons. These tanks are being set in the open and arranged in two rows, with a central structure between the rows to support the conveyors by which the tanks will be filled with ore. Each tank is being equipped with Worthington pumps for advancing its solution at the rate of 8000 gals. per minute. The tailings, after the copper in the ore has passed into solution and has been drained off, will be discharged from the tanks into side-dump cars by

and circulating pumps. These tanks are being so arranged as to make two main aisles in the building, each 80 ft. wide and 270 ft. long. This structure, already erected, is of steel.

Power Plant.

The equipment, for steam-electric generation, is being housed in a steel and concrete building, 126 by 200 ft., and consists of five Stirling boilers, 823-hp. each, equipped for oil firing, with economizers and feed-water equipment; two 7500-kw. General Electric steam turbines, and three Westinghouse 1500-kw. motor generator sets. The boiler and steam turbine installations will be separated from each other by a partition. This power plant, including building and complete equipment, is under construction by Chas. C.

Oil Tanks. Machine Shop.

Hulett type of excavators, and hauled by locomotives to the tailings dump. In addition to the leaching tanks and their equipment, there will be five wash-water and acid solution storage tanks, each having a capacity of 450,000 gals.; also one sludge tank, 88x88x15 ft.

The four sulphur dioxide absorption towers, each 20 ft. diameter and 40 ft. high, will receive the neutral solution from the leaching plant, to reduce the ferric iron, as previously described, and from those towers it is pumped to the electrolytic plant, for circulation through the electrolytic cells. This plant, called the tank house, is being equipped with 158 lead-lined electrolytic tanks, each tank being about 30 ft. long, 4 ft. wide, 5 ft. deep, having accessories, such as cranes

Moore & Co., Engineers, San Francisco, who have a contract for this important work.

The machine shops and warehouse are contained in one building, so divided as to make a shop room 80x180 ft., and a warehouse 60x80 ft. Modern tools and shop equipment have been installed to handle the special work and repairing required for the entire works.

Water Supply.

A water supply for the plant and for domestic uses was developed, first by drilling, and then by sinking a 650-ft. shaft on the desert 8 miles north of Ajo. A Nordberg, electric-driven pump of 750 gals. per minute capacity was installed and a 10-in. pipe line was laid from this water shaft to steel tanks, of 300,000

gals. capacity, situated on the hill above the plant. The lift required from shaft to storage tanks is 1100 ft. Drifts will be run from the bottom of the shaft to develop a greater water supply, and an additional pump will be placed in service. The water here, though slightly alkaline, is very good, and has a temperature of 102° F.

Oil and Acid Storage.

Oil tanks, already erected, have a capacity of 15,000 bbls., and four tanks for sulphuric acid storage, equal to 150,000 gals., are being built. The oil and acid tanks are so located that they may be filled by gravity lines direct from tank cars. The acid for the leaching plant is to be supplied by the Calumet & Arizona Copper Co., Douglas, where an acid plant, capable of producing 200 tons of acid per day, is under construction. This is auxiliary to the C. & A. smelting plant, where a lead-lined acid chamber, 534 ft. long, 138 wide and 80 high, is being constructed on concrete piers. The acid will be produced from sulphide ores, five of the 24 Herreshoff roasters used at this smelting plant being connected to the sulphuric acid plant.

General and Personal.

General offices and laboratories will be constructed later in the year. A park was laid out and provided with an irrigation system, trees and grass were set, and by the liberal use of water a beauty spot on the desert is in a fair way to be created.

John C. Greenway, general manager of Calumet & Arizona Copper Co., is likewise general manager of the New Cornelia; M. Curley, general superintendent, has direct supervision of all work at Ajo and Cornelia. Fred Eckman, mine superintendent, will direct the steam-shovel operations. The plant was designed by A. G. McGregor, of the C. & A. staff. Geological data and matter pertaining to the ore deposit were worked out by Ira V. Goralemon, of the C. & A. Co. Much of the ore testing at the experimental plants devolved upon H. A. Tobellmann, chemist and metallurgist for the New Cornelia Co. Dr. Morse, of Western Precipitation Co., Los Angeles, spent some time at the experimental plant in the early stages of the research work, in a consulting capacity, and in developing the methods adopted. J. S. Olmstead now holds the position of chief engineer in the New Cornelia's engineering department.

Rich Ore Strike in the Joplin District.

A rich strike of zinc ore is reported from the Joplin, Mo., district on what is known as the Heffernan lease, between Quapaw and Cardin. At a depth of 190 ft. the shaft has been sunk into a body of ore that shows a 16-ft. face of practically pure zinc blende. Only an occasional piece of flint is found in it with the rock that chances to stick to the ore where it joins at the top of the deposit with the rock and at the bot-

tom. The ore is hand sorted for the most part and four hand jigs are used upon the finer particles. With this sort of arrangement there is being made daily from 15 to 18 tons of cleaned zinc blende concentrates. Fourteen carloads of cleaned ore have already been made, and the mine is only being started out from the shaft. It is believed that the ore deposit is the filling of an old underground cave with the ore solutions, which accounts for the absence of the ordinary gangue matter and the high percentage of ore. Nothing like it has ever been found hitherto, and the end is not anywhere in sight. In fact, drilling seems to forecast a very large deposit of this character and the company, which is a Canadian concern, is looking forward to the development of the tract upon a large scale.

Coke-Oven Accidents in 1915.

Reports received by Albert H. Fay, Bureau of Mines, Washington, D. C., from the operators of coke ovens in the United States show a gratifying decrease in the number of fatalities and injuries in 1915 as compared with 1913 and 1914. The number of men killed in 1915 was 38, as compared with 45 in 1914 and 46 in 1913. The total number of men reported employed in 1915 was 31,060, as compared with 22,313 in 1914. The fatality rate in 1914 was 2.02 per 1000, while in 1915 it was 1.22. The injury rate in 1914 was 98.10 per 1000, while in 1915 it was 91.82.

The report represents 248 plants or companies, showing 55,112 ovens in operation, as compared with 49,895 in 1914. There were also reported 98 plants idle. The average number of days active in 1915 was 303, as compared with 286 in 1914 and 288 in 1913. This report gives for the first time separate accident data for beehive and by-product ovens and indicates a greater hazard for the latter than the former.

Treatment of Zinc Ore in Electric Furnaces.—

A difficulty encountered in treating an ore charge in an electric furnace is the formation of crusts of slag or other material in the proximity of the tap-hole. In order to obviate this trouble, Edward S. Berglund, of Trollhättan, Sweden, proposes to add to the furnace at intervals certain easily fusible materials that will combine with the melt and stiff crusts. (U. S. patent 1,160,244.) Thus in the case of zinc ore he adds 200 kg. of fluorspar to a charge of 1000 kg. of ore and carbon, mixing them intimately before charging; or he may add such fluxes as fluorspar, lime and old slag just before the furnace is tapped, introducing the substances in proximity to the tap-hole.

The state department has received from Special Agent Rodgers at Mexico City the following regarding the new mining taxes: "There will be no penalty during whole month of July. Fines will be imposed at rate of 25%, 50% and 100% after August, Sept. 1 and Oct. 1, respectively. Thereafter forfeitures may be declared."

The Metallurgy of the Rarer Metals

In a paper presented before the American Institute of Chemical Engineers, at its Cleveland meeting, Prof. J. W. Richards of Lehigh University discussed the importance and future of magnesium, calcium, chromium and other metals. According to Prof. Richards, there are many metals which may be called the rarer metals, but the most interesting among these, both to the metallurgist and economist, are those metals whose compounds are relatively cheap and which command high prices because of the difficulty of their reduction. These are metals whose market prices may at some time be reduced anywhere from one-half to nine-tenths by improved methods of reduction. He said that if his paper had been written 30 years ago aluminum would be one of the metals that would be discussed, being in 1886 one of the rarer metals selling at \$10 per pound. The silicon industry furnishes another example of great reduction in the cost of the metal. This, in 1900, was selling as a chemical curiosity at over \$100 an ounce; now 10 cts. per pound is a good market price for it.

Beryllium and Boron.—The speaker referred at length to the number of metals that at present command high prices, but which by improved metallurgical processes might be made very cheaply. These include beryllium, boron, magnesium, calcium, strontium, zirconium, molybdenum, barium, titanium, chromium and cerium (mixed metals of the cerium group). He said the present methods of reducing beryllium are tedious and costly and that it is not to be expected that this metal can be made cheaply until some one masters the direct electrolysis of the oxide, dissolved or suspended in a more stable melted salt, which is by no means an impossibility. He said this metal, being white, malleable and unchanged in air, with a specific gravity of 1.64, would make it particularly useful for objects where great lightness and permanence in air are the first consideration, with the cost secondary. He characterized it as a metal that will repay extended metallurgical research and minute physical and chemical study of its many unique properties.

Magnesium and Its Future.—Prof. Richards said that the metallurgist had not made a fraction of the progress that he should have made with magnesium. Although magnesium oxide costs only a few cents per pound, the metal sells for about as many dollars per pound and is scarce. But it is believed that, by improving the methods, the reduction of magnesium can be produced at 25 cts. per pound. He said that while the war lasts, with its enormous demand for magnesium for military purposes, the price will remain in the dollars per pound, but with improved processes that are being developed he believes that after the close of the war, with normal industrial conditions, magnesium will sell at a price which will take it out of the class of rarer metals and put it among the common ones. As the price goes down its industrial uses

will increase in geometrical proportion, and instead of the production being expressed in thousands of pounds per year it will reach thousands of tons. This will be one of the by-products of the war's stimulus to metallurgical industry.

The speaker said that the possibilities held out to the metal industry by reasonably cheap magnesium are extremely interesting, and that it is quite possible that alloys analogous to dur-alumin may be discovered, as strong as soft steel, with only 30% of its weight, which will find extensive use in aeroplanes and dirigibles. Such alloys may largely displace aluminum alloys, which are now used by the thousands of tons annually in the automobile industry, with a saving of one-third in weight, which will compensate for the higher first cost. He predicted that the metallurgical use of magnesium will also be greatly extended by its lower price, such as for deoxidizing brass, copper, bronze, nickel and monel metal, since it is a much stronger deoxidizer than aluminum. In fact, aluminum has blazed the way into numerous uses for which magnesium, as soon as it becomes cheaper, will compete and replace its older sister. He predicted a large future for magnesium as one of the common metals of everyday life.

Calcium in Alloys and as a Deoxidizer.—Calcium, strontium and barium were referred to as the trio of highly interesting elements, common enough in nature but scarce and of high price because of the metallurgical lack of efficient and cheap methods of reduction. Calcium was referred to at present as a semi-rare metal which could be produced much cheaper by present methods if made on a large scale to fill a large demand. The principal trouble at present is in finding uses for the large production. He said its possible alloys with other light metals should be exhaustively studied, and that another large possible use is as a chemical purifying agent in melting and castings metals.

A small addition of metallic calcium might be used to reduce the amount of sulphur and phosphorus in steel, and other metals and alloys whose properties are damaged by sulphur or phosphorus may be similarly refined or improved. Barium was referred to as a metal that could be obtained in large quantities if its uses were developed. As barium is a good conductor, its use was suggested for electrical contrivance, and there are possibilities that its cost can be very materially reduced.

Growing Importance of Chromium.—The fact that the use of chromium in steel is rapidly extending to all varieties of extra hard and high-speed steel was referred to, and the paper stated that the use of pure chromium is limited by its high cost of production and our lack of knowledge as to how to handle it and its possible useful effects. For example, chromium electroplating is white and durable and for many purposes

may be superior to nickel and almost equal to platinum plating, but the technique of always getting perfect plating has not been mastered.

Ferrocromium alloy carrying high carbon (6 to 8%) is produced cheaply in crucibles, cupola furnaces, blast furnaces and electric furnaces. Low-carbon ferrocromium commands three to five times as high a price because of the difficulty of decarbonizing the raw product. The speaker hoped that a test would be made in the electric shaft furnace to see if it is not possible to produce directly from the ore a low-carbon product, and said the present prices—\$100 and \$500 a ton, respectively, for the high and low alloys—would warrant a great effort in that direction.

Prof. Richards stated that the metallurgy of chromium is full of attractive possibilities and the usefulness of pure chromium in the field of alloys is only beginning to be scratched. The scratch, however, has proven very much worth while. The success of A. J. Rossi and the Titanium Alloy Mfg. Co. in producing ferrotitanium alloy from the enormous quantities of titaniferous iron ore in northern New York and Canada was referred to, and the speaker said that if uses are found for pure titanium some other than electric furnaces must be used to reduce it. These methods of reducing pure titanium are, like its prospective uses, still in the future. The metal is now quoted at about the price of silver, and if the problem is properly faced it could probably be made as cheap as chromium.

New Swedish and Norwegian Iron Works.

Iron and steel production in Sweden and Norway, with special reference to the utilization of domestic resources, is receiving special attention, according to the London Times. In Sweden large iron works are now approaching completion at Oxelösund, with the output estimated at 60,000 tons of pig iron annually and about 100,000 tons of coke, in addition to by-products.

In Norway an interesting plan for large iron works has been prepared by a committee of the technical societies, with a minimum output of 50,000 tons per year. It is urged that the plant be located near convenient water power and within 300 km. of Narvia, the Norwegian export harbor for Lapland iron ore. A coke plant is contemplated, using foreign coal, the manufacture of by-products from the coke plant, a complete steel works, a steel foundry and rolling mill. About 125,000 tons of English coal is figured as necessary, as well as a capital of about \$4,000,000. It is advised that plans should be made for an increase in output to 150,000 tons per year, which would supply the present imports of 100,000 tons and leave a margin of 50,000 for export.

Iron consumption in Norway is increasing, while the production has dwindled decidedly, with the export of iron ore growing at the same rate that imports of pig iron are increasing. The projected plant is ex-

pected to be of great advantage to the Norwegian ship-building industries, which are being greatly extended, with new ones being built.

Zinc Exports Continue at Record Breaking Rates.

Zinc exports—pig, bars, plates and sheets—from the United States for the first 3 months of 1916 continue at record-breaking rates, as the following table from Government data shows:

Period.	Gross tons.	Gross tons per month.
1915	111,788	9,315
1914	57,899	4,825
1913	6,957	579
January, 1916	12,512	} 10,559
February, 1916	11,357	
March, 1916	7,808	
August, 1914, to March, 1916, 20 war months	200,617	10,031

It will be seen from this that the average exports for the first quarter of this year of 10,559 tons per month were larger than the average for 1915 of 9315 tons per month. The contrast between the totals for 1913 and 1915, however, is striking evidence of the extent to which this country has displaced Germany in supplying the world's needs for zinc or spelter. The largest exports of any one month since the war started were 17,005 tons in September, 1914, with 16,354 tons in December, 1914, and 13,570 tons in January, 1915. Until October, 1915, the exports then fell below 9000 tons per month and then rose again into five figures.

A very large quantity of zinc has also been exported as brass in bars, plates and sheets. Official Government data gives the following:

Period.	Gross tons.	Gross tons per month.
1915	29,585	2,465
1914	3,176	264
1913	2,728	227
January, 1916	5,332	} 7,537
February, 1916	8,565	
March, 1916	8,715	

The present brass export rate is therefore over three times that of 1915, or 7537 tons per month, against 2465 tons per month in 1915, and only 264 tons per month in 1914.

The valuation of the 1915 spelter exports was \$31,332,395, or \$280 per ton, against \$955,667 for the 1913 exports, or \$137 per ton.

Water in Coal.—"Some Properties of the Water in Coal," by Horace C. Porter and O. C. Ralston, is the title of Technical Paper 113, issued by the U. S. Bureau of Mines. It deals with the manner in which water may be held in coal and how its properties and those of coal are affected by the condition in which it is held. The Bureau has analyzed many thousands of samples of coal from different coal fields and has studied the behavior of coal under the varied conditions which attend its use. The question of its water content is considered of importance in connection with the destructive distillation, the alterations during storage and other phases of the industrial utilization of coal.

The Merits of Oil and Grease Lubrication

By W. J. FOUHY.

The use of oils and greases as machine lubricants is as old as machine practice, but prior to the non-condensing steam engine, which came into practical use about the year 1800, machine practice was not extensive, and prior to the development of the petroleum industry during the last half of the 19th century, animal, vegetable and fish oils and greases were largely the only available lubricants. In fact, the development of this prime mover marked the beginning of an era of industrial advancement; subsequent machine development afforded a means for finding petroleum in abundance; the growing demand for machinery meant a corresponding demand for machine lubricants; the limited supply of the forementioned oils and greases meant a growing demand for petroleum oils and greases, and the development of machinery, and of the petroleum industry, kept pace with each other during the last half of the 19th century.

Machinery and petroleum lubricants are now used very extensively, but in view of the fact that these lubricants are not used efficiently in many instances, it is the writer's purpose to make clear the reasons why free-flowing oils are preferable to hard oils or greases under certain conditions from a lubricating standpoint, and to outline briefly the temperature, structural and operating conditions that justify the use of various greases. In fact, due to the small quantity of grease frequently required by some bearings easily lubricated with hard oil, many young engineers, students and novices, receive the impression that suitable greases afford more efficient lubrication than well applied free-flowing oils. However, careful study of this problem reveals the fact that such impressions are erroneous and misleading in a great measure. In other words, a careful comparison of the composition and molecular construction of these lubricants, and proper consideration of their differences in relation to the difference of power absorbed by "friction" make the error so clear that there is no room for argument.

As a matter of fact, every authority on lubrication, including Prof. Thurston, and numerous experiments made by careful, experienced engineers, prove conclusively that exclusive grease lubrication involves from 3 to 5% more power or "friction load" than suitable oil lubrication of the same assembly of machinery operated otherwise under precisely the same conditions.

Recognition of this advantage of free-flowing oils many years ago by some machine designers and builders, and their desire to build machinery superior to the output of competitors, prompted them to incorporate improved types of bearings in the construction of their output, and improved methods of oil appli-

cation, such as ball-race bearings, ring-oiling bearings, various types of oil bath bearings, and oil circulatory systems of much greater capacity. In fact, the adoption of these improvements of machine design, and improved methods of application meant the prevention of unnecessary oil leakage; more cleanly machinery; more dependable lubrication than afforded by oil-cup feeding, and hand oiling; recovery and repeated use of each filling of oil, and an appreciable reduction of lubrication and other operating costs.

Furthermore, we find that the more copious supply of oil afforded working surfaces of bearings by these improved methods of oil application, also reduces friction as much as 4% more in many instances, especially when supplied under pressure from large circulatory systems. In view of this, it is fair to say that grease lubrication involves fully 5% more friction than oil lubrication of improved modern methods.

In order to illustrate the meaning of 5% more friction, friction load, or more power required with grease lubrication, let us consider the lubrication of a large assembly of machinery. For instance, a flour mill having a full load of 800 hp. when lubricated with suitable free-flowing oils, and equipped with modern oiling appliances. Assume that the required power is developed by a reciprocating engine; that it is scarcely capable of pulling the full load economically with the prevailing speed, and maximum mean effective pressures, and that the owner decides to use grease exclusively in future, and equips his plant accordingly with grease feeding appliances, not being aware of subsequent results. The additional friction load promoted by the use of grease means that the engine would then be required to develop 840 hp. when working the plant at full capacity. This would mean a corresponding increased consumption of fuel. Assuming that the fuel costs average \$34 per horsepower per year, it is evident that the cost of this additional power would amount to \$1360 per annum, or \$113.33 per month, to say nothing about additional fuel cost brought about by inefficient engine operation.

On the other hand, if he preferred to develop not more than 800 hp. in order to obtain the same engine economy obtained while employing free-flowing lubricants, he would be compelled either to return to the use of fluid oils, or to restrict the output of the mill, which would mean reducing the earning capacity, or a loss of profits.

Furthermore, if he desired full output of the mill, and the best engine economy obtainable with grease lubrication, other expensive radical changes, such as either increasing the engine speed, increasing the boiler pressure, or installing a new engine, might be

resorted to. However, in either event, the exclusive use of grease would mean either a great loss of fuel, a corresponding loss of output, or a partial loss of both continuously, regardless of initial expenditures that may be involved.

Evidently, the increased fuel cost, and the loss of earning capacity due to grease lubrication, should be added to the annual, or monthly cost of grease in every instance, when comparing costs of free-flowing, and hard oil lubrication.

A common way to determine the "friction load" of an assembly of machinery is to take power readings while it is running empty or without load, at rated speed. This is accomplished with reciprocating engine-driven machinery by taking correct indicator cards during such an interval, and computing the horsepower developed. With electric motor-driven machinery it can be determined by taking proper switchboard readings during such an interval, and by computing the kilowatts or horsepower required. However, a less expensive and more accurate method of determining the difference of "friction load" or of the power required with the respective lubricants, is to find their "co-efficients of friction" by testing them on a modern friction machine.

The superiority of free-flowing petroleum oils as lubricants, or their lower "co-efficients of friction," is due to their fluidity, and high degree of purity. In other words, these characteristics embrace a molecular construction of hydrocarbons that afford lower "co-efficients of friction" or less internal or molecular resistance than hard oils or greases. Another point of superiority of free-flowing oils is their great durability; that is to say, their fluidity and purity enable them to be readily recovered, filtered, and used over again repeatedly on the same working surfaces without danger of injuring bearings and increasing friction. In fact, in some instances, good, free-flowing engine and machine oils are used over and over again as many as 14,000 times in modern circulatory systems before their lubricating qualities become appreciably impaired. However, this endurance of oil is possible only in cases where such lubricants do not come in contact with critical temperatures, and other injurious influences during service.

On the other hand, hard oils and greases, otherwise known as semi-fluid, and solidified oils, have their proper realm of usefulness or afford dependable lubrication when used in their proper places, and when rightly applied. As a matter of fact, experience teaches that there are prevailing structural and operating conditions, such as certain types of bearings, the presence of grease feeding appliances, heat conditions and exposure of bearings to excessive dust and grit, which make it impossible for free-flowing oils to lubricate as economically and efficiently as semi-fluid and hard oils, and that justify the use of solidified oils even with an expense or loss of power. In fact, such is the case to a limited extent at many cement plants, collieries, ore mills, sugar plants, cotton seed oil mills,

and other industrial establishments. The actual conditions that make grease lubrication desirable at any plant, are excessive surrounding and bearing temperatures; exposure of bearings to excessive dust and grit; the presence of grease cups, and other structural and operating features referred to later. In fact, temperature, structural and operating conditions are so extensive as to require a number of various greases.

Hard oils or greases consist of lubricating oil, and some animal or vegetable product treated in such a manner as to form a sponge or filler capable of absorbing the oil constituent, but some greases are made almost wholly of animal fats, for special purposes.

There are several grades of petroleum greases, and the manufacturers usually make each grade of two or more consistencies. For instance, there are low, intermediate and high-melting point greases of various consistencies for bearing service; special tallow compounds for locomotive service, and more adhesive greases for open gear service, chains and the like. As a matter of fact, each grade has several melting points, each consistency of each grade has its respective melting point, and all responsible manufacturers of lubricating greases rigidly maintain the uniformity of each grade and consistency.

Furthermore, for marketing convenience, each grade has a trade name, and each consistency of each grade or brand also bears a number or some other means of identification in order to place consumers and marketers of these products in position to choose and use them intelligently in accordance with their structural, temperature and operating requirements.

Generally speaking, the quality of a grease depends on the quality of its oil constituent; some grades or brands of grease contain different lubricating oils than others; the softer the consistency of a grade of grease, the more lubricating oil it contains, and the harder consistencies of any grade of grease are usually better suited for high-temperature service than the semi-fluid and softer consistencies of the same brand.

Referring specially to the grades of grease intended for bearings—the semi-fluid and soft consistencies are well adapted for several types of close fitting machine bearings not subject to high temperatures, whether operated at high, intermediate or slow speeds. For instance, ordinary solid and split bearings equipped with properly adjusted spring compression cups; ordinary bearings with pockets affording a large area of journal surface, and roller bearings of mine cars, automobiles and other mechanisms. They are also well adapted for gear-case service where the containers are not reasonably oil tight. This of course is true in every instance where either the clearance space, or the oil grooves are ample to afford proper distribution of lubricant to the working surfaces without promoting excessive leakage, and where the running and surrounding temperatures are not sufficient to cause excessive waste of grease.

However, in every instance of soft grease lubrica-

tion where excessive waste of lubricant prevails, due either to constant high temperatures or to excessive clearance caused by abnormal metallic wear or otherwise, it is advisable to use either the medium or harder consistencies of the same grade if prevention of previous waste is desirable. In fact, in some instances even a consistency of another brand of grease of higher melting point may be required.

The medium and hard consistencies of the low and intermediate melting point grades of grease are also well adapted for the lubrication of ordinary wrist pins, crank pins, eccentrics, knuckle joints and like moving parts, whether or not exposed to excessive dust and dirt, where the motion is such that free-flowing oils cannot be applied adequately, easily and safely without special oiling appliances. In fact machine parts are frequently equipped with suitable compression cups.

The hard consistencies of each grade of grease of low and medium melting points are well suited and intended for bearings where the temperatures are excessive for the softer consistencies. They are desirable lubricants for bearings where the temperatures are sufficient to melt them at the required rate, and in many instances they are well suited for large, slow speed, heavy duty bearings. However, experience teaches that they should be fed from hand grip screw compression cups rather than from spring compression cups, because in many instances their resistance or density is excessive for such springs.

The high-melting point greases are well suited and intended for bearings where the room or surrounding temperatures are excessive for the hard consistencies of the medium melting point grade of grease. They are best applied either from large bearing pockets, or when fed from the locomotive type of grease cups. In fact, in railway shop practice, special greases are compressed to a desired density in special moulds suitable for locomotive driving journals, and for crank pin, and eccentric cups.

The marked distinction of the high-melting point greases is that their sponge is manufactured in a manner to resist greater or more intense heat than that of the medium grades. However, regardless of the grade and of the consistency of a grease, it is the oil that lubricates, and heat of working surfaces equal to its melting point is required to make it sufficiently fluid to liberate the oil constituent, before adequate lubrication can be obtained from it. This fact, which embraces the molecular construction of hard oils, is accountable for their higher "co-efficient of friction."

On the other hand, one of the advantages obtained in practice by the proper application of suitable greases on bearings exposed to excessive dust and grit, is that these harder lubricants completely fill the clearance spaces, prior to melting, and they form a slight fillet at the bearing ends, which prevents dust and grit from entering, increasing friction and injuring the working surfaces, thus protecting these sur-

faces from foreign matter, as well as affording dependable lubrication.

The advantage obtained by using suitable greases instead of free-flowing oils on bearings subject to high temperatures, is simply the economy of lubricant attained by the prevention of waste of free-flowing lubricants. However, this advantage can be easily reversed in cases where the construction of such bearings is favorable to adequate oil recovery, where they can be supplied from a circulatory system, and where the construction and capacity of the system can be made suitable for required oil cooling. In fact, in such instances, it is advisable to use heavy-bodied free-flowing oils instead of grease, providing the maximum temperature of the working surfaces does not greatly exceed 150° F.

Antimony Imports for April Show Large Increase.

The report of the Bureau of Foreign and Domestic Commerce for April shows that the imports of antimony (matte, regulus or metal) during that month amounted to 2,984,600 lbs., which total shows substantial increase over the returns reported for the previous month and the same period a year ago, viz., 1,202,150 lbs. and 662,995 lbs., respectively. Imports of antimony ore were 982,851 lbs., which compares with 803,097 lbs. imported in March and 297,721 lbs. in April, 1915.

The monthly imports of antimony for 1915 and to April this year are as follows:

	1915		1916	
	Ore.*	Metal.	Ore.*	Metal.
January	231,200	2,239,553	660,309	89,600
February	1,040,336	448,634	2,246,623
March	76,608	986,164	803,097	1,202,150
April	297,721	769,949	982,851	2,984,600
May	229,001	1,516,127
June	117,600	1,446,979
July	118,195	2,439,601
August	772,691	661,030
September	109,015	2,320,412
October	131,906	439,413
November	250,066	617,598
December	1,040,009	3,006,868
Total	3,374,012	17,484,030	2,894,941	6,522,977

*Antimony contents.

To assist in a practical way those who are now exploring twenty townships in northern Wisconsin for iron ore, as the result of the examination last year by the Wisconsin Geological Survey, W. O. Hotchkiss, State Geologist, Madison, has prepared blueprints showing each of these townships, with magnetic lines, roads, streams, etc. So much activity in ore exploration has not been known in Wisconsin for many years. most active explorers and has leased considerable The W. D. Edison Co., Duluth, Minn., is one of the acreage on the royalty basis. Drilling will start July 1.

Higher wages to the right kind of miners does not mean an increased cost of production; on the contrary it means probably a very material decrease in this item.

Operating Motor Trucks Under Difficulties at Mines.

The Duquesne Mining & Reduction Co. has been using a Knox 4-wheeled tractor with a trailer to transport ore and concentrates from the mine at Duquesne, Ariz., to Patagonia, the nearest railroad connection, 18 miles distant. This equipment operates in the reverse direction over the same road to transport mining supplies of all kinds, including a large amount of new machinery, being installed in connection with the work of developing the mine.

Some idea of this 18-mile stretch may be had from

trailer load also rolls on broad, practically indestructible steel tires. The power wheels of the tractor itself, as shown by the illustration, are equipped with diagonal steel cleats that insure traction.

The complete success of motor equipment under such an unusually severe test would seem to indicate that the gasoline motor will be a permanent and important factor in getting ores from the mine to the railroad.

Manganese Ore in Colombia.—It is reported that an American syndicate has opened a manganese ore mine at Madinga, on the Gulf of San Blas, in the Province of Colon, Colombia, and that a trial ship-

ONE OF THE 64 TIMES FORDING THREE CREEKS DURING THE 18-MILE TRIP.

the fact that it took 3 days for a 10-mule team to make the round trip of 36 miles, hauling 3 tons of supplies on the trip to the mine and returning with a 7-ton load. To complete the comparison, it is said that the tractor covered the same 36-mile round trip in 10 hours, hauling 4 tons on the trip to the mine, and $8\frac{1}{2}$ tons on the return trip, at an estimated saving of over 48%.

The hauling has been done under the direct supervision of S. R. Montgomery, of the Knox Motors Associates. The loads varied considerably, but experience proved that an average of 10 tons per day could easily be made. The tractor hauled as much as $5\frac{1}{2}$ tons up, and 10 tons down, with the same apparent ease as when lighter loads were taken. The record of tonnage hauled shows an average of 369-ton miles over a period of six successive days, with a record for one day of 459-ton miles.

The 18-mile haul is over one of the worst roads in the state, including the famous Jigger hill and the equally well-known Rocky hill, both of which have pitches in excess of 20%, with ledges of rock crossing the road diagonally, to complicate the problem of traction. Part of the way there is no road, making it necessary to follow up Creek canyon. Three different creeks have to be forded 64 different times.

The tractor is steel shod throughout, and the semi-

ment of some 900 tons of the ore was made recently to New York. Shipments of 1500 tons a month are anticipated if vessels are available for the purpose, and a wharf at deep water has been built near the mine.

NEAR SUMMIT OF ROCKY HILL.

A History of the Homestake Mine, S. D.

By RICHARD BLACKSTONE *

The title, Homestake Mine, will be used to cover the present belt of consolidated properties, the Homestake, the Highland, the Golden Terra, the Deadwood, and the Father De Smet mines. These locations adjoin each other and extend northwesterly in the order named. The Homestake mine and the Highland mine were separately incorporated and organized, but operated by the same superintendent, the Golden Terra, Deadwood and Father De Smet each having its own superintendent and manager.

In the fall of 1875 gold was found in paying quan-

an arastra, which they ran the following winter, 1876-77, and took out \$5,000. The Manuel brothers and Hank Harney located the Golden Terra on Bobtail Feb., 1876, just north and over the hill, and in the spring, 1877, they sold the Golden Terra claim to John Bailey, of Denver, and the Durbin brothers, of Cheyenne, Wyo., for \$35,000. Then they bonded the Homestake to California parties for \$40,000 and the Old Abe to Woosten brothers for \$5,000. Mose Manuel in 1876 put up a 10-stamp mill and bought a half interest in Guinn's saw mill. He ran the ore through this

HOMESTAKE PROPERTY TODAY, SHOWING AMICUS AND GOLDEN STAR MILLS, NEW B. & M. SHAFT AND ONE STACK OF NEW POWER PLANT.

ties on Deadwood creek. The discovery was made a little below the mouth of Blacktail gulch and claims were staked above and below discovery, extending from De Smet mine to Deadwood. In April, 1876, Mose Manuel, Fred Manuel, Hank Harney and Alex Eng found some rich quartz float on the ground later known as the Homestake. When the snow melted they located what they called the Homestake mine taking only 75 ft. on each side of the center of the crevice, this on the 9th day of April, 1876. They started to dig a discovery shaft on the side of the little draw and the first chunk of quartz that they uncovered weighed about 200 lbs. and was the richest in gold ever taken out. They ran a big open cut and saved the best quartz by itself. Afterwards they built

mill and also furnished ore to all the other mills in the neighborhood. The bond on the Homestake had expired and no sale. When Fred Manuel and Hank Harney came back from Chicago in the spring of 1877, Mose had so improved the property that they concluded it was worth much more money than the bond called for and that they would not sell for any such figures. George Hearst came up one day and wanted to get a bond on the Homestake and they agreed on a price of \$70,000 for 30 days. A few days later Capt. Urin came up and offered them \$45,000 for the Old Abe claim, which they accepted. Both bonds were completed and the money was turned over within the limits of the bonds. The Homestake claim was only 150 ft. wide, 75 ft. on each side of the crevice, and 1350 ft. long, containing 4 2-3 acres. The Golden Star claim containing about 9 acres was bought at the same

*Superintendent Homestake Mining Company; abstracted from Pahazapa Quarterly.

time. The south end of the Homestake was located at the north side of the Brick store and just south of the 80-stamp mill. These two claims constituted the whole property of the Homestake Mining Co. at the time it was incorporated.

The northerly 150 ft. of the Homestake and Golder Star claims were previously sold to C. H. Enos and others and constituted what was known as the segregated Homestake. This property was operated through

HOMESTAKE ELLISON HOIST.

a tunnel starting in the draw in the westerly line of the Golden Star claim and extending easterly into the ore under the heavy porphyry capping. The ore from this property was mined in large galleries in drifts generally without timbers and hauled by wagon to the Enos mill, which stood where the Homestake assay office now stands. This property was bought in by the Homestake Co. and closed out all adverse interests in the main ore body over on the Deadwood-Terra side. The Golden Terra extension and the Gopher locations were made between the Highland claim and the Golden Terra on the grounds that the Ophir location was illegal by reason of its discovery shaft being within the lines of the Golden Terra claim. This brought about a hard fought trial in the courts for the possession of this piece of the main ore ledge and it was awarded to the Golden Terra Extension and Gopher parties. These claims soon after the decision were bought by the Highland and Golden Terra companies and the line of division between these two properties was fixed and marked.

The Homestake Mining Co. was incorporated Nov. 5, 1877, with J. B. Haggin, Thomas Bell, William Willis, Lloyd Tevis and R. P. Lowns as directors. The principal owners were J. B. Haggin, George Hearst and Lloyd Tevis. An assessment was levied of \$200,000 to develop the property and build a mill. An 80-stamp mill was ordered from the Union Iron Works at San Francisco, Calif., to be shipped by Union Pacific railroad to Sidney, Neb., then in wagons to Lead. The tramway level at the top of the mill was extended up into the ore and open cut mining was started. The Star shaft was then sunk into the incline of the vein and in the ore from the ore shoot, which has ever since been known as the Incline ore. A vertical shaft was sunk 400 ft. north from the Star hoist to the

100-ft. level, which was only 75 ft. below the tramway. This shaft passed through the porphyry hanging-wall, struck into the ore at the 100-ft. level and a crosscut disclosed 240 ft. of ore to the slate foot wall.

Ore Bodies.

The great masses of ore extended above a plane through the tramway level and from 150 to 200 ft. above that plane up to the porphyry capping, all gold-bearing and with very little covering of debris or loose material, practically uncovered and ready for the quarry man. Gold ores to yield less than \$8 per ton by amalgamation on plates were not considered worth looking at by the California miners, and they came here with no advanced knowledge or experience and began to work along the same lines, digging out the high-grade ore and leaving ore carrying, say \$3 or \$4 per ton as not profitable.

Gravity Mining and Haulage.

The Homestake open-cut system was simple and gave millions of tons of good ore at a minimum cost of mining. The system of open-cut stoping underground was first inaugurated in the Deadwood Terra mine on ore shoots comparatively narrow, from 50 to 100 ft. wide. A foot-wall draft was run 25 to 50 ft. away from the ore and shoveling holes were cut into the ore piles at short intervals. Into these the ore was block holed to suitable size to be loaded into cars, being shoveled off of plates or boards. The foot-wall had considerable dip at this level and the ore came down the incline readily to the shovelers.

The hoisting is still done in the old-fashioned way by running the loaded ores (1 ton capacity) on the cages, hoisting to surface and then hand tramping to dump into crushers. Double-decked cages are used in

HOMESTAKE NO. 2 CYANIDE PLANT.

the B. & M., Ellison and Highland shafts, the B. & M. takes one car on each deck, the Ellison takes two cars on each deck, or four tons to one trip. Gates No. 6 gyratory crusher is the standard crusher and all rock crushing done is at the shaft where the ore is hoisted, dropping into the bins on the tramway, where the ore is drawn through gates into the tramway cars and hauled to the mill bins. When the original mills were built, Blake jaw crushers were put in on the

top floor of each mill and the run of the mine sizes of ore were dumped into these crushers. The wear and tear on the ore bins, cars and mill timbers was very great, and with the coming of the Gates gyratory they were all taken out and scrapped for their cast iron. The change of crushing from the mills to the shaft made it possible to excavate bins in solid rock with concrete and steel fronts and gates, greatly lessening the wear and upkeep cost.

Stamp Mills.

The Homestake 80-stamp mill and the Father De Smet 80-stamp mill were built by the Union Iron Works in the same year, 1878. The Homestake mill was arranged back to back, two rows of stamps, 40 on a side, with one line shaft in the center under the ore bins, belting both ways to cam shafts. The mortars were of the wide pattern with back coppers and chuck blocks in front, under the screens. Stamps weighing 800 lbs. and dropping 85 times per minute. The quantity crushed by this mill for the first year was about 5200 tons per month, or two tons per stamp per day, and was regarded as good work. The average gross yield of the ore to Jan. 1, 1879, was \$9.60 per ton. The amalgamation was upon a single copper plate 10 ft. long and under and overflow traps were used at the foot of each table, in which much of the amalgam escaping from the plates was settled and uncovered. Possibly one set of traps in the main tailing sluices constituted the whole of the gold-saving appliances. The ore was in the highest sense free milling. Ores milling \$8 to \$10 showed a loss of about \$2 per ton in

the tailings. On clean-up days, usually the first and fifteenth days of the month, the entire mill was hung up, the mortars were opened up, all of the dies were taken out and the battery sand taken out and panned or run through a rocker to recover what amalgam there was loose in the bottom of the mortar. Front

MOTOR AND 10 CARLOADS OF ORE IN HOMESTAKE.

and back coppers were cleaned and plates were scraped with chisels. Almost an entire day was devoted to the clean-up of an 80-stamp mill, while under the present-day practice there is no stopping of the mill, but only a small section is hung up daily for cleaning chucks and renewal of shoes and dies.

Concentration was not employed, as repeated assays of the sulphurets showed that their average value was but little above that of the ore from which they were derived. Later, when concentrating on blankets and carpets was undertaken, values up to \$15 and \$18 per ton were obtained, but was largely amalgam escaping from the mills and lodging in the fiber of the blankets. Hundreds of tons of these concentrates piled up below the Homestake mills, but were in reality of no value, as no method was known at that time by which the value could be recovered. These concentrates lay in a heap until the D. & D. smelter at Deadwood began pyritic smelting, when they were sold for their gold contents. When the smelter created a market for sulphides jigs were built and hundreds of tons were recovered and sent to the smelter. At this period the cyanide process was being exploited mostly in South Africa and experimental work being done to prove its adaptation as a commercial solvent of gold from its ores. Patented processes crowded the whole field of mining, and for several years it looked as if little progress could be made in the simplifications of cyanide solution methods.

Rapidly the application was worked out. Simpler and more effective methods of oxidization by means of compressed air were installed. Gravity sizing, through cones, made the passage of solutions through the sands constant and uniform, making the cyanide treatment to be as reliable and certain as any other portion of the metallurgy. The present monthly sum-

A TIMBER STOPE IN THE HOMESTAKE.

mary of metallurgy of Homestake is, operating 1020 stamps, crushing 131,497 tons, recovered by amalgamation \$410,501, or \$3.122 per ton; regrinding \$6110, recovering \$0.046 per ton; cyaniding slimes \$57,104, recovering \$0.434 per ton; cyaniding sands recovering \$88,943, or \$0.677 per ton. Total recovery \$562,658, \$4.279 per ton. Total loss \$31,249, or \$0.238 per ton. Approximate total ore value \$593,907, or \$4.517 per ton.

Statement of product and dividends paid by the companies now consolidated in Homestake Mining Co.:

Metal Recovered from Scrap and Drosses.

The value of the copper, lead, zinc, tin, aluminum and antimony recovered in the United States from scrap skimmings and drosses in 1915 was \$114,304,930, against \$57,039,706 in 1914, a 100% increase. This large gain, says the U. S. Geological Survey, was caused by greater recoveries and much higher average values for all metals. A large demand for metal products, particularly for those to be exported, made 1915 the most prosperous year in the waste metal trade.

The imperative demand for zinc and copper by munition manufacturers and for foreign trade made spot metal very scarce. Secondary metals not desired for these purposes were generally available for domestic uses when virgin metal could not be purchased for prompt delivery. The incentive of high prices caused all metal wastes to be more carefully saved, segregated and refined.

The output of secondary copper, including that in brass and other alloys, was 196,000 tons in 1915, against 128,000 tons in 1914. The value of this copper and brass amounted to more than \$70,000,000.

The secondary lead recovered in 1915, including that in alloys, was nearly 79,000 tons, an increase of 28,000 tons, a quantity exceeded by the primary do-

mestic output of only three states—Missouri, Idaho and Utah.

The amount of secondary zinc recovered in 1915 was 92,575 tons. At least 4000 tons of zinc chloride and 46,000 tons of lithopone were manufactured. The zinc used in these products is derived mainly from zinc drosses and skimmings.

The output of secondary tin increased from 12,447 tons in 1914 to 13,650 tons in 1915, and was equal to 24% of the tin imported as metal or as oxide into the United States.

The average price of antimony was abnormally high and the secondary recoveries in 1915 amounted to 3102 tons, valued at \$1,811,568, an increase in quantity of 355 tons, and in value of about \$1,367,000.

Aluminum was both scarce and very high priced the latter part of 1915 and the secondary metal recovered, 8500 tons, was valued at \$5,802,000.

Flotation of Minerals.

A method for effecting the flotation and separation of oxidized ores from the gangue with which they are associated is embodied in the recently issued U. S. patent (No. 1,180,816) issued to Raymond F. Bacon of Pittsburgh. The oxidized ores are first converted, in a finely divided condition, into sulphides by the action of a soluble sulphide, such as hydrogen sulphide, and then the ore is subjected to any of the familiar

METHOD FOR FLOTATION OF MINERALS.

processes for effecting the separation of sulphides from gangue.

In the drawing 1 indicates the vessel in which the ore and water is received, and which may be provided with a rotary propeller or stirrer, 4. Suitable pipes, 2 and 3, are provided for the introduction of the ore and oil (where oil is used), and a pressure gage, 5, is provided for indicating the pressure within the vessel. Hydrogen sulphide is generated at 6 and forced into the vessel, 1, under a suitable pressure by means of the pump, 7. From the vessel, 1, the treated ore is discharged through the outlet pipe, 8, to the flotation tank or cell, 9, which may be of any suitable type.

Necessity for Water Power Development

By HENRY J. PIERCE.

Everyone agrees that the sole reason why our water powers are held back from development is because congress has failed to provide suitable legislation permitting their development.

It seems almost unbelievable that an enlightened government like ours should not only fail to encourage, but should blindly bar the way to, the development of a great natural resource so important to the interests of the country and so necessary to national safety. The fault is not with private enterprise. As has been shown, Americans have repeatedly tried, but in vain, to get the right from our government to establish hydro-electric plants upon navigable streams or within the government domain upon fair and equitable terms that would justify the risk and the large expenditure of time and money involved, while fully protecting the public interest.

They have been met by impracticable conditions which no prudent man could agree to. Prevented by the laws and policy of their own country from engaging in developing a great natural resource of incalculable value to any country possessing it, they found in other lands the welcome for their enterprise and capital denied to them at home. And so Canada and Norway are now enjoying the advantages of American energy, enterprise and capital in the successful establishment and operation of great manufacturing plants involving the expenditure of many millions of dollars and giving steady employment to thousands of men.

The production of hydro-electric energy is a hazardous business. Cost of installation is difficult to determine in advance, and often costs more than anticipated. Floods sometimes destroy dams and power houses, and yet men of business and of technical and scientific experience, who have made hydro-electric development their life work, as well as manufacturers of all of the great products for which the hydro-electric energy would be used, stand ready to undertake the development of our now wasting water powers and the other vast commercial features connected with it as soon as our present impossible federal laws are corrected to a fair business basis, under which practical men will give their time and capital will invest.

The internal development of a country must precede its external commerce. In every one of the 20 years ending with 1913 the foreign commerce of Germany has exceeded that of the United States, and the excess has been steadily growing greater. For the single year 1912 it was \$853,000,000, and for the whole 20 years it was \$7,700,000,000. There is nothing in that record for the United States to be proud of, even if the two countries stood somewhere near on equality. But we have an area 17 times as great; we have 30% more population; we have nearly three times the ac-

cumulated wealth, and our natural wealth and our natural resources are 20 times greater than those of Germany.

Then why not give those who would develop our wasting water powers the right to work, the right to build and expand and develop, the right to help create a greater and more powerful industrial nation? Why not give them a law to work under which shall encourage and not hamper their just activities?—a law which, while placing them under the constant supervision of the public authorities, and sufficiently safeguarding every public interest, yet shall be of such a fair and businesslike nature that under its operation men may hope for a generous return for their work and risk, and capital be assured of a safe investment.

Reasonable, sensible, practical regulation safeguarding the public interest no one objects to. The trouble is that the federal policy covering the use of water power is so narrow, so full of restrictions, so loaded down with conditions that no prudent man will venture to embark in the business.

There are some who would place a federal tax upon water power. Coal and oil used to produce power are not taxed, then why tax turning water into power? Why place burdensome legislative restrictions upon developments so necessary to the advancement of the nation?

The belief that any law that congress may enact will be eagerly accepted by would-be water power developers and the investors upon whom they are dependent for the means of developing is a delusion, and the sooner it is abandoned the better will be the opportunity for obtaining legislation based upon business principles and business experience. The investor must know in advance the conditions under which he is to conduct his business, and federal water power laws should specifically define the terms and conditions under which permits for use of government property necessary to the development of water powers shall be issued. This is just as necessary to the guidance of ever-changing heads of government bureaus in conducting the affairs of their departments as it is to those who would invest their money in the development of our water powers.

To be of effect, federal legislation governing water power development must be of a nature to protect the public interest, be fair and businesslike toward capital, and place not a featherweight more burden on the operation of water powers subject to the control of the federal government than is borne by competing hydro-electric developments not subject to federal control. There is no reason why these things should not be so co-ordinated upon a solid business basis as to protect every interest and bring results.

Thus it is apparent that there is vital and impera-

tively urgent necessity for the enactment of practical federal water power legislation of a character which will promote and encourage in every way the development and utilization of the enormous quantity of energy latent in our streams and now wasting to the sea; a necessity in no way local, but national. It is necessary for the development of our mineral industry; necessary for the manufacture of fertilizers; necessary for the electrification of railroads for the cheap carrying of freight, and to provide a means of rapid and comfortable transportation for the people; necessary to the irrigation of vast tracts of lands, meaning the building of thousands of homes on lands now silent; necessary to the establishment of great and entirely new industries in the United States, meaning the investment of hundreds of millions of dollars, the building of new cities and towns and the employment of thousands of men and women; necessary if we are to maintain our commercial standing among the manufacturing nations of the earth; necessary in order that coal and oil may be preserved for the use of future generations; and finally, of vital necessity toward promoting the safety, the comfort, the welfare and the prosperity of every citizen of the United States.

A New Hand-Operated Resuscitation Device.

A new hand-operated device for the resuscitation of victims of drowning, electric shock, mine accident, collapse and asphyxiation by poisonous gases is known as the Type "B" pulmotor. This machine is practically nothing more than a valve with indicators for measuring both inhalation and exhalation pressures. Interposed between a pump or oxygen cylinder and the patient's lungs, it measures, regulates and registers the exact pressures, both of inhalation and exhalation, exerted in the lungs. The operator does not attempt to regulate the volume of air exchanges or the rate of respiration; these are all controlled by the patient's lung capacity, just as in natural breathing. The operator simply moves the valve lever handle to right or left for inhalation or exhalation when the indicator gauges show him that the proper and natural lung pressure of either inhalation or exhalation has been reached.

When the lever handle is at the extreme right, air or oxygen from a pump or cylinder passes through the pulmotor valve in a controlled flow to the patient's lungs. As they fill to their normal expansion, their resistance is registered in the inhalation gauge. By watching this the operator can tell when to move the lever to the extreme left for exhalation.

This closes the direct passage to the lungs, and the air from the pump escapes through a by-pass in the pulmotor valve, drawing with it the air in the lungs, thus gently assisting them in their natural collapse. As they deflate, their action is accurately measured in the exhalation gauge. By watching for the indicator in the gauge to come to rest, the operator can know when to move the lever for the next

inhalation. These operations are continued until the patient is strong enough to breathe without assistance.

The smaller the patient's lung capacity the more quickly will his lungs fill, and the more quickly will the indicators reach their minimum point of travel. Hence the more rapidly must the lever be moved and respirations caused. This is entirely in accordance with nature, and is in itself a convincing demonstration of the naturalness of the respirations produced.

The pressure gauges perform another valuable function—that of signalling the operator when and how the patient wishes to resume breathing. If he should attempt to inhale, the indicator in the exhalation gauge will move to the right and center. If he should attempt to exhale, the indicator in the inhalation gauge will move to the right and away from the

HAND-OPERATED RESUSCITATOR.

center. By watching the indicators the operator can continue to assist the patient until he is well on the road to recovery. Yet even if the operator did not work the machine in harmony with the patient, the latter could resume breathing of his own accord while the mask is on, and independent of the operation of the machine. It is impossible to suffocate or gag the patient, or injure the lung tissues by failing to operate the machine properly.

In order to make the Type "B" pulmotor available for every conceivable use it is provided with two milled headed escape valves; one for inhalation, and one for exhalation. By adjusting these, the operator can obtain instantly and hold any combination of inhalation and exhalation pressures the case calls for regardless of the efforts of the man at the pump.

The machine which weighs only 12 lbs., with all accessories, and costs \$115, and is expected to find its greatest field as a supplement to the standard pulmotor. Its compactness and portability make it ideal for emergency work.

Reopening the San Juan, in Graham County, Arizona.

The San Juan, one of the old, historic mines of Arizona, located in the early eighties, has been taken over by a syndicate, headed by F. W. Estabrook, a director of the Miami Copper Co. The twelve claims, comprising the group were originally located by a woman, who had come out to Arizona from the east and prospected in the Lone Star Mining district. She was able to interest eastern capital and a company was formed, which resulted in a partial development of the claims, the deepest work being prosecuted to 335 ft. with a little over 1500 ft. of lateral work. Records show that this company shipped over \$385,000 worth of ore, but owing to the then slump in copper and disagreement between the stockholders and

mountains running northwest and southwest. The principal formation in the section being diorite, the strike is nearly east and west. The copper occurs principally in the monzonite and in the fractured and blended zones of the diorite and monzonite, the monzonite being of later origin. The surface and outcroppings show very much copper carbonate. Various old shallow workings show strong evidence of copper leaching. An examination of the logs of the drill holes bear strong evidence of copper leaching and precipitation of copper, light in iron. The mineralized area, other than the brecciated is cut and intersected with small veins and veinlets, some of which are rich in copper contents.

The new management, under the superintendency of E. Walker, immediate representative of the Estabrook Syndicate, will continue development by churn drilling, and will also continue the shipping of the

THE SAN JUAN COPPER PROPERTY IN GRAHAM COUNTY, ARIZONA.

the management of the mine, operations suspended and the property was worked only in a spasmodic manner, until 3 years ago, when extensive churn drilling was carried on. It is estimated that by this drilling over 1,000,000 tons of milling ore, averaging 3.67% copper has been developed. Last February the property was secured from the old company by T. J. Sparkes, R. W. Craig, Gus Hirschfield and J. C. Adams, all of Phoenix. Louis A. Dunham, who figured prominently in the sale of the Inspiration property, near Miami, and the Ray Con., at Ray, promoted the transaction between these owners and Estabrook Syndicate. During the short time the above mentioned owners had the property 19 cars of ore were shipped to the Calumet & Arizona smelter at Douglas.

The San Juan has the largest known deposit of copper ore in Graham county. It is located at 4100 ft. elevation and lies at the base of a high range of

carbonate ore. The possibilities of the mine are variously estimated at from \$10,000,000 to \$20,000,000. With the present tonnage and its possibilities there is every reason to believe that the San Juan will very shortly be added to the list of Arizona's best coppers.

The Federal Mining & Smelting Co., which recently acquired the North Star-Triumph mines, near Hailey, Idaho, has begun a 300-ton daily capacity concentrator, with flotation system and electric separator, for treatment of North Star-Triumph ores. The mill at the Federal Co.'s Morning mine at Mullan, Idaho, is being enlarged, and as soon as the additional equipment is ready for service the output will be increased.

The application of preservative compounds to wood by immersing it in them or by pouring or brushing them upon it is the basis of the wood-preserving industry as it is developed today.

What the Mining Companies are Doing

North Butte, Montana.

According to its report to the assessor of Silver Bow county, Montana, the North Butte Mining Co.'s net profits for the year ending June 1 were \$1,229,339, or \$2.86 per share on 430,000 shares.

From the company's quarterly reports it is safe to estimate the copper production for the 12 months to June 1 at not over 22,000,000 lbs. Costs as per the report to the assessor were \$3,873,912. This would indicate a cost of 18 cts. per pound, except that it is customary in Butte to credit gold and silver recoveries to the operating account. For the period under review precious metal yield was probably \$900,000. The net cost per pound of copper, after crediting gold and silver, therefore, was apparently 13½ cts.

For the year ended June 1, 1913, the company showed net profits of \$1,613,046, treating 451,297 tons of ore. The metal then averaged around 16 cts. For the year just ended it earned \$1,229,339 in the treatment of 495,275 tons of ore on a metal market which must have averaged at least 18 cts. A very much lower grade of ore explains some of this poor showing.

The following report was issued to the county assessor of Silver Bow county:

	1916.	1915.	1914.	1913.
Tons ore mined.....	495,275	262,615	463,437	451,297
Total yield	\$5,103,252	\$2,583,071	\$5,020,372	\$5,219,151
Mining cost	2,079,484	1,163,963	1,831,839	1,896,549
Transportation	61,154	31,548	46,494	53,741
Cost reduction	1,733,274	993,536	1,784,452	1,624,816
Total costs	3,873,912	2,249,331	3,726,365	3,606,105
Net profits	1,229,339	333,739	1,294,006	1,613,046

Trimountain Mining Co., Michigan.

The Trimountain Mining Co., incorporated under the laws of Michigan, has filed with the Massachusetts secretary of state a statement of its financial condition, dated March 31, 1916, which we compare as follows:

	1916.	1915.
Assets—		
Real estate	\$ 803,000	\$ 803,000
Stock of Michigan Smelting Co.....	110,000	110,000
Copper and supplies.....	438,138	492,909
Cash and debts receivable.....	785,015	84,850
Construction	1,859,332	1,859,332
Total	\$3,995,486	\$3,350,092
Liabilities—		
Capital stock	\$2,000,000	\$2,000,000
Accounts payable	73,813	33,571
Surplus	1,921,672	1,316,521
Total	\$3,995,486	\$3,350,092

Braden Copper Co.

In its application to list its stock on the New York Stock Exchange the Braden Copper Co. makes the following statement of its profit and loss account for the 15 months ended March 31, 1916:

46,822,116 lbs. copper sold at 19.356 cts.....	\$9,063,212
Operating cost	4,501,048
Net profit	\$4,562,164
Total net after miscellaneous income	\$4,618,626
Interest credits	609,777
Total	\$5,228,404
Interest debits	1,628,427
Balance	\$3,599,977
Less discount on bonds.....	1,350,000
Balance	\$2,249,977

The company has 2,800,000 shares assuming conversion of \$8,000,000 bonds.

Pope Yeatman, consulting engineer, on Jan. 1, 1915, estimated the mine contained 113,694,880 tons of ore, assay value 2.84% reduced to 2.5% with allowance for dilution in mining. He estimates value of copper contents on 14-ct. copper market and an 80% mill extraction, a 95% smelter extraction and a 6½-ct. cost of production, delivered to European markets (under normal conditions all the Braden production is sold

abroad) as \$324,030,408, and the life of the mine 32 years, with a plant capacity 10,000 tons of ore per day.

There were milled during the first quarter of 1916, 371,852 tons of 2.15% ore, and the production was 12,802,898 lbs. of copper at average cost of 9.67 cts. per pound. Net earnings were \$1,940,783.

Plant is being increased to 10,000 tons daily capacity. When in full operation it is estimated this plant will produce 136,800,000 lbs. of copper per annum, which would yield annual profits of \$10,260,000 on 14-ct. copper, \$12,996,000 on 16-ct. copper and \$18,468,000 on 20-ct. copper. At present rate of production net earnings exceed \$500,000 per month. Company employs at its properties in Chile 1500 to 1800 men.

Anaconda Co., Montana.

The report of the Anaconda Co. to the assessor of Silver Bow county, for purposes of taxation, for 12 months ended June 1, shows net earnings of \$14,363,881, against \$6,468,439 last year.

Report for the past 3 years follows:

	1916.	1915.	1914.
Ore mined, tons.....	4,946,061	3,311,488	4,714,653
Gross proceeds	\$59,334,085	\$29,608,184	\$39,464,004
Total mining cost.....	20,466,854	13,304,562	17,816,505
Cost of transportation....	1,234,773	690,553	1,405,558
Cost of reduction.....	10,092,566	6,352,895	8,057,896
Cost of marketing.....	4,460,581	2,791,743	3,570,478
Total costs	\$44,970,204	\$23,130,745	\$30,850,439
Net proceeds	14,363,881	6,468,439	8,613,564

*Includes \$8,715,428 spent for improvements.

Calumet & Hecla Properties.

The May outputs of the Calumet & Hecla and subsidiary mines compare as follows (in pounds of copper):

	May.	April.	March.	5 mos., 1916.
Ahmeek	2,070,551	2,158,451	2,175,930	9,180,272

Wilbert Mining Co., Utah.

The report of the Wilbert Mining Co. for the year ending May 1, 1916, shows cash on hand amounting to \$42,467.61 and total receipts of \$251,939. Disbursements totaled \$209,472. The report follows:

Receipts:	
Cash on hand May 15, 1915.....	\$ 3,342.06
Ore sales	223,382.27
Boarding house	24,368.51
Miscellaneous receipts	846.86
Total	\$251,939.20
Disbursements:	
General expense	\$ 2,097.20
Mill operating expense and supplies.....	33,267.29
Mine operating expense and supplies.....	69,338.55
Ore hauling	43,188.05
Boarding house expense and supplies.....	23,293.91
Office and management.....	4,342.00
Insurance	2,357.46
Assaying	520.50
Tailings test	120.00
Taxes	837.10
Mill watchman	110.00
Dividends	30,000.00
Total	\$209,472.09
Cash in banks.....	42,472.61
Total	\$251,939.70

Manager Knight says in part: "During this period we have milled 15,204 tons of ore assaying 25% lead and 3.86 ozs. silver. From this was produced, by sorting and concentration, 5787 tons of product assaying 52.06% lead and 8.02 ozs. silver. In metal contents this represents 6,025,600

lbs. of lead and 46,419 ozs. silver. Since our mill first went into operation in 1912 we have been impounding our tailings and have now accumulated some 30,000 tons. The cost of extraction has been \$54,579.07, or \$3.56 per ton. In the assets the mill is placed at \$65,000, mine plant at \$50,000 and boarding house at \$2500."

Trethewey Silver-Cobalt Mine, Ont.

The balance sheet of the company as of Dec. 31, 1915, shows as follows:

Assets—	
Mining property at cost.....	\$ 880,004.50
Buildings, plant and equipment, less depreciation....	121,246.50
Investments	15,321.32
Supplies on hand.....	8,766.70
Unexpired insurance	2,913.45
Accounts receivable	26.75
Cash on hand and in bank, less deductions.....	97,476.92
Total	\$1,125,755.64
Liabilities—	
Capital stock	\$1,000,000.00
Unclaimed wages and accounts payable.....	2,438.28
Unclaimed dividends	2,644.45
Balance at credit of revenue account.....	120,672.91
Total	\$1,125,755.64

The operating account shows as follows:

Receipts—	
Gross returns from ore sold, less charges.....	\$ 3,682.58
Gross value of silver unsold, less charges.....	38,476.34
Interest	1,711.57
Rentals from cottages.....	344.30
Total	\$44,214.79
Disbursements—	
Mining	\$13,314.27
Mill operation	7,229.62
Shipping and marketing charges.....	427.28
Insurance	2,576.27
Miscellaneous expense	120.00
Mine office expense.....	1,569.62
Camp maintenance	4,203.06
Superintendence and engineering.....	2,375.00
Taxes and licenses.....	127.77
Head office and administration.....	5,819.85
Carried to revenue account.....	6,452.04
Total	\$44,214.79

Miscellaneous Company Notes.

During May, 1916, the total production of the Goldfield Con. Mines Co. was 32,400 tons, from which resulted net realization of \$50,693; 2658 ft. of development work was performed, at a cost of \$5.59 per foot.

At the Greene-Cananea Copper organization meeting of directors J. W. Allen was elected secretary, to succeed F. R. Kennedy. Mr. Allen will continue as treasurer. E. J. Dudley was chosen assistant secretary at New York, and J. W. Neukom was made assistant secretary at Duluth. J. B. Cotton, general counsel.

The Nipissing Mines Co. made \$200,000 in May, a high record. It was during that month that the sensational advance occurred in silver prices, on the crest of which Nipissing made substantial sales at 77 cts. an ounce. When silver prices touched 66 cts. Nipissing sold 50,000 ozs. at that level without any difficulty.

At the Greene Con. Copper Co. annual meeting Dr. L. D. Ricketts was elected director to fill vacancy caused by the death of S. E. Searle. At subsequent meeting J. W. Allen resigned as director and Walter Douglas of Phelps, Dodge & Co. was chosen to succeed him. Mr. Allen will continue as secretary and treasurer. Retiring officers were re-elected.

The United Verde Extension Mining Co. has declared an initial quarterly dividend of 50 cts. a share, payable Aug. 1 to stock of record July 15. In a letter to stockholders, directors say in part: "We are now shipping to smelters in Arizona, at considerable distance from Jerome, over 70,000 tons ore per month, which has been averaging about 20% copper, resulting in net profits of about \$350,000 a month for several months past. These earnings are due in part to the prevailing high prices for copper. Cash on hand as of this date is \$793,882; there is due us from ore shipped approximately \$1,000,000, making a total of \$1,793,882. Although we have

this surplus available, it has been decided to accumulate larger surplus for purpose of developing the property and constructing necessary reduction works."

The Shannon Copper Co. earned approximately \$100,000 on its June operations when its usual 1,000,000 lbs. of copper was produced. The cost of producing per pound of copper was 16.6 cts. and the average selling price was 26.6 cts., leaving a profit of 10 cts. per pound. Production during the 6 months of 1916 totaled 4,404,000 lbs., from which net earnings of \$420,000 were realized. The company has now a net working capital of about \$1,000,000, which compares with \$555,000 on Dec. 31 last.

At the recent meeting of Kennecott directors a statement was submitted showing cash and copper on hand as of July 5, all of which copper has been sold, amounting to \$18,037,000. This is after disbursing approximately \$1,200,000 for dividend of \$1.50 per share, for quarter ending June 30, 1916. The above figure includes dividend of \$1,213,000 received from Utah Copper Co. June 30, but does not include Kennecott's interest in cash and copper on hand of Braden Copper Mines Co., or Utah Copper.

East Butte Copper Co.'s June production will amount to about 1,500,000 lbs., the same as in the 2 previous months. For the first half of 1916 the company's output will have totaled 6,661,000 lbs., or at the rate of 13,000,000 lbs. per annum, against an 18,000,000-lb. rate for the past 3 months. June earnings should be in the vicinity of \$200,000, although it is difficult to forecast with accuracy because East Butte settles for its copper on the basis of the average price the week it arrives in New York.

Dividends on the \$2,000,000 8% preferred stock of the Colorado Fuel & Iron Co., which has declared a 30% dividend on account of accumulated payments, were omitted from 1903 to 1911, inclusive. In 1912 2½% was paid, and in 1913 4½%, while the first semi-annual dividend of 4% was paid in 1914. No dividends have been paid since until the present declaration. Total dividends due for the period from 1903 to July of this year were 108%, of which 78% will have been paid on Aug. 15 next, making the balance accumulated on the preferred stock 30%.

The balance sheet of the Consolidated Interstate-Callahan Mining Co. as of March 31, 1916, as filed with New York Stock Exchange, shows net current assets amounting to \$771,000. The company earned \$812,782 net for the quarter ended March 31, 1916; for the year ending same date net was \$3,309,321, or \$7 per share on the 461,990 shares outstanding, which have been listed on the New York Stock Exchange. The company's ore reserves amount to 350,000 tons, sufficient on basis of present operations to last for more than 3 years. Extraction during 1915 was 113,795 tons of ore, averaging 28.4% zinc.

The Quincy Mining Co., it is estimated, will earn \$1,540,000, or \$14 per share, in the half year ended June 30. In the same period the company will have paid two dividends totaling \$7 per share on its 110,000 shares. Production for 6 months to June 30 will approximate 11,000,000 lbs. turned out, at an average cost of 11 cts. a pound, and sold at an average price of 25 cts. This does not include delivery of copper sold at highest prices, as the metal sold several months ago at 29 cts. will be delivered during July. On June 30 Quincy paid a quarterly dividend of \$1, which was the 112th disbursement to stockholders since the company was formed in 1848.

The East Butte Copper Mining Co. in its annual statement filed with the tax authorities at Butte for the year ending June 1 shows gross value of 240,120 tons of ore mined, \$4,505,700; net profits, \$1,070,069; gross value per ton, \$18.76; cost per ton for mining, \$4.73; total cost of mining, \$1,136,057; reduction cost, \$1,011,497; deductions for smelter losses, \$845,708; freight, refining and selling charges, \$122,090; cost of improvements, \$14,278. The Pittsmtont mine yielded 16,124 tons of first-class ore, valued at \$2,141,880, and 126,127 tons second-class, worth \$1,643,568. The Dutton mine yielded 13,400 tons first-class ore, valued at \$364,722, and 26,269 tons second-class, valued at \$330,991.

**New Revenue Bill Would Place Heavy
 Toll on Copper Producers.**

Copper producers will be called on to pay a heavy tax if the general revenue bill just introduced into Congress is enacted into a law. The section affecting producers of copper provides for a graduated tax on the gross receipts from the sale of refined copper or copper alloys as follows: In excess of \$25,000 and not exceeding \$1,000,000, 1%; exceeding \$1,000,000 and not exceeding \$10,000,000, 2%; exceeding \$10,000,000, 3%.

There is no denying that the present high price of copper is the result of the European war, but there is no expectation of a continuance of such prices for the metal. This is surely reflected in the low prices for standard copper mining stocks, which are earning large incomes. At the same time the expectation of a tax on smelter outputs means just so much decline in profits and is not a very good argument for any further increase in dividends.

By examining the following figures it can readily be seen that such companies as Anaconda, Calumet & Hecla, Inspiration, Kennecott, Nevada Con., Ray Con. and Utah Copper would never be called on to pay less than 3% of their gross receipts, notwithstanding a substantial decrease in present prices.

The figures as published show in what way the tax would fall upon various producers, with copper at 25 cts. and 15 cts. a pound, respectively:

	Copper at 25c.	Per share.	Copper at 15c.	Per share.
Ahmeek	\$ 125,000	\$.60	\$ 75,000	\$.37
Allouez	50,000	.50	30,000	.30
Anaconda	2,250,000	1.00	1,350,000	.60
Calumet & Arizona	600,000	1.00	360,000	.60
Calumet & Hecla	562,500	5.50	337,500	3.37
Copper Range	300,000	.75	120,000	.30
Inspiration	900,000	.80	540,000	.50
Kennecott	1,275,000	.40	765,000	.25
Miami	375,000	.50	150,000	.20
Mohawk	60,000	.60	36,000	.36
Nevada Con.	600,000	.30	360,000	.18
North Butte	125,000	.25	75,000	.18
Old Dominion	175,000	.60	100,500	.33
Osceola	100,000	1.00	60,000	.60
Quincy	100,000	1.00	60,000	.60
Ray Con.	515,000	.30	350,000	.20
Utah Copper	1,425,000	.90	855,000	.45

It will be noted that, with the exception of Calumet & Hecla, the tax with copper at 15 cts. per pound would make little impression on earnings per share, but with copper at 25 cts. several companies would have to pay the government close to \$1 per share earned, Calumet & Hecla topping the list with a tax which would be the equivalent of \$5.50 per share on its 100,000 shares outstanding.

From Butte comes word that all Montana is protesting against the tax on copper, and commercial bodies, banks and individuals are flooding Washington with telegraphic protests against the tax and the classification of the copper industry with the manufacture and sale of munitions. Vice-President Kelley of the Anaconda Co. declared proposed law was unquestionably a discrimination against the copper industry, would amount to \$3,000,000 on Anaconda Co. alone, and on normal copper market would amount to more

than 10% of total net income of company. He says company is ready to bear its just share of taxes or war revenue, but protests against being singled out and made to carry a load out of all proportion to other industries of like character.

Employers Exemplify True Patriotism.

The patriotism of employers of labor was never more clearly demonstrated than in the voluntary offer of continuing the wages of those of their employes who responded to their country's call in its time of need, and further announced that the position of these men would be held open to them on their return. It was certainly a commendable act and should be the means of bringing capital and labor into a closer union.

Among the foremost with announcements along these lines were those from companies allied with the mining industry, employing thousands of men. The United States Steel Corporation was among the first with the announcement that men in its employ who are already in the military service and to those who contemplated enlistment, so long as they remain in the military service of the country, will receive their present salary or wages until otherwise ordered. Independent steel companies took like action, among them being the Bethlehem Steel Co., the Carpenter Steel Co. and others. Other lines have been equally as prompt in making a similar announcement.

Among the hundreds of metal mining companies that have made provisions for their employes is the Homestake Mining Co. of Lead, S. D., which, in keeping with its established policy of guarding and providing for the welfare of its employes, both in connection with the discharge of their duties and in their social and domestic life, has announced a plan by which employes will receive pay while engaged in military service, incident to the hostilities with Mexico. This applies to all men who have been in the employ of the company for 3 months.

Alaska Society Condemns Actions of Delegate in Congress.

We are in receipt of a copy of a set of resolutions adopted at a recent meeting of the Alaska Mining and Engineering Society at Juneau, Alaska. After citing the efforts of various societies to secure a passage of a bill by Congress "to provide a commission to codify and suggest amendments to the general mining laws," the society proceeds to take the following rap at James Wickersham, delegate from Alaska:

Whereas, The Hon. James Wickersham, delegate from Alaska, who also appeared before the House Committee on Mines and Mining, chose to attack the personalities of these engineers, as well as their honesty and motives, and through his abuse and ribaldry brought the people of Alaska into ridicule and contempt, now, therefore, be it

Resolved, That the Alaska Mining and Engineering Society assembled at Juneau go on record as expressing its earnest disapproval of the tactics adopted by the Hon. James

Wickersham, and to express also a feeling of humiliation at being represented in Congress by one whose chief method of argument against the bill was personal abuse.

P. R. Bradley is president of the society, G. T. Jackson vice-president, R. J. Wulzen secretary-treasurer. The executive committee consists of P. R. Bradley, C. E. Davidson, G. T. Jackson, John Richards, B. L. Thane and R. G. Wayland.

Lake Mine Officials Predict Iron-Ore Shortage.

One of the possibilities in the very near future is a famine in Lake Superior ore. Despite the fact that a new record of 8,450,000 tons of ore moved in May, the weekly consumption of ore is in excess of the weekly rate of delivery from Lake iron regions.

According to advices from the Lake region, Lake carriers are now delivering ore at the rate of about 54,000,000 tons for the season, which closes Oct. 15, but they will have to do 10,000,000 tons better to carry the industry over the year if consumption holds at the present rate. This is the only difficulty for the mines can produce the ore when wanted.

The American blast furnace industry has been running for nearly 3 months at a rate of 40,000,000 tons of pig iron. It takes on an average 1.9 tons of ore to produce a ton of pig iron, which would mean an ore consumption in 12 months, allowing for no increased production of iron, of 72,000,000 tons. Ore men include some allowance for increase in depleted reserves and call it 75,000,000 tons. Of this 75,000,000 tons of Lake ores will represent probably 85%, or from 61,000,000 to 64,000,000 tons.

As a result of the enormous premiums it has received for its high-grade spelter, the New Jersey Zinc Co. has been able to distribute unusually large dividends to its fortunate shareholders. With the payment of the extra 10% dividend on July 10 and the regular quarterly dividend of 4% on August 10, the company will have distributed this year a total of \$52 a share, or a total of \$18,200,000 on its \$35,000,000 capital stock. During the first 6 months of 1915 dividend payments totaled 50% on its then capital stock of \$10,000,000. Directors a year ago declared a 250% stock dividend and the capital stock was increased to \$35,000,000. The company stands at the head of the concerns manufacturing oxide of zinc and this constitutes its principal product. The rise in zinc carried with it all by-products, and as a result the company has been reaping extraordinary profits. The company also puts on the market the highest grade of spelter—the Horsehead brand—which has sold as high as 40 cts. a pound, against a quotation of about 8 cts. a pound in normal times.

The labor problem in the carrying out of large mining operations frequently presents many serious aspects. The mere getting together of a certain number of men is of but small importance as compared to the question of efficiency.

PERSONAL.

A. F. Duggleby is superintendent of the Juragua Iron Co., Santiago, Cuba.

A. H. Gracey, operating gold properties near Nelson, B. C., has removed to Oatman, Ariz.

T. R. Van Campen, superintendent of the Beatson mine, Latouche, Alaska, has left for New York.

Lyon Smith has accepted a position as metallurgist with the Snyder Electric Furnace Co., Chicago.

M. B. R. Gordon is in charge of development work for the Boulder Mining Co., Rice Lake, Manitoba.

W. C. Browning, general manager of the Magma Copper Co., Superior, Ariz., is in Salt Lake City, Utah.

George Farish, mining engineer, New York, has returned from inspecting properties in Nevada county, California.

B. MacDonald, mining engineer, announces the removal of his offices from Los Angeles, Cal., to El Paso, Texas.

Charles W. Harkison has accepted the position of chief engineer for the Boise Rochester Mining Co., Atlanta, Ida.

E. M. Haug has become a member of the engineering staff of the Tonopah Extension Mining Co., Tonopah, Nev.

Walter A. Fitch, general manager of the Chief Con. Co., Eureka, Utah, has returned from a visit to Houghton, Mich.

L. O. Kellogg is on his way to Ecuador, where he will be superintendent for the South American Development Co.

T. A. Miller, mining engineer with the Cleveland Cliffs Co. at Ishpeming, Mich., has been visiting at Houghton, Mich.

T. P. O'Malley of Butte, Mont., will leave shortly for South America where he will have charge of a mining property.

J. G. Parmalee, Pullman, Wash., has accepted a position as underground surveyor for the Stewart Mining Co., Kellogg, Ida.

Andrew Engles, master mechanic of the Shattuck at Bisbee, Ariz., is at his old home, Lake Linden, Mich., on his vacation.

Nelson A. Reinert, representing the H. A. Riedel Investment Co., mining brokers, Denver, Colo., was a Chicago visitor this week.

Daniel Harrington, mining engineer with the U. S. Bureau of Mines, is in Butte, Mont., investigating health conditions of the district.

Harrison A. Dunn, Michigan College of Mines, who was reported to be in a prison at the Mexican capital, is at his home in Los Angeles.

T. C. Denis, provincial superintendent of mines, Montreal, Quebec, has been released from military service and is again active in his former position.

V. M. Archibald, chief engineer for the Canadian Con. Co. has returned to Trail, B. C., from a trip including the larger cities on the Pacific coast.

M. W. Lee, Duluth, Minn., president of the Marsh Mining Co., Wallace, Ida., is now in Spokane, Wash. He will visit California before returning.

J. E. Spurr, consulting engineer for the Tonopah Copper Co., Tonopah, Nev., is superintending the opening of company property near Schist lake, Manitoba.

James A. Lannon is now general superintendent of the Atlas Mining & Milling Co., Ouray, Colo., having been appointed to fill the vacancy caused by the resignation of W. P. Cary.

A. G. Maxwell, formerly with the Randfontein, is now consulting metallurgist for the General Mining & Finance Corporation, Johannesburg, South Africa.

Ernest Klepetko of the engineering staff at the Washoe smelter made a brief stop at Houghton, Mich., while returning with his bride from New York to Anaconda.

President R. M. Edwards of the Franklin, South Lake, North Lake, Indiana, and Algomah Company has returned North Lake, Indiana, and Algomah companies, has returned

J. N. McLeod, an engineer and assayer, formerly in business at Denver, Colo., is now with Smith, Emery & Co., San Francisco, in charge of their mining department.

N. C. Whitten, mill foreman formerly in charge of the flotation plant of the Anaconda Copper Co., Great Falls, Mont., is now with the Cerro de Pasco Copper Co., Peru.

Robert W. Thompson, formerly assistant secretary of the American Mining Congress, has been commissioned quartermaster of the First Illinois Field Artillery with the rank of captain. He served in the Philippine campaign as first lieutenant in the First United States Infantry.

Carl J. Trauerman, mining engineer, has resigned the position of mill superintendent for the August Mining Co., Landusky, Mont., and is inspecting the properties of the Beaver Creek Mines Co., of Zortman, Mont. After examining mines in the Kendall, Elliston and York district of Montana, he will return to his headquarters at Butte, Mont.

OBITUARY.

A. R. Kenner, mining engineer, Chicago, was drowned at Nevada City, Cal., on July 5, 1916.

SCHOOLS AND SOCIETIES.

Columbia School of Mines.—Prof. Raymond has been in the Michigan Copper Country with a class of students visiting the different points of interest.

Case Scientific School.—Professor Thos. Bains has been conducting a number of students through the mines, mills, and smelters in the Lake Superior Copper district.

Montana State School of Mines.—The Alumni Association recently held a meeting at Finlen hotel, Butte, Mont. This was one of the regular monthly gatherings and many interesting and instructive talks were given by members of the alumni. Prof. Art E. Adami, who accompanied this year's graduating class on a trip to Alaska, gave a very interesting lecture on the methods of mining and milling in the far north. He explained in detail the workings of the larger companies in that district. Emmet Cullity, who spent some time in Canada inspecting the newer mining districts, told of his experiences in that country. The meeting was in the nature of a smoker and in the future it is proposed to have papers pertaining to the mining and metallurgical industry read by various members of the alumni.

Massachusetts Institute of Technology.—The announcement is made of the establishment of a new school of chemical engineering, which is expected eventually to develop means of making this country independent of foreign nations in the production of chemical supplies. The school will include regular courses with a resident professor at five or six industrial plants, each equipped with a fireproof research laboratory. These stations are to be located in Somerville, Mass., Bangor, Me., Niagara Falls, N. Y., Allentown, Pa., and New York or Chicago. The course, which leads to a master's degree after five years of study, includes 3½ years at the institute, nine months at the several industrial plants and the last nine months in the institute laboratories. The school will be opened in time for registration in September.

Progress Made in the Manufacturing Industries

Beyer Barometric Condenser.

The Ingersoll-Rand Co. is now offering complete steam condensing plants for all service conditions. This equipment includes the Beyer barometric condenser, for which the company has secured the patent rights, Imperial duplex and Ingersoll-Rogler straight line, reciprocating, dry vacuum pumps and, where required, Cameron simplex and centrifugal pumps.

The Beyer barometric condenser is of the counter-current type, in which air and cooling water flow in opposite directions. The steam inlet is at the bottom of the condensing vessel, the water inlet above and the air removal opening at the top. The sheets of cooling water overflowing the pool at the inlet point meet the entering steam. The two are

SECTIONAL VIEW OF BEYER BAROMETRIC CONDENSER.

brought into intimate contact by conical baffle plates assisting the water to absorb to its full capacity the latent heat of the steam. The non-condensable air liberated in the condensing action rises through the falling water to the removal point at the top, being cooled to practically the temperature of the incoming water. Ample opportunity is given for the removal of the air content of the water before it mixes with the steam. This the manufacturer points out not only facilitates the mixing process but permits the removal of air and vapor at a comparatively low temperature.

The steam inlet is of large diameter to secure low velocity and is hooded in such a way as to discharge the steam into the center of the condensing vessel. The air removal opening is also of ample area and is protected by a self-draining baffle and trap. This, it is said, positively prevents water being carried over into the vacuum pump.

The hot waste water is discharged through the self-draining tail pipe. This pipe straddles the hot well and rigidly supports the condenser.

The Imperial and Ingersoll-Rogler vacuum pumps are high-speed reciprocating machines, wholly enclosed, and automatically lubricated.

When a water pump is required to elevate cooling water

to the condenser head Cameron pumps are provided. These may be either reciprocating or centrifugal as desired. Where the level of the cold well is of sufficient height above the hot well, the condenser will lift its own cooling water.

The manufacturer in presenting this equipment brings out the point that the vacuum and water pumps, being independently operated, can be regulated to suit varying water temperatures and conditions, and that this plant, in addition to its efficiency in general service, is admirably adapted for duty as a central condensing unit serving a number of prime movers.

TRADE PUBLICATIONS.

Boiler Scale and Accessories. William B. Pierce Co., Buffalo, N. Y. Booklet; pp. 20; illustrated.

This booklet is entitled "The Logic of the Dean," and is intended primarily for the management of the plant, although it contains information of unusual value to the chief engineer or his assistants. The booklet, besides describing and illustrating the operation of the Dean cleaner, discusses the scale problem in detail. Some of the subject headings are: The Formation of Scale Cannot Be Prevented; The Relation of Scale to Fuel Consumption; How Shall Scale Be Removed; Some Things That Compounds Will and Will Not Do.

Loaders for Motor Trucks and Cars. Lee Loader Co., Chicago. Catalog; pp. 18; illustrated.

Views in themselves are given as sufficient explanation of the method by which the loaders operate. Several loaders are used and these may be filled while the truck is on its trip. On arriving the contents of the loader is dumped directly into the truck in 30 seconds. In this way the time required to shovel the truck full is saved and may be used by the truck in making a trip instead of waiting. For the greater part the catalog is given over to discussing tabulated data on cases where the loader is and is not used, the efficiency in dollars and cents being eventually arrived at.

Magnetic Separation Magnets. A. H. Kidney, M. E., Orange, N. J. Circular; pp. 4; illustrated.

It is stated that the rapid, clean and automatic discharge of the magnet makes it possible to determine what percentage of an ore is made up of magnetic materials. The magnet is of the horseshoe type and each pole is constructed with angled stop-grooves. There is also a composite sheath with conducting and non-conducting sections; a flat-loop spring attached to the composite shield; two channel-guides, having insulated recesses, are connected with the loop spring; and a tension-disc and finger piece is attached to the inner top circle of the loop spring. All parts are adjustable, and the magnets are made $5\frac{1}{4}$ by $2\frac{1}{2}$ ins. and 8 by 4 ins. They are of use in the laboratory or field, and for cleaning shop sweepings or bench waste.

Soot Cleaners. Vulcan Soot Cleaner Co., Du Bois, Pa. Booklet; pp. 91; illustrated.

The greater portion of the booklet is given to a general treatise on the inefficiencies caused by soot accumulations. Tests with specific data and results obtained are given and accompanied with both sectional drawings and illustrations, and the question which is brought up at that point is thoroughly discussed. The booklet was published because of the rising importance of the soot question and no available textbook on the subject. The seven sections are as follows: What Soot Really Is; Why Clean Heating Surface Pays; How Soot Cleaning Can Be Accomplished; Design of the Vulcan Soot Cleaner; The Cleaner Applied to Different Types of Fire-Tube Boilers; Vulcan Cleaners Applied to Economizers; Details of Construction of the Vulcan Cleaner. The frontispiece is a four-color reproduction of specimens of soot from different boilers and with different fuels.

INDUSTRIAL AND TRADE NOTES.

The Hercules Powder Co. of Wilmington, Del., paid its regular dividend of 2% on June 24, together with an extra of 13%.

Owing to increased business, it has been decided to double the capacity of the plant of the Utah Ore Sampling Co. at Murray, Utah. The present capacity is 500 tons a day.

The United Copper Co., operating 6 miles from Chewelah, Wash., has just purchased a Jefferey four-wheel drive motor truck. It will be placed in commission at once.

On July 1 the Seattle office of the Lidgerwood Mfg. Co. was removed from its present location, 807-809 Western avenue, to its new quarters at 63-65 Columbia street.

Engineers of Western Precipitation Co., Los Angeles, are at Northport, Wash., designing precipitation installations for the smelting plant at that place, being the Cottrell electrical precipitation process.

Dredge No. 15, built by the Yuba Construction Co., San Francisco, for Yuba Con. Goldfields, at Hammonton, Cal., began operating July 5. This dredge has 100 17-cu. ft. buckets, will dig to a depth of 80 ft. below water level, and will handle 10,000 cu. yds. of material in 24 hours. Its design represents the latest ideas in dredge manufacture and utility.

The Joseph Dixon Crucible Co. advises that those employees who had joined the National Guard prior to its being called by the President and subsequently sworn into the federal service in June, 1916, will receive full pay while away doing military duty. These men will have their places kept open for them. This provision holds good until future developments make it necessary to change it or modify it.

The executive departments of the Western Electric Co. at New York have been moved from 463 West street to new offices in the Telephone & Telegraph building at 195 Broadway. The move was made necessary by steady growth of the company's distributing and engineering and patent departments, which will occupy the space that has been vacated. The change also brings the firm's executive departments in closer touch with the heart of New York's business district.

The United Verde Copper Co., Jerome, Ariz., has ordered equipment for sinking a three-compartment shaft from the 1,000 level. It is to consist of an Allis-Chalmers mechanical hoist, with Westinghouse electrical equipment. It is described as a geared double-drum hoist, driven by an electric motor set, adapted to receive alternating current, and to furnish direct current to the hoist motor and controlling apparatus. The hoist will have a speed of 1900 ft. per minute, and will be capable of operating to a depth of 3000 ft. It will carry seven-ton skip loads and will operate in balance.

Lane Mill & Machinery Co., Los Angeles, is having a good run of sales of the Lane slow-speed Chilean mills and other equipment, among which may be mentioned the following: To the Royal Exploration Co., Stemple, Mont., a complete 20-ton amalgamation plant; a 40-ton amalgamating plant to Alaska-Peerless Gold Mining Co., operating near Juneau; a 20-ton cyanide plant to Cavallero Hermanos, Arequipa, Peru; a 10-ft. Lane mill to a South African agency, for use in Rhodesia; a 40-ton amalgamating plant to H. H. Kelly, Quincy, Plumas county, Cal., and an order from Hallidie Machinery Co., Seattle, for an Idaho mine.

Pacific Tank & Pipe Co., San Francisco, is handling the largest volume of business in its history this year, its products being shipped all over this country and to South America, China, Japan and Honolulu. F. W. Schmitz, manager of this company, states that to meet increasing de-

mands, a new factory, for manufacturing tanks and pipe, is being built at Oakland. The new equipment will be housed in four buildings of mill construction, on pile foundations, each structure to be 125 by 225 ft. The site secured for this purpose embraces 30 acres. A force of 400 men will be employed at the new plant.

An automatic pulmomotor for resuscitation has been put on the market by the Draeger Oxygen Apparatus Co., 422 First avenue, Pittsburgh, Pa. A feature of the apparatus, aside from its light weight, 12 lbs., is the use of valves with indicators to measure the inhalation and exhalation pressure exerted in the lungs. It is explained that the operator does not attempt to regulate the volume of air exchanges or the rate of respiration, these being controlled by the patient's lung capacity just as in natural breathing; instead he simply moves the valve lever handle either to the right or left for inhalation or exhalation when the gages show him that the proper and natural lung pressure for either case has been reached.

NEW PUBLICATIONS.

Further Experiments on the Volatilization of Platinum. By G. K. Burgess and R. G. Waltenberg. Washington, D. C., Bureau of Standards. Scientific Paper 280; pp. 9; illustrated. For sale by Mining World Co., 15c.

This investigation consists of a series of observations on change of weight of several platinum crucibles of various degrees of purity when subjected to heat at 700, 1000 and 1200 C. Determination of the loss in iron content from heating and of other materials soluble in hydrochloric acid were made, as well as some tests made with hydrofluoric acid to detect silica. The investigations are continuations of those already made by Burgess and Sale.

Strength and Other Properties of Concrete as Affected by Materials and Methods of Preparation. By R. J. Wig, G. M. Williams and E. R. Gates. Washington, D. C., Bureau of Standards. Technologic Paper 58; pp. 172; illustrated. For sale by Mining World Co., 45c.

This paper gives conclusions drawn from about 20,000 tests as to the effect on the properties of concrete and Portland cement mortars of varied conditions and constituents of fabrication. The value of knowing thoroughly the constituents is emphasized, and methods of proportioning and graduation are discussed. With the percentage of the cement to the total aggregate fixed the strength was found to vary as to the density of the mixture.

An Interlaboratory Photometric Comparison of Glass Screens and of Tungsten Lamps, Involving Color Differences. By G. W. Middlekauff and J. F. Skogland. Washington, D. C., Bureau of Standards. Scientific Paper 277; pp. 21. For sale by Mining World Co., 20c.

The national standard of light has been maintained by the Bureau of Standards since 1909 by means of four watts per candle carbon filament lamps. The paper transmitted herewith covers an investigation of the variations in results which might be expected in various laboratories. The agreement may be considered remarkable in view of the difficulties and the different characteristics of the observers and the wide difference in methods employed.

Valuable Minerals; How to Find and Know Them. By Arthur J. Burdick. Gateway Publishing Co., Beaumont, Cal. Book; pp. 44; illustrated. For sale by Mining World Co. 50 cts.

In a very elementary way it is pointed out what things the prospector should look for or others should look for in seeking minerals. These very elementary phenomena, indicative of minerals, are followed by descriptions of more specific tests which may be used to determine more exactly what the mineral is and of what value it may be. For the greater part the tests are based on the physical characters of the rock or mineral noticed and in some few cases blowpipe tests are given as well as mineral association.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Anchorage.

The Happy Valley Coal Co. has been incorporated and capitalized at \$50,000. The principal interests in the company are David Gross, R. M. Aistrop and J. R. Uhl, all of this city. The main office of the company is also in this city and they expect to take advantage of the leasing of coal lands recently passed on by the government.

The railroad from Matanuska Junction to Moose creek is about completed. Coal for the Commission is being mined at Moose creek and will soon be brought out over the new road.

Cordova.

McKinley Lake gold quartz property, owned by Charles Canavan, was bonded by George C. Hazelet for a sum said to be \$100,000. The property consists of 10 claims, 18 miles from here and 3 miles from the Copper River & Northwestern railroad. It has been held for years by local people.

Dawson.

Thomas Aitken has sold his Silver King group of gold properties to Manley, Ives, Price & McGinn, who will start immediate development on a large scale. The properties are located in the Mayo district in the upper Stewart river valley. Aitken, it is said, took out 1700 tons valued at about \$150 per ton, during the winter season. Manley says that they expect to build a road from the landing to the mine so that shipments can continue summer and winter. The plan is to put on heavy motor trucks or tractors, and draw the ore to the Stewart river at Mayo landing as fast as mined. He hopes to have 15 to 20 tons shipped daily this season if the road can be put in suitable condition, and to deepen the shaft and open other shafts. Water is to be pumped from the present shaft, and the depth extended. New stopes will be started and Mr. Ives will remain on the ground as active mine superintendent.

Fairbanks.

The Crow Creek Mining Co. has made a recent cleanup of \$5000 and sent the same to the Union Savings & Trust Co., Seattle.

Joe Henderson, Foss & Farvin, have been working the Homestake quartz mine at the head of Fairbanks creek. They have made a recent cleanup, the result of the milling of 20 tons of ore from the rich but narrow ledge of the mine. Henderson reports that the ore averaged \$100. Foss & Farvin have been working the mine for several years and with Henderson will continue work, hoping that the ledge will widen.

Nome.

The American Dredge Building & Construction Co. has received good returns from its holdings in this district. It now has two dredges working on the Anacovik river, 150 miles north of here. The tin dredge installed by the company in the York tin district in the Arctic country has achieved success during the past season, recovering 60 tons of tin in a 30 days' run.

Seward.

B. Bernard, general manager of the American Dredge Building & Construction Co., Seattle, has a large drilling crew operating on Lewis river, where the strike was made last year. His company controls 5 miles of the stream. In addition to placing the dredges on Lewis river Bernard will remove the Herron dredge from Sunrise to the Nacochna river for the Nacochna Dredging Co. A new hull has been built for the dredge in Seattle and will be shipped immediately after investigating the transportation facilities up Susitna

river by which route water transportation to the property is possible.

George Eberhardt, who has been operating in the Falls creek district since 1905, has returned from Seattle to resume operations on his placer ground on Cache creek. He has a hydraulic plant and will employ about 12 men during the season, work having recently been started.

Susitna.

The Willow Creek district has been producing since 1908. In 1915 three quartz mines operated and produced \$315,000 in values, with an average of 200 men employed at the Mabel Mining & Milling Co. William Bartholf is general manager. A contract was let last fall to Charles Bartholf and Ira Isaacs for 100 ft. of tunnel. They ran 82 ft. without finding any good indications and were compelled to stop on account of lack of mining timber. Late this spring Bartholf and Irwin resumed work and at about 100 ft. in and at a depth of 40 ft. they struck pay. This pay, which is 2 ft. wide, has caused considerable excitement, being of high grade. Their new 20-ton Denver high speed mill is being installed and active work has commenced. The ore carries considerable free gold.

J. R. Austin will spend his second season in the district this year. He is developing a quartz vein on Reed creek. Properties surrounding his have been proven and he therefore expects good results. His property is within 1500 ft. of the McCoy-Martin group and in the immediate neighborhood of the Mabel and the Billy Martin mines. Austin has 12 claims, and has stripped the ledge for 1500 ft. He will drive a tunnel this summer, tapping the ledge at the 800 level. Assays sent out last fall show values from 40 cts. to \$400.

ARIZONA.

Prescott.

The work of installing electric power, wires and appliances at the mine and mill of the Big Pine Mining Co. is practically completed. A large working force is engaged on the property and a considerable tonnage of gold-silver ore is being mined. It is the purpose of the management to reduce all ores in the company's mill. The contract with the electrical company calls for 150 hp. daily. Duluth, Minnesota, capital is back of the enterprise.

Jerome.

Having selected a site for a main working shaft and the development of its property, the Green Monster Mining Co. will this month begin mining operations on its holdings in the lower Verde contact in accord with the recommendations of A. P. Thompson, who recently completed an examination of the property. He recommends the development of the Green Monster vein, including the adjacent deposit on the Cliff claim; development of the outcrop of quartz and hematite at the southern end of the Revenue claim; development of the iron-stained quartz blowout on the Protector claim, and, through the medium of crosscuts and drifts, the development at depth of the veins apexing on the Lone Pine claim to the south. He likewise suggests an investigation of the possible downward extension of the copper-stained diorite on the Amazon claim. The company is capitalized for 1,500,000 shares of a par value of 50 cts. each. Five hundred thousand shares were issued to the Green Monster Syndicate in consideration of \$33,000 in cash, title to 31 claims and the taking over of an option to purchase 32 additional. The directorate then sold 700,000 treasury shares at 75 cts., which netted the company \$525,000. This sum, plus the \$33,000

paid in by the syndicate, gives the company a treasury fund of \$558,000. The treasury fund is intact, save for the amount drawn bi-monthly to pay mining expenses, and is drawing interest at the rate of \$1600 per month. In addition, the company has in treasury 300,000 shares. No effort will be made to sell this stock until such time as the property has been developed to a stage where it is necessary to erect a reduction plant.

Vidal.

On the California side of the Colorado river the section around Vidal is the scene of constantly growing activity. The Bendigo Mines Co. of Los Angeles, which has shipped 450 tons of gold-copper-silver ore netting \$15 per ton during the last few months, is preparing another shipment, and several individual operators operating properties nearby are also preparing shipments of ore which as a rule go to the Hayden smelter. One notable find of silver-lead ore of high grade has been made in the district during the week, while on another property an 8-ft. vein of copper-silver-gold ore has been opened which yielded shipping ore at surface in several places.

On the Parker side of the Colorado river mining activity is constantly increasing, and such a large aggregate tonnage of ore is being shipped that several interests are figuring on building a custom smelter on the Colorado river, near Parker, where it may be reached by mine operators on both sides of the river. Mining men who have studied this district state that the formation and mineralization is similar to that of the Copper Queen, Old Dominion and Arizona Copper mines. The ore is found in fissure veins of great lateral extent, the veins capped by an iron gossan, followed by the leached zone containing copper carbonates and oxides and some sulphides, and all containing gold and silver. The gangue matter is principally quartz, but much calcite and baryte is found with lenses of manganese and iron oxides.

Mayer.

Operations have been resumed at the Holmes mine in Black canon. The property was recently taken over by Willard Bonderant and associates of Los Angeles, who purpose to develop it at depth. The history of the Holmes mine dates back to the early sixties, and its record as a producer of high-grade, gold-bearing ore runs concurrently therewith. Early development was prosecuted by means of a tunnel and disclosed free milling ore. The general average grade of the ore at that time mined is said to have been \$60. It was reduced in a small mill erected on the property at a fair profit. A wagon road has been built connecting the property with the camp of Mayer, and the old workings are now being rehabilitated as a preliminary to extensive mining research.

Walker.

An oil-flotation plant of 100 tons capacity is to be built at the property of the Major Mining Co., near Walker. The decision to erect this plant is the outcome of the returns received on 5 carloads of concentrates shipped to the Humboldt smelter.

CALIFORNIA.

Mokelumne Hill.

The Sullivan and Paul Con. gravel mines have been taken under bond by J. J. Foltz and operations will begin within 40 days. Both mines formerly produced heavily but have been idle several years. It is planned to work the holdings from a central level. Considerable rich gravel is stated to be still in sight in the old workings.

The McKnight Mining Co. has installed a 20-stamp mill and complete mine plant at the Hamby mine. The hoist is operated by steam, generated with fuel oil, but will be later driven by motors. A large tonnage of good-grade quartz has been blocked out. Luther Everitt is superintendent.

The Mokelumne Mines Co. has arranged to sink a 3-compartment shaft at the Easy Bird property and intends to soon install a 75-ton reduction plant, including amalgamating, concentrating and classifying equipment. A cyanide unit may be added later. A 650-cu. ft. Sullivan compressor has been

placed in position, and much new work is advancing from the main tunnel. Above this level a large tonnage of ore averaging around \$8.50 has been developed. An electric hoist is contemplated. H. J. Wendler is manager and A. M. Howat superintendent.

Jamestown.

Bonanza ore has been encountered below the 800 level of the Jumper mine in the Stephen Rowe lease. The rich shoot is believed to be the extension of the ledge which yielded much specimen ore above the 700. Three sets of lessees are working the property with good results.

Sutter Creek.

Unwatering of the Old Eureka mine has progressed to a depth of 170 ft. and three shifts have been put at work in the shaft. Timbers are found in excellent state of preservation, although under water 30 years. At present rate of progress the management expects to be in a position to start important developments before the summer ends.

At the Central Eureka 20 of the 40 stamps are dropping on quartz from the 2800, 3000, and 3100 levels. Preliminary work has started on a winze from the 3200 level, and drifting from the 700 is planned in expectation of intersecting a new ledge. Seventy men are employed.

Jackson.

Preparations are being completed for the sinking of the Kennedy shaft to a depth of 3900 ft. The ore opened on the deeper levels is the best in the mine, with the big vein showing excellent strength. The 100-stamp mill is turning out approximately \$90,000 in gold per month.

Lewiston.

The Trinity Star Dredging Co. is building a dredge on the Paulsen ranch, costing approximately \$300,000. It will be equipped with buckets of 5-cu. ft. capacity and will go into commission early in 1917. The property embraces 700 acres of proven placer ground. Fred Paulsen is manager.

Pine Grove.

The Pitts quartz mine has been taken under bond by M. Robinson, who has purchased the old Climax 10-stamp mill and is moving it to the Pitts. A fair tonnage of excellent mill ore has been opened, some of the quartz containing specimen values.

Washington.

The Columbia Con. Mines Co. has acquired 160 acres of patented ground at Ormonde, above Washington, and is preparing to work the area. The Columbia mine is yielding ore of profitable grade and the mill is running steadily. The company also holds bonds and options on the German and Ocean Star mines, both of which are showing well. E. C. Klinker is manager.

Keeler.

A new lead-zinc ore body has been encountered in the Buena Vista tunnel of the Cerro Gordo, at an approximate depth of 115 ft. It is 30 ft. wide, of good grade throughout, with streaks of high-grade showing. The management is contemplating the building of a reduction plant to cost about \$250,000. It is designed to separate the zinc and lead ores before shipments to smelters. L. D. Gordon is general manager.

Forest.

Under the management of W. F. Copeland three shifts are driving a short tunnel to intersect the old Bald Mountain adit back of the caved section. The new tunnel will be 300 ft. long and as soon as completed will be used to prospect a promising quartz vein in the Bald Mountain mine. It is likely attention may be devoted to the gravel channel later.

The North Fork Mining Co. has purchased from the Wisconsin Co. a piece of disputed ground for \$5200, and will proceed to extensively prospect its quartz deposits through a new incline. The Wisconsin Co. is driving a new tunnel to open its gravel channel to best advantage. G. F. Stone is superintendent of the North Fork, and D. E. Hayden of the Wisconsin.

Clipper Mills.

Prospecting of manganese deposits is active at this point. A. A. Davis and T. F. Hornung are sinking on a promising ledge and running crosscuts. Indications are favorable for development of a large body of commercial ore. Binet

brothers of Oroville are working claims adjoining the Woolley group, the vein apparently being an extension of the high-grade ore body exposed in the Woolley holdings. Operations at the latter have been temporarily suspended as a result of friction between the owner, G. Woolley, and the Noble Electric Steel Co., which has been working the property under bond. The ore is high grade and is desired for the electric smelter at Heroult.

New Idria.

The New Idria Co. has installed a 250-ton concentrating plant at its mines and is also operating the old 300-ton furnaces. Most of the ore is being drawn from the San Carlos mine, where the deposits are broader than in the Idria, and an 8000-ft. aerial tramway is being built from the property to the new plant.

Grass Valley.

After an idleness of 2 years the Sultana mine is again being worked. Fifteen men were put at work last week, and prospecting of the lower workings is going on. The Sultana adjoins the Empire group and formerly produced much profitable quartz, but the principal vein was lost in the deep levels. It is thought extensions of the Empire ledge traverse the mine. A. W. Crase is superintendent.

Hawkins Bar.

The placer mine of the Corona Mining Co. is producing gold and platinum and sufficient water is available for another month of activity. Three bars worth \$1000 each have been shipped since the season commenced, and the final cleanup will take place in July. About 1 oz. of platinum is recovered for each 50 ozs. gold.

Downieville.

Representing Arizona capitalists, Thomas Wilson has taken a bond on the Shady Flat gravel mine, owned by John Mason. The property lies between Downieville and Sierra City and produced well in pioneer days. Orders have been placed for a pumping and hoisting plant and exploration of the old channel will be pushed.

Bishop.

Lessees are opening rich ore on the Santa Rosa mine, controlled by the West End Co., of Tonopah, Nev. The vein averages 4 ft. wide and was encountered at a depth of a few feet. Assays range from \$35 to \$70 in gold per ton. The owning interests are arranging for work on company account.

Sonora.

Rich ore has been opened in the deep levels of the Dutch mine, operated by the Dutch-Swenney Co., controlled by New York people. Splendid ore is also showing in the App workings with a tonnage of large proportions exposed. The mill is treating 250 to 260 tons per day and making a high recovery. Much new machinery has been installed in the past few weeks and since Nov. 1, 1915, upward of 3000 ft. of development work has been accomplished. It is probable the purchase of the group will be consummated in August, as the operators are reported well satisfied with conditions.

COLORADO.

Boulder.

The Tungsten Metals Corporation has completed its mine boarding and hunk house, offices, compressor house, machine shop and store house in Boulder canyon. Its Red Sign mill, being built by the Colorado Iron Co., will be completed by Aug. 1. The capacity of the mill will be 25 tons. The building is placed on a concrete foundation a foot thick, all the footings are of concrete and the timbers used are of large size. Some of the timbers are 12 by 12 and 20 ft. long. The elevator pit, which is now complete, is concrete. All flooring on the ground floor is to be cement. The roof and sides are covered with lightning-proof Galvanite roofing, which is a heavy, gummy paper covered with flake mica.

East of Nederland the McKenzie mill, formerly treating gold ore, has been reopened as a tungsten concentrating plant. New machinery has been installed, consisting of a table and 5 new stamps. These with other machinery in the mill gives it a capacity of 10 tons. Besides custom ores the

mill will be supplied with ore from the McKenzie mines, and a considerable amount of material from old stopes will be run.

The Primos Mining Co. announces that leases upon its tungsten property were renewed at expiration, July 1, upon the same terms as in the past at the schedule of from \$12 to \$20 now in force. This is indicative of the confidence of the company that the lowest prices have been reached and a steady market is in view. There are 500 men employed in Primos ground by lease operators aside from the force on company account in the Conger and other mines. During the past 2 months Primos lessees have sold their ore without delay at contract rates.

Cripple Creek.

The shaft at the C. O. D. mine is being sunk further, work having commenced on July 5. While this work is in progress lease operations, excepting by such lessees as are mining and shipping ore, will be temporarily suspended as the hoist will be running to capacity hoisting such ore and the waste from the shaft. Supt. Williams will give personal supervision to the work of sinking and will maintain his office at the mine.

A vein has been opened on Newton hill by the Cripple Creek General Mining & Exploration Co. It is 4 ft. wide and averaging \$4 for its full width. The vein is cut at a depth of 300 ft. by the New York tunnel penetrating Newton hill from its west slope. It is proposed to survey the course of the new vein and crosscut for it from the tunnel level. The tunnel has caved badly in places through disuse, and it will be necessary to retimber the caved ground. A basalt vein carrying low values is exposed in the New York tunnel and will be explored later. The basalt dike lies on the Katie Hollis. Frank Vetter is in charge, with power to issue prospecting permits with lease option, on advantageous terms. Maps of the property may be seen and examined on request.

One car of mixed ore, a cleanup of the bins and mine, preparatory to hoisting ore from the more recent discovery, brought settlement at the rate of \$19 a ton for lessees on the Shoo Fly. The second car, containing coarse ore from the new strike, was settled for at a rate of 2.70 ozs. gold. They have been breaking ore at the junction of two distinct veins—a vein having come in from the southeast—6½ ft. wide. The shoot under development lies at a point 40 ft. north of the shaft, and as the incline drift is carried northwards, the values are improving and the present prospects for one of the richest ore shoots opened in the western section of the district are considered excellent. Ore is being hoisted after every round of shots and lessees will ship again in a few days.

During June there were 76 cars, about 2000 tons, shipped from the El Paso Con. Co.'s property. Returns have not all been received, but an estimate of better than 1 oz. of gold per ton is given. The company mined 19 cars, 500 tons, from No. 1 shaft, on the south end of the property, and 10 cars, about 265 tons, from the No. 2 shaft, on the north end of the property. The company ore, it is estimated, will average \$15 to \$20. The lessees working under a graded scale of royalties or under the split-check system, were accredited with 47 cars, about 1245 tons. The lessees' ore at the 1st level, south of the No. 1 shaft, was of a higher average value than the company ore and is estimated at \$30. There are at this time 17 sets active. Twelve sets of lessees are working under the graded royalty, and five on the split-check.

GEORGIA.

Dahlonega.

The Etowah Milling & Power Co. has been formed and begun preliminary work on the Etowah river, about 5 miles from here. Associated in the company are: D. S. Walraven, C. H. Butts, W. L. Tumlin, T. H. McGahee, J. T. Ritigan, H. E. Cabiness, H. H. Turner, S. A. Osborn, J. H. Simms and Dr. Hulaney. The method to be used is suction dredge on a large scale. It is well known that there are deposits of gold in the Etowah bed. Work of installation has begun

and mining work will start as soon as equipment can be completed.

G. W. Tonson, operating the Standard mine and Toledo mill, is continuing development. At the mill work as yet is of an experimental nature. There are three shafts, none of which have reached any considerable depth. All show large veins of gold-bearing quartz rich in sulphides. The amalgamating plates save only \$4 to \$7 of an assay value of \$25 to \$40 per ton, but the concentrates are being saved for either cyanide or flotation treatment. The black sands, rich in magnetic iron, show an assay value of \$40 to \$50 per ton. Additional stamps will be installed in the Toledo mill, and the Mary Henry mill will be started in the near future. All the mines are being worked for hard ore and compressed air is being used for drilling and hoists.

IDAHO.

Burke.

Development of the Got-Em-Now vein of the Marsh Mining Co., soon to be reorganized as the Consolidated Marsh Mines, is to begin from the long lower tunnel of the Gertie mine, adjoining, according to M. W. Lee of Duluth, Minn., recently elected president of the Marsh Co. "The principal purpose of my visit at this time was to dissolve the attachment on the Marsh property, and this has been accomplished," said Lee. "All interest in the Marsh heretofore held by C. L. Cowell and his Montana associates has been acquired by persons associated with the present management, and we shall now proceed with the execution of our plans to restore the property to its place among the producers of the Coeur d'Alenes."

Wallace.

F. C. Bailey of Spokane, who recently organized a syndicate to take over control of the Vienna-International Mining Co., states that a crew of men already has been put to work repairing the old workings preparatory to beginning active development. Arrangements are now being made for a hoist and compressor. A boiler has been secured and the compressor will soon be on the ground. The company owns a good water right which it expects to utilize later for power purposes. Bailey stated that he expected to buy a hoist from the Hypotheek Co., but this was not certain. He expects to have all machinery in operation by the middle of July. The development of this property will be watched with unusual interest, as it is in a new section so far as mineral production is concerned. The showing of lead ore on the property is one of exceptional merit, and all indications point to the development of a body shipping ore.

The Chicago-Boston Mining Co. is preparing to construct a mill of from 200 to 250 tons daily capacity, and work probably will begin in the next few weeks. The company now has the Western Union Mining Co.'s mill under lease, and for several weeks has been making tests with a view to determining a treatment system for the proposed new plant. These experiments lead to the belief that a straight flotation system, with modern crushing machinery, will do the work successfully, and plans along this line now are being formulated. The company now is employing 12 men in development. The property is equipped with a compressor, electric lighting system, power for actuating the machinery being provided by a Pelton wheel. There is an adequate supply of water for power, and several capable engineers who have examined the holdings recently assert that with suitable treatment facilities the mine soon will be on a producing basis.

Definite plans have been made for the 100-ton mill for the Constitution mine, in the Pine creek district, and it is expected that it will be completed and operating in the next 90 days, according to Judge George Turner, president of the Constitution Mining Co., who says: "Much of the machinery already has been ordered, and a 100-hp. motor to drive the equipment already has been bought. We also have purchased a saw mill and a 30-hp. motor, to be delivered immediately at Pine Creek station, and as soon as these are installed we will begin getting out the timbers for the buildings. The mill will be of similar type to that of the

Ray-Jefferson Co., the flow sheet being nearly identical. Development of the mine is progressing satisfactorily. The main tunnel is in 875 ft. and has shown a continuous ore body containing three shoots or lenses of good average width. These shoots were, respectively, 75, 125 and 350 ft. long, the last ore body still showing strongly in the face. On the 200 level of the shaft, sunk a little to the north of the portal of the main tunnel, the drift to the south under the tunnel is now 200 ft. long. It started in the new ore shoot developed by the shaft, which rakes to the south, and is now nearing the first ore shoot developed by the tunnel, which it will open at an added depth of 200 ft."

Porthill.

Shipments will be resumed from the Idaho-Continental Co.'s mine, 26 miles from here, soon, and it is anticipated that by Aug. 1 a car of concentrates will be forwarded daily to the smelter, according to A. Klockmann, president and general manager. The company's mill and compressor plant were totally destroyed by fire about a year ago, just after they had begun to operate, and this has seriously interfered with production. "About 50 men are employed getting the wagon road from Porthill to the mine in shape for traffic, and taking in the machinery that has been at the railway since last fall," said Klockmann. "There are between 30 and 40 tons of this equipment, but we soon will have it delivered and installed. We have been doing but little development in the mine, centering our efforts chiefly in getting the concentrator ready for service, but we have several months' ore ready that will reduce about four into one, producing a concentrate that will average 60% lead and 30 ozs. silver."

Wardner.

The Independent property, taken over this week by Pat Gearon and associates for \$300,000, will be developed as fast as machinery can do the work, according to reports from Kellogg.

Machinery sufficient to handle 600 ft. of shaft has been ordered and will be installed at once. Electric power will be carried to the property by the Washington Water Power Co. as soon as the line can be surveyed and the poles installed. Men are now at work preparing to erect buildings on the ground and put up shaft house and compressor foundations.

"Sufficient capital is in the bank to operate a large crew continuously," stated George McKinnis, who closed the deal. "We expect to rush the work and open the property as fast as miners and machinery can do it. Engineers, who have examined the property for us, report the showing to be one of the best in the district for the development of a big mine, the ledge on the surface showing over 20 ft. in width. We have been working on the deal for 4 months and now have everything lined up for immediate operations."

Kellogg.

Plans for operations being perfected by the lessees of the upper workings of the Big Creek Mining Co. indicate that the ore showings must be of unusual merit, although no definite reports on the physical condition of the property are obtainable. Rumors are circulating that some rich ore has been encountered, together with extensive deposits of a similar grade to that shipped in the last year, which yielded from 70 to 110 ozs. silver. The leasing company now is installing an electrically-driven compressor plant, and soon will begin construction of an aerial tram from the mine to the railway shipping bins.

Net returns of \$3001 from the 36-ton carload of ore recently shipped by the Big Creek Leasing Co. have been received by Dan Price, president of the company. This car sampled 285 ozs. silver and 9% lead, and was marketed when silver was worth 67 cts. The shipment was entirely of crude ore. Another car has been loaded and will be shipped soon.

LAKE SUPERIOR.

COPPER.

Houghton.

Worden-Allen Steel Co. has begun the construction of the new steel shaft-rockhouse at No. 2, Ahmeek. The foun-

dations were laid last year ready for the steel. The seventh stamp went into commission the 10th. The mine will soon be crowding this stamp, as it has the others, and the daily tonnage will then reach 4900.

Mohawk, Wolverine and the Quincy have granted the bonus of 25 cts. a day to all employes for the last half of the year, as had been announced by the Calumet & Hecla. Copper Range has given out a wage scale of \$3.50 for miners on company account and \$3 for trammers and other underground labor.

Ontonagon county is more and more becoming a center of interest to the mining men through the success of the White Pine, White Pine Extension, and the explorations at Carp Lake, the finding of good cores at the Tremont-Devon, the diamond drill explorations recently begun at the old Norwich, and the equipping of the Victoria with a new hoist and the providing of a new-skip-way, so that its output can be made profitable even at low prices of the metal, and the disclosure of rich rock in the reopening at the Michigan. Consequently the possibilities of land that has been held for years are being looked into.

Isle Royale's development work for the past month is over 1600 ft. This is rather remarkable as the tonnage is over 2900 daily. The ground is so "bunchy" that much more ground has to be opened in order to maintain the reserves to the proper amount than at most of the mines of the Copper Country. Of the daily shipments 2200 tons go to its own mill, where the efficiency has been greatly raised through the addition of new machinery. No. 7 shaft is down about 300 ft., and it has been raised 140 ft. from the 5th level, which is about as high a raise as can be profitably carried, leaving only about 150 ft. to be cut through.

South Lake is still forwarding about the same amount of rock to the Franklin mill—100 tons—and each lode is furnishing about the same quantity. They are all maintaining about the same average of rock they had when first opened by the crosscuts. A little development work is being done on the 5th level.

Mohawk is carrying on a large amount of new work and has been sinking at four of its shafts. No. 6 is down to the 15th level; No. 5 to the 18th; No. 4 to the 23d; and No. 1 to the 23d. Sinking is just being resumed at No. 1. At No. 6 the work is almost wholly exploratory.

Houghton is still getting a fair grade at the northern drift at the bottom, the 12th level, and is in 160 ft. from the shaft at the 4th level, having passed through the lode 50 ft. west of the shaft. The crosscut that is seeking the West vein of the Superior mine is in 140 ft. from the Superior lode. This work will be carried to a distance of over 200 ft. if necessary.

Champion at the high grade stretch south of its No. 4 shaft where the first levels were being extended to its limit of 3500 ft. is now running drifts on levels below these and finding the same good grades. It is also extending new levels under those already opened in territory north of No. 1 shaft, which was for a long time left untouched after about 200 ft. had been opened with poor results, and which when reopened about a year ago and ever since, has been giving high values. The whole extent of the lower levels of all four shafts is averaging high at the present time.

Calumet & Hecla is holding its daily tonnage up to 10,500. The leaching plant will be started this week and will probably have to pass through the usual period of adjustment before it can be put into regular operation.

Algonac, as the four sections between the Nonesuch and the White Pine Extension are termed, has about completed its diamond drill explorations. It has proved up $1\frac{1}{2}$ miles of rich ground—enough for a good sized mine. The eastern end towards the Nonesuch has not so far shown good values and will not be explored further at present.

Cass, which is the Norwich or Copper Crown property, is putting a second drill to work. The first has reached a depth of about 460 ft. The work is being done on virgin ground, which is believed by our geologists to be quite promising.

Keweenaw should be ready for the mill test about the middle of August; it has been delayed greatly by the non-

arrival of all the timber for the trestle. Sinking has been discontinued for a while. A rich quantity of mass copper has been recently come upon.

Franklin has been having its smelting done at the Quincy until June 1, but the quantity was becoming so large that it could no longer be handled and the Michigan smelter, which has a very large capacity, is now taking care of it.

Carp Lake, it is reported by Supt. Rourke, in the examination that is being made along the outcrop, is finding the same values as in the shaft that was recently unwatered. Another shaft, No. 9, according to an old map, is now almost wholly unwatered, and there also are being encountered the same high grades. At this point, which is half a mile from the first mentioned shaft, it is the intention to crosscut the vein about 200 ft. from the surface. It is quite noteworthy that in every case where copper has been discovered, silver has also been met with.

Victoria will not have its shaftway and new hoist ready for operation until about Aug. 1. By the last of next week the installation of the machinery will be begun and will probably take about 2 months. The new skipway will be in in another week down to the 25th level, one level from the bottom, and the tracks are laid to the 16th level. The tonnage of good rock was lessened last month by the necessity of getting out as much as possible of the waste rock that was coming from the raises on a number of levels, and there was produced at the mill only 83 tons of mineral, which will average over 12 lbs.; but this month the waste rock has been less and the mineral will run up to 100 tons. When these two improvements are made this mine for the first time in its history will have an opportunity of taking out an amount of rock that will pay even with low prices. It has a large amount of reserves on hand now and consequently it will not have to push its development to its utmost, although as much will be done as is consistent with getting out a good tonnage, as it is believed that its ground, as in the past, will improve with depth, and sinking will be resumed as early as possible.

Adventure has received its timber, which came from the Pacific coast, and has begun on repairing the lining of the collar of the shaft and will begin to unwater at once. A sufficient number of men have been taken on and the work of exploring the Knowlton and Butler lodes will be begun immediately after the uppermost levels have been drained of their water. It is thought by our mining men that with the prevailing price of the metal the mine will begin to pay as soon as enough ground can be opened to afford the proper tonnage.

Lake will probably, after the expected visit of President W. A. Paine, open up the old shaft on the Knowlton lode, which has a depth of 900 ft. and explore that lode and the other adjacent lodes, including the Butler.

Mass is holding to about the same figures for its daily tonnage, a little over 1200, and to about the same yield, almost 16 lbs. For a remote and rather out-of-the-way mine the management has been very successful in getting men, and it would appear that there is not so much difficulty generally here in getting them as for the past 6 months.

IRON.

Ironwood.

A new shaft has been commenced at the Aurora, which under the present conditions will be completed by January, 1917. The Pabst shaft, which it was intended to start in June, has been delayed by lack of equipment, which was not delivered. It will, however, be started during the latter part of July. These two new shafts will supplant the three shafts formerly found necessary.

possible with steam shovels is attained, the usual course of employing the milling system to about 400 ft. depth and then an actual underground system, is the company's intention.

The labor trouble here is being carried on in a more quiet way at present and it is said an end to the trouble is near. Some of the men are returning to work and good productions are being made from stock piles and open pits whose operations are not affected by the trouble. Not being successful in

the superlative degree with arousing the miners to stop work on the iron ranges an unsuccessful attempt was made to call a strike of the dockmen at Duluth.

Duluth.

The strike apparently has had little to do with production, for during June the Lake Superior district shipped 9,507,578 gross tons, which in the face of unsettled conditions was the banner month in the history of the district as an iron ore producer. This figure was 58.32% higher than June, 1915, and exceeded the shipments for May, 1916, by 1,057,996 gross tons.

Virginia, Minn.

The first ore from the Mahnomen mine was shipped to Duluth 2 weeks ago and July 8 the second steam shovel was started in the large open pit. Manganiferous and plain ores are produced and it is rumored that 1917 will see the property a shipper of 1,000,000 tons annually. After the greatest depth

MISSOURI-KANSAS.

Joplin, Mo.

The lowering prices of ore has had the effect of casting considerable depression over some portions of the mining district, especially in those camps where the percentage of recovery is 2½% and less. Mines having this percentage are facing difficult conditions of the high prices of supplies which are being maintained and raised from week to week, while for 2 months now the prices for ore have been steadily going down. The only places the operators have been able to recoup themselves has been in the lowering of the wage schedule, and this has met opposition from the miners, but even with the wage scale reduced, the margin of profit on this class of mining is small (\$60) at the present time, and already a number of producers have been forced to close down. That others will follow is a foregone conclusion. These mines that close down operate automatically in reducing the production and will help materially in preventing the further increase in the stocks of ore that have been accumulating in the last 2 months, and which is the largest local factor which helps to hold down the ore market. However, many of these producers will be replaced by newly developed properties in the Miami (Oklahoma) field, where the cost of production will not be as high as in the low-grade deposits of some of the central camps. They will be able to operate profitably at even a lower price level than is now prevailing. The Miami field has just been reaching the point in its development period when a very large new production will begin to be added.

Prospecting at the old Thoms Station camp by Bilger & Co. on the Mexico & Joplin land tract has opened up a deposit of ore which warrants the building of a 150-ton concentrating plant. Contract for the plant has been let, and the material is now on the ground and is ready for construction. On the adjoining lease at a depth of 103 ft. a very rich run of lead has been struck by the Sweetheart Mining Co. Along with the lead is now appearing some zinc blende and the operators expect to have a good production of both from now on.

Following the resignation of I. L. Burch from the state mine inspectorship of Joplin, Joseph Myers was appointed by Gov. L. W. Majors to fill the unexpired term. Burch has been employed by the Lincoln Mining & Smelting Co. as field manager, and will look after the prospecting and development of its recently acquired leases in the Webb City district.

T. B. Baker and W. R. Baker have started operating a new concentrating plant under the name of the National Mining Co. on a lease of the Empire Zinc Co.'s land southwest of Joplin. The company has developed an 18-acre lease and is turning out a good production of both lead and zinc. The dirt now being mined is running 5 to 8% and the concentrates are high grade.

At the Airedale mill west of Joplin, the Kenefick Zinc Corporation is making a number of improvements in its plant. The sludge department is being increased by the addition of tables. A larger crushing department is being added,

an increased power plant and increased facilities for handling tailings.

On the Dixon land north of Joplin, the Babcock Mining Co. has opened a very rich deposit of lead at 182 ft. The ore occurs in soft ground, and at one point a solid chunk of galena ore weighing 8000 lbs. rolled out of the face and demolished a set of timbers. This company is sinking two of its shafts deeper in an effort to open up what has been found to be an extension of the ore deposit in a lower level. The company is handling its ore over a 150-ton mill. J. K. Davidson is superintendent with offices in Joplin.

The Napoleon mine on the Perry land at Thoms Station has just been drained after being under water nearly a year and a half. The production has been resumed and its usual output of 1 to 2 cars a week may be expected. It was due to cave-ins of the ground to the surface directly in the path of a water course that the mine was drowned out, and not until the surface water course was changed were the operators able to re-open the mine. Edward Cunningham of Joplin is the manager.

A new prospect known as the Mary Jones mines has just been developed on the Phillips land at Thoms Station. The operators claim the mine is turning out ore that will mill 30% zinc. Another new shaft is being put down and the ore is being cleaned on hand jigs until a concentrating plant can be erected. The mine is near the Bonnie Bell property, which has been one of the best producers developed in that field.

Miami, Okla.

In the Miami field the building of the new railroad connections between Miami, Commerce, Cardin, Picher, Baxter and Century is rapidly being completed. The line has already been completed as far as Picher and service is being maintained. A belt line is being built from Picher back to Century and Commerce, while the line is being extended directly to Baxter Springs, where the line will join the M. O. & G. railroad for connection with Joplin. This will give the camps in the new mining field both passenger and freight service. It will no longer be necessary to haul heavy machinery from Miami or from Baxter Springs into the new camps over bad roads, as the cars can be placed directly on switches at any of the new mines in the field. Had this been possible last winter the camp would have had 15 new mills in operation by the first of April, instead of being held up till the first of August.

The Commerce Mining & Royalty Co. will build a new concentrating plant on a 160-acre lease of the Goodwin and Cooper land just north of Picher where the state line joins Kansas. Drilling has developed a very rich deposit of ore, and the company plans an early production from the lease.

C. H. Strecker and associates are developing a sublease of the Picher land a mile north of Cardin. Drilling shows the existence of two runs of ore, the first at 115 ft. showing an 18-ft. face, and another at 200 ft. showing a 16-ft. face. The drilling will be continued until the lease is thoroughly developed.

The Eagle-Picher Lead Co. is putting down two new shafts on the James Goodwin and the Roy Harvey lands just north of the Picher camp. The company plans to erect a new concentrating plant at this point as soon as the shafts reach the 240 level. This makes 19 shafts the company has in operation, or are putting down in that field.

The Commerce Mining & Royalty Co. has just completed the installation of Dorr thickeners and Deister tables and enlarged settling tanks for the handling of the sand and slimes made at its two mills on the Blue Goose and Beaver mines near Cardin. These two properties are known as the richest properties in the Oklahoma camp; the amount of slimes made at the two mines is very large, and while it already had 10 tables at each mill, the equipment was inadequate for handling the ore.

L. P. Buchanan and J. W. Hoffman of Kansas City have completed the drilling of 18 drill holes on the George Toskoff land southwest of Baxter. In 10 of these holes on one 40 acres there has been reported some very good strikes. The ore was discovered at a depth of from 252 to 277 ft. Two shafts will be sunk immediately and preparations made for the erection of a concentrating plant.

MONTANA.

Butte.

Regular shipments of ore from the Nettie, which was recently unwatered by the Anaconda Co., are being made. It is estimated that there has been blocked out probably 40,000 tons of silver-zinc ore. The Nettie was a big mine in early days as a producer of silver, being one of the chief contributors to the old Colorado smelter, long since dismantled. The ores became base as the water came in and the mine finally was shut down. Now metallurgical conditions have changed and in addition to the materially lower smelting charges, the presence of zinc, especially if the content be heavy, carry a value, especially for the Anaconda, which has under construction a 2000-ton zinc flotation concentrator at the Washoe works in Anaconda and an electrolytic zinc reduction plant at Great Falls. Both these plants it is expected to have under way in the early fall. Preparatory to increasing its shipments from the Nettie, the Anaconda has two ore bins under construction at the mine and numerous other plans have been formulated looking to a greater production.

Butte & Superior produced 15,200,000 lbs. of zinc concentrates in June, as compared with the production for the previous period, which was 16,000,000 lbs. The Black Rock mill produced 14,400 tons of concentrates from the treatment of 52,600 tons of ore. The mill recovery for June averaged approximately 94%, as compared with 93 for May. Fifty-four thousand tons of ore were milled in May, with a concentrate recovery of 15,200 tons. Silver in concentrates for the past month approximated 310,000 ozs. The lead production for June reached 540 tons. Butte & Superior concentrates carry approximately 80 cts. gold. The new shaft of the company has reached a depth of 1400 ft.

The Davis-Daly Co. soon will begin the pouring of concrete for the foundation for its new Norberg hoisting plant. Anchor bolts are en route from the plant at Milwaukee, and upon their arrival the foundation will be rushed to completion. The excavating and the placing of the foundation timbers and works have been finished. It is planned to have the plant in commission by Sept. 1. This, it is believed, will enable the company to increase its output of ore. Timbers now are being framed for the housing of the engine.

Anaconda's June production of 28,100,000 lbs. of copper compares with 30,000,000 in May and 33,300,000 in April and 22,100,000 in June, 1915.

A judgment for \$177,704.40, in favor of the Clark-Montana Realty Co. against the Butte & Superior Co., was rendered last week by Federal Judge George M. Bourquin in a final decree handed down in the Elm Orlu case. In addition to the judgment, interest at the rate of 8% per annum was allowed beginning June 1, 1916. The decree allows the amount named for ore taken by the Butte & Superior from the Elm Orlu lode prior to the time of starting the suit. At the same time the prayer of the defendant for damages for ore alleged to have been taken from its property was denied. The decree of the court holds that the Elm Orlu claim is the property of the Clark-Montana Realty Co. and its co-plaintiff and tenant, the Elm Orlu Mining Co. It holds that the Butte & Superior is the owner of the Black Rock, Jersey Blue, Admiral Dewey and Silver Lode claims. Each party is to pay its own costs.

In a few days the sinking of the shaft of the Emma mine by the Anaconda will be commenced. The Emma is down 800 ft. and it is intended to carry the shaft down an additional 800 ft. before any mining is done. The engine installed is working smoothly and all the new buildings about the property are completed.

Troy.

Improvements at the Banner & Bangle mine, recently acquired by the Snowstorm Mines Co., will be completed by September, unless prevailing high waters in the region interfere with construction, according to Leo Greenough, president and general manager of the corporation. "We are employing 275 men at present, and by July 15 probably will have 400 on the payroll," said Greenough. "Work on all

three constructions, the railroad, concentrator and hydro-electric power station, is going forward rapidly and they probably all will be completed about the same time. The betterments will cost not less than \$500,000, but when we are ready to operate we will have things in such shape that we can keep the property producing at the limit for years. The railway is under construction from one end to the other from the mine to Troy. All the rock work for the power plant is covered. The mill is well under way and the construction of ore bins will be begun in a day or two. We have 25 cars of lumber ready to ship to the work whenever the Great Northern is ready to move it."

NEVADA.

Goldfield.

The Goldfield Con. Co. has completed installation of its 1000-ton flotation plant and has the first unit of 500 tons in commission. Within a few days the plant will be working at capacity. An extraction of 92 to 93% of the gold and 99% of copper values is made. Production from the deep levels has been resumed for the first time in 2 years, and bulk of ore milled will hereafter be drawn from below the 600 levels of the various properties composing the group.

Operation of the flotation unit of the Florence Co. has been delayed by the non-arrival of the ball mill, but the management expects to start the machinery within a few days. Late work on the 650 level has opened a good vein of milling ore, with portions assaying \$40.

The north crosscut from the 770 level of the Velvet shaft of the Jumbo Extension has penetrated a wide vein assaying \$11 to \$14. This occurs in virgin territory 250 ft. from the shaft. In the southeast section of the Velvet claim shipping ore has been opened in the contact zone at a depth of 900 ft.

A new vein has been indicated in the Silver Pick at a point 450 ft. west of the main shaft by the Calyx drill, operating from the 500 level. Parts of the core assays high in gold. Sinking of the main shaft to reach the shale-lattice contact is progressing rapidly and within 30 days the management expects to start important lateral work.

Searchlight.

The Quartette gold mine has been sold to the Dupont Copper Co. of New York for \$120,000. The mine was one of the premier gold yielders of Nevada from 1900 to 1907 and has since yielded rich ore at various periods. Late work in the lower levels uncovered ore of good grade and it is said the new owners will erect a mill to replace the plant burned 7 years ago.

Tuscarora.

The syndicate of eastern capitalists recently acquiring the Tuscarora group of silver-gold mines is sampling the old dumps with a view to their treatment. A large quantity of ore is available, sampling around \$5 in gold and silver, chiefly silver. Sampling equipment has been installed and several miners are engaged.

Kennedy.

The new mill at the Kennedy mine has been placed in commission on ore of good grade. Work was resumed in the mine several weeks ago and a good tonnage is available for extraction. L. St. D. Roylance is manager, and S. L. Berry superintendent.

Gweenah.

The Lemaire mine at this place, owned by Henry Lemaire of Battle Mountain, is yielding high-grade silver ore from the 100-level workings. The shoot has been opened for over 100 ft. and several small shipments have been made. The richer ore carries much native silver, mixed with horn-silver. The discovery has revived interest in this camp, situated 7 miles west of Austin, and prospectors are again showing much activity.

Pioche.

Shipments are going out at the rate of 86 tons per week from Pioche mines, with the Prince Con. contributing 75 tons. The new mill of the Con. Nevada-Utah is running steadily and producing an excellent grade of concen-

trates. A southwest crosscut is being driven from the 1400 level of the No. 1 shaft to prospect promising ground south of the main dike.

Austin.

The Nevada Equity Co. is developing its holdings in this district with a view to opening the rich ore bodies exposed by the Cummings interests. The tunnel will be driven to a point about 1400 ft. from its portal and will prospect a broad area of virgin territory.

Ludwig.

Another shoot of rich ore has been struck in the Ludwig mine of the Nevada-Douglas Co., the discovery being made in the limestone footwall. Developments have kept the reserve well ahead of production. The plant is being gradually placed in shape for capacity operations. The company shipped 18 cars of ore in May, for which it received net returns of \$2320 per car, after paying freight and smelter charges. During June it shipped 22 cars, which, at the same price per car as May, would yield the company \$51,010. The above does not include returns from ore treated in the leaching plant, on which the company has not yet issued any definite data.

Rochester.

The north end of the Rochester Mines workings is offering interesting developments that indicate the approach to the high-grade ore shoot which apexes in Block 4 of the Crown Point No. 1, the most northerly point yet reached. Both the East and West veins in Block 3 are showing some of the best ore ever mined in Rochester hill. The East vein on the 250 point below the apex now shows 2 ft. of ore that returns \$154.70 in silver and \$5.20 in gold. The West vein in practically the same longitudinal portion of the mine is showing 6 ft. running 22 ozs. in silver and \$5.50 in gold. The veins are very close together in this territory and it is an open question which is the one mined at the apex under the regime of the old Hunter lease from which very rich ore was shipped. Preparations are going forward rapidly for the new mill equipment which will bring the treatment rate up to 150 and 200 per day. The work requires the installation of an additional tube mill, a classifier, an agitator and two settling tanks. This innovation can be affected at little expense, but will add greatly to the bullion production the current year.

Seven Troughs.

The recent strike reported on the 1660 in the Seven Troughs Coalition is developing into a good ore body. In the north drift they are now cutting 1 ft. of \$600 ore. Since first encountered in the main winze which penetrated the vein at the 1660 point, the shoot has measured from 1 to 1½ ft., the first values being in the neighborhood of \$300. At this writing the assays have doubled across 12 ins. with every indication that it is the big ore body exposed on the north 1600 and continuing on past the present deepest working. Development is being urged along the 1660 level occasioning a slowing up in the north winze from the 1600, which is down about 50 ft., all in ore ranging from 1½ to 3 ft. and running from \$200 to \$300.

NEW MEXICO.

Mogollon.

The Oaks Co. is shipping ore to custom mill from development work on both the Eberle and Clifton mines. No stopping is being done on either property.

At the Mogollon Mines Co. operations for last half of June resulted in 14 bars of gold and silver bullion, making a total of 28 bars for the month. During the week 875 tons of ore were milled, producing several tons of high-grade concentrates. Good progress is being made in sinking new shaft.

Socorro Mining & Milling Co., in conjunction with local property owners, is cribbing and filling road in cañon through Mogollon to facilitate heavy hauling during rainy season, now at hand. The new tailings elevator system is expected to be in commission at an early date.

Pacific mine, through unavoidable causes, has been delayed in delivery of lumber for ore bins at terminal of aerial

tramway, but hauling is now going on and the work will be rushed to completion. It is expected to ship from 50 to 75 tons of ore daily to the Socorro Co.'s mill as soon as the tram is finished.

Deadwood mine engineers have been making an examination of the property with the view of unwatering the mine and starting operations under bond and lease.

Silver City.

The capitalization of the Carlisle Mining Co. has been increased to \$3,000,000, divided into 600,000 shares. Carlisle has 500,000 tons of ore ready for stoping. At the present prices of metal the gold, silver, copper, lead and zinc contents are worth \$30 a ton. The deepest working is 627 ft. With the above work done it is rumored that the concern is to erect an electric plant at Duncan, Ariz., or nearby point on the Frisco river. The plant will not only furnish power for mining, but may also supply current for a 13-mile electric road from Duncan to Carlisle.

A group of claims a short distance northwest of the Carlisle property will also be opened in a short time by the recently formed Progress Mining Co. The company is composed of James V. Parks, L. A. Hohstadt and Charles Hanson.

OREGON.

Champion.

The Champion Con. Mining Co. has been formed with 3,000,000 shares, par value 10 cts. It will operate property in the Bohemia district. The property was located in the early days when over \$2,000,000 were produced in gold. The old 30-stamp mill will be increased to 50 stamps and it is thought now that flotation will be used on some of the ores. Considerable timber is on the ground and a hydro-electric plant will be erected. Mr. Jeldness is president, J. S. Lewis, vice-president and treasurer; C. V. Bobb, managing director, and H. C. Mahon, Portland, secretary.

Sumpter.

H. M. Parks, A. M. Swartley and G. E. Goodspeed of the Oregon State Bureau of Mines will spend the summer in field work in eastern Oregon. Next fall the bureau will publish a bulletin covering the results of their observations. A shipment of 20 tons of asbestos at \$150 per ton has been made from here. It was produced from mines in Grant county. R. Baird has returned to operate the West Side mine, near Greenhorn. For several seasons the property has given good returns. The Buffalo mine is now being worked under lease by H. Norkus.

William Schluting is now operating the Susan D, or White Swan mine. There is sufficient ore on hand now for a year's run. They are talking of remodeling the milling plant. The power question is unsettled as yet, but the owners are negotiating with the Eagle River Co. for power.

Bourne.

The American Zinc, Lead & Smelting Co. have an option on the E. & E. mine, with the privilege to buy at \$400,000. At present C. O. Lindberg is examining the property for the company. Considerable preliminary work will have to be done to unwater the mine before sampling. The E. & E. is one of the best-known mines of this vicinity. After extensive development and the installation of equipment worth \$200,000 work was stopped in 1887 because it was found the ore could not be treated by the process. In 1890 the property was under lease 2 years and by use of cyanide paid. The operators could not secure an extension of the lease and the mine has lain idle since.

SOUTH DAKOTA.

Lead.

A hubernite tungsten deposit has recently been uncovered in the Two-Bits district at the head of the west fork of the creek, not far from the Monarch mine. The prospecting was being done on patented ground, which was formerly

worked for gold. P. H. Smith owns the property and M. Brosnahan made the find.

Custer City.

R. M. Malone now has a force at the Deadbroke and will soon have the property in shape. It has produced gold in former days and the water will be taken from the 2000-ft. incline and stopes. Several stopes have been opened up in the past and a great deal of ore taken out. Besides these stopes, there is a vast amount of ore blocked out in the property; and as it is of a grade which will pay to ship and mill, it is expected that this will be done so soon as the work which is now in hand has been completed.

The annual report of the Mogul Mining Co. shows that during 1915 the company had milled 31,213 tons of ore and had treated 6206 tons of purchased ores, or a total of 37,419. From this ore had been extracted 7,371,7129 ozs. gold, valued at \$153,387.64. Silver extracted, 16,493.49 ozs., valued at \$8217.44. A larger tonnage than in the previous years was extracted from the company's property and there was a similar increase in the tonnage purchased. The North Lode produced 50% of the ore from company property and was operated on company account, the other workings being mined principally by lessees. The Mark Twain ore was lower in grade; lessees found a few small bodies of good ore in the McDonald; the Oriole, mined close to surface, was disappointingly low in grade; the Passaic work was of prospecting character; the Pluma tailings came from an old chlorination mill dump, of fair grade, but yielding poor extraction. The small apparent progress in mine development, shown as 100 ft. of the Mill raise and 172 ft. in Carstreet tunnel is not a fair measure of the year's preparatory work. This raise is the proposed main working shaft mentioned in previous reports as the outlet for ores from the Ben Hur quartzite level, to start it required much preliminary work. In addition to this work all air compressing plants were assembled as part of the main power plant at the mill and a trunk air line was extended to the North Lode in one direction and to the Hardscrabble in the other. This work was all classified as mine development and the total cost, \$6550, was charged off as mine operating. The necessity of diverting funds to other channels prevented further progress in underground work. There was an operating loss of \$1050.53 after charging \$6242.59 to depreciation. Other figures show that the loss was not indicative of more poor operation, but rather that of meeting many former liabilities.

Deadwood.

A 500-hp. boiler plant has recently been installed and is now operating a compressor plant at the Custer Peak Co.'s property. Work of sinking in the main shaft has been resumed from the 350-ft. level, and will be continued to the 800-ft. level. At present there is plenty of ore available in the property, but as it is practically a native copper proposition, it is the intention of the company to at once erect a mill-plant and install concentrating machinery.

Owners of the Snoma group are contemplating co-operation with neighboring claim workers in building a road to the property for hauling out their ore on. The group is on Squaw Creek and recent assays show a trace of gold; 47 ozs. silver, and 22.12% manganese. Ore carrying less than 40% manganese does not pay to mine exclusively for that metal, but 22% would pay in connection with other values. With silver at 65 cts. per ounce, 47 ounces would make the value \$30.55 per ton.

UTAH.

American Fork.

The Lavaun Mining Co. has been incorporated to operate in this district. The Fissures Development Co. has selected the site for its mill which will be at the mouth of the Dutchman tunnel east of the dump. The mill is intended to work the ore from the Dutchman lease. The tunnel is being retimbered and will be in condition for use in a few weeks. The Dutchman is known to have immense bodies of low-grade ore in its lower workings. The mill will probably have a capacity of 60 tons per day and a part of the machinery from

the old Pacific mill will be used. The engine was brought down and sent to Salt Lake to be repaired for this purpose. The balance of the plant will come from Bingham, where an old mill has been purchased. Work on the construction of the buildings has commenced. A great deal of the Pacific ore will be sent through. For every ton of high-grade in the mine there is about 20 of low-grade. The high-grade copper ore is ribbed every few inches with quartz which may make it desirable to run this class through the mill. All ore going through the mill only pays the original owners of the mine 15%. A contract was let to build a new road 1¼ miles long from the Pacific tunnel to the site of the new mill. This road will be built on an even grade and will probably be ready for use in 3 weeks. The Pacific has shipped 4 cars since spring. Returns from the first 2 cars have been received and show an average of 41% lead, 14 ozs. silver, 1½% zinc, 26% sulphur and 15% iron. It is desirable fluxing ore, so that a very favorable smelting rate was obtained. First car brought \$2447.62 and the second \$2089.67.

Belorophon has finally struck the ore where the new tunnel encountered the fissure which outcrops prominently through the property. This is at a depth of 100 ft., and the tunnel is now in 280 ft. They are 12 ft. in the fissure, and have not yet reached the hanging wall. The tunnel is cross-cutting the fissure at right angles. The foot wall is quartzite and the hanging wall has not yet been determined, but will be either limestone or shale. The first of the vein matter encountered carried well in lead and silver, and as the work progressed further into the vein the values were changed to copper, silver and gold. They will probably crosscut until the hanging wall has been reached, then drift north along the vein. The mineralization is much stronger on the north side. This will also give depth as the work progresses.

Eureka.

Because the smelter has refused any more than 50 tons per day at present from the Eagle & Blue Bell Co. it has decided that during this lull is an opportune time to sink from the 1700 level to the 1850, and work was started the first week in July.

A vein carrying values in silver and lead has recently been opened on the Eureka Lily property. It was found by drifting several hundred feet on the 500 level and is about 10 ft. wide. It is of quartz and is now being explored. The vein is well defined and is in sight for some distance beyond the cave that was first encountered when the work was resumed in the drift. The fissure was caught on its dip from the workings above at about the angle that was expected. Since this development took place drifts have been started to the north and south and at present there is some lead ore showing in the north drift. It has been decided to thoroughly explore the ground from this working.

July 7 work was started in sinking a 2-compartment shaft on the Homansville property by the Chief Con. Co. It will be used to develop a large block of ground recently acquired by Chief. For some time grading for the shaft has been under way. New machinery is now in place, the headframe and all shaft equipment ready for use. An electric hoist is to be used. The sinking of the shaft has been contracted to W. Fitch, Jr., who is carrying on extensive operations under contract for a number of Tintic mines. The drifting in the R. G. W. property, now a part of the Chief Con., is to be discontinued as soon as the sinking operations are well under way. An electrically driven compressor plant has been in use in its Homansville or East Tintic work for several months and will furnish air for the shaft work.

Cottonwood.

According to Manager T. W. Bell the Big Cottonwood Coalition Co. has its incline shaft down 150 ft. on the vein. Ore has been showing all the way, but recently miners have struck high-grade. About 20 tons have been broken and a shipment will be made soon. The main tunnel is in 1000 ft. and has a depth of 550 ft. Three fissures have been cut. The first one was encountered at the 400 point and shows small silver and copper values. The second one at 550 ft. is 3 ft. wide and shows lead, silver, gold and copper values. The third fissure was cut at 950 and is 2½ ft. wide and shows zinc, lead, silver and copper values.

WASHINGTON.

Spokane.

The Laurier Mining Co., which owns and operates the Laurier mine, on Huckleberry mountain, near Laurier, a station on the Kettle river valley branch of the Great Northern railway, is shipping 2 cars of ore weekly to the Granby smelter at Grand Forks, according to E. K. Erwin, secretary of the corporation. Erwin states that the shipments, extracted in development, average 5 to 6% copper and 3 to 3½ ozs. silver, and that the net returns are about \$25 a ton. "Until we get a larger compressor installed we will have to limit our work. At present we are confining activity to sinking the incline shaft to connect with the No. 1 tunnel, to which it already has been joined by three upraises. For its entire length the shaft follows an ore body 8 ft. wide, all of which is being extracted, so that our shipments show its exact average value. Lying above this ore body is another shoot of unknown extent and entirely different character. Wherever it has been broken into a highly complex material has been exposed, the average values running 2½ to 3% copper, 10% each lead and zinc and 30 ozs. silver. This is much richer ore than the body we are mining, but as it is unmarketable in its crude form we are not exploring it now."

The Columbia Copper Co., capitalized for 1,000,000 shares at \$1 each, has been organized by Spokane men to take over and operate the holdings of the old Highgrade Mining Co. in the Deer Trail district of Stevens county. C. M. Carroll is president, Alex Robinson is vice-president and general manager, Oscar Olson is secretary-treasurer and T. J. Vaughan Rhys is consulting engineer. The purchase price of the group is \$100,000, payments extending over a period of 10 years. "This is one of the old-time holdings on which large sums were expended years ago," said Robinson. "I believe the owners built a smelter on which I am informed they spent \$114,000. It never was of any value to the mine, but there still is some good machinery on the ground, consisting of boilers, engines, blowers, etc. Carson Bros. and other farmers of the Reardan section were the former owners. By this deal we have acquired a group of copper properties which may develop into one of the big mining enterprises of the state. We have 9 ft. of solid copper ore. We have sorted and hauled to the railroad at Davenport a carload which will run from 10 to 24%. When these estimates and our sorting are verified by the smelter returns we expect to let a contract for hauling this ore to the railroad and then will ship at least a carload a week. We have put up buildings and have 8 men now at work in the mine."

WISCONSIN-ILLINOIS.

Platteville.

Ore deliveries for June up to and including the 21th, were reported by districts as follows:

Districts:	Zinc, lbs.	Lead, lbs.	Pyrites, lbs.
Benton	17,282,000	206,530	
Cuba	4,668,000		2,556,600
Mifflin	4,662,000		
Galena	4,492,000		
Hazel Green	3,544,000	66,400	
Linden	2,642,000	250,960	
Platteville	2,212,000		
Montfort	816,900		
Shullsburg	694,000	135,300	
Highland	314,000		
Mineral Point	114,000		
Potosi	70,000		
Totals	41,510,000	659,190	2,556,600

Surplus ore was sold the latter part of the month, the bulk being low grade, to concentrating plants, but there remained in the field, conservatively estimated, about 8000 tons of concentrates. Shipments of high-grade ore direct to smelter exceeded 20,000,000 lbs. for the month. The New Jersey Zinc Co. delivered one-fourth of this from its refineries at Mineral Point to smelter at DePue, 66 cars, 5,012,000 lbs. The National Separators and Wisconsin Zinc Co.'s plants contrib-

uted 100 cars, while considerable high-grade was sent from mines direct to smelters.

Reports showing deliveries for week ending the 8th reveals unusual activity in shipments, 122 cars of zinc ore reaching track, 4926 tons; 3 cars of lead ore, 200,000 lbs.; 9 cars pyrites, 825,800 lbs. The actual recovery of concentrates during week fell off considerably and much reserve ore was worked off. Net shipments of high-grade separator ore to smelter, 5,100,000 lbs. The Mineral Point Zinc Co. delivered 16 cars of refinery ore to smelter at DePue, 1,224,000 lbs.

There was no change in the offerings on blende over the figures of the week before, top grades selling on a base of \$67 to \$68, with the range down to \$62 for 50%. More buying of low-grade ore by the New Jersey Zinc Co. enabled independent operators to get into the market.

Local producers were in evidence on the returns, the East End mine shipping 3 cars to Galena, 132 tons; Hodge mine to Cuba, 2 cars, 85 tons; M. & H. Mining Co., 1 car high-grade to LaSalle, 44 tons; West Hill to LaSalle, 32 tons; Kistler Mining Co. to LaSalle, 2 cars, 88 tons.

Cuba.

The Linden Zinc Co. is operating the Campbell Magnetic plant at this point with a force of 20 men. National Separators received 707 tons of green concentrate last week and reported out to Illinois Zinc Co. 2 cars 60% ore, 74 tons; to Granby Mining & Smelting Co., 7 cars, 290 tons; to Eagle-Picher Lead Co., 1 car, 37 tons.

Benton.

Shipments last week were below average, only 40 cars of zinc ore reaching track, 3,438,000 lbs. The Hird mine is included with an initial shipment. Development was undertaken on this property 4 years ago, the Frontier Mining Co. at one time spending \$1500 monthly for power on pumps alone. A new 200-ton power and concentrating plant now in running order has been delayed in service. The lease includes 160 acres, and two additional ranges have since been determined with drills on the same tract, making it one of the richest in the field. The ore will not run high, but is of a uniform grade and in heavy quantities.

Shipments of high-grade ore came from the Benton Roasters, 3 cars to LaSalle, 135 tons; Wisconsin Zinc Roasters to LaSalle, 2 cars, 99 tons; to American Zinc Co., 4 cars, 179 tons; Edgar Zinc Co., 3 cars, 127 tons.

Hazel Green.

Shipments continue from regulars only, Kennedy, 2 cars, 86 tons; Cleveland, 4 cars, 183 tons; Lawrence, 1 car, 42 tons, all to Mineral Point, and Lawrence to Wisconsin Zinc Roasters, 2 cars, 76 tons.

Galena.

Ore deliveries for week of the 8th were heavier than usual, 19 cars reaching track, 1,484,000 lbs. Two new producers figured in the returns, the Coleman and Nickpencross, each 2 cars to Cuba, 176 tons all told. Two others are in shipping order, the Graham and Birkbeck. Ten cars high-grade ore cleared from refinery plants.

Cuba City.

A new plant released by the Galena Iron Works Co. to Standard Metals Co. is in fine running order on the new Anthony mine. Five shafts are complete and down to ore beds on deposits blocked out with drill 2 years in advance. The mill will be able to handle 100 tons each 12 hours. Motive power is furnished by two 4-cylinder, 40-hp. gasoline engines for hoists and compressors, and the mill is operated by a 66-hp. automobile engine. Kerosene oil feed is being used satisfactorily. Heavier pump equipment, it is thought, will be required. The company acquired the Dall lands, and pumps are now being installed. One hundred and twenty acres of land under lease to Anthony Selleck and Hooper, local operators, has been optioned by the company, and contracts for 12 borings at likely points. A new 100-ton mill will be built here. Another mill is now being rebuilt for the company on the Gritty-Six mine, an old-time producer, to be ready by Sept. 1. Longendyke, Smalley, and others, of Cuba, have secured mining rights on the Carr land, adjoining the once famous Baxter property. The mine has been unwatered and a small concentrating plant is in operation. The ore is

coming from a pitch 5 ft. thick and from 60 to 70 ft. wide, of exceptionally high-grade zinc content.

The National Separating Co. shipped last week 4 cars to Illinois Zinc Co., 164 tons, and 8 cars, 326 tons, to Granby smelters. Low-grade receipts were light, only 12 cars reaching the plant, 526 tons. Utt-Thorne Co. delivered 6 cars low-grade to Benton Roasters, 240 tons.

Highland.

Shipments of carbonate zinc ore last week came from the New Jersey Zinc Co., 4 cars to Mineral Point, for oxide making purposes, 105 tons; 1 car from Muldoney & Co. to DePue, 30 tons.

Linden.

Ross Bros. Mining Co., Optimo No. 2 and Optimo No. 3, and the Saxe-Pollard mines shipped all told last week 9 cars of concentrates, 335 tons. Production continues with all producers in this district, and two new shippers are anticipated within the month.

Recent strikes with drill on the Gilman mine assure production of zinc ore for 5 years to come at least. Efforts are being made to locate the original range of Optimo No. 1 mine, which has been succeeded by Optimo No. 2 and Optimo No. 3, each fully equipped and in operating order. The Silver Dollar mine on the Tolmes farm is being explored with drills and a shaft is down to ore level. Kletsch Bros. of the Republican house, Milwaukee, are engaged with drills on the Ovitz farm in Linden township. Kletsch Bros. have been operating the Lucky Six mine at Mifflin for the past 5 years successfully.

Mifflin.

The Grunow, Phoenix, B. M. & B., Biddick, Coker and Rundell mines reported ore deliveries last week, 12 cars, 473 tons. Considerable reserve ore was carried over. New producers are rounding into shipping form. Mineral Point locals delivered small lots, 23 tons in all. Dodgeville district made no shipments, but several hundred tons of ore are held awaiting bids. The O. P. David at Montfort shipped last week 1 car high-grade to LaSalle, 44 tons.

Shullsburg.

The Winskill mine on mine run ore coming from new deposits in the glass rock strata shipped 5 cars last week to Galena, 179 tons. This district is experiencing a real boom, two-score drills being engaged in prospect work alone.

WYOMING.

Casper.

The Midwest Refining Co. is receiving 3 cars of oil daily from the Hudson Oil Co. The Hudson Co. had its tanks full when order was placed and it was expected that the production would not run high enough with the present wells to keep up the 3 cars a day shipment. However, the storage has not been run down and the wells apparently are producing 3 cars a day. Midwest has also received 4000 barrels from the Wyo-po Co. in the Dallas field for trial. If it proves satisfactory and a price can be arranged shipments will continue.

The Merritt Oil & Gas Co., Duluth, drilled into oil sand on its leased land in section 3, T. 33 N., R. 76 W., 15 miles south of here, and in what is commonly known as the Big Muddy field. The top of the pay sand was encountered at 970 ft., in the Shannon sand, and in less than 2 hours the well had filled up 400 ft. in a 10-in. hole. According to T. A. Merritt, president, the present production will not exceed 10 or 50 barrels a day, but other operators near where the well was brought in declare that it will reach 100 barrels.

CANADA.

BRITISH COLUMBIA.

Camborne.

A \$75,000 lease and bond has been taken on the Revenue group of lead-silver claims, 5 miles from the upper end of

Upper Arrow lake, by W. D. Poole of Spokane and associates. The holdings consist of four claims, owned by William Boyd. Considerable development has been done on the properties, and Poole states that there are more than 100 tons of ore now on the dump that runs 60% lead and 30 ozs. silver. The veins are opened by two tunnels, one 100 ft. long and the other 150 ft., besides a series of open cuts. Poole announces that extensive development and exploration will be inaugurated as soon as men and supplies can be assembled.

Nelson.

The Granite-Poorman mine at Beasley, near Nelson, has been bonded to Butte and Spokane capitalists. The first payment of \$10,000 was made recently to Dr. W. H. Willson, Barney Crilly, Thomas Gough and H. Y. Anderson, who have a lease and bond on the mine and have been operating it profitably for some months. They had it under lease from the Kootenay Gold Mines, Ltd., which holds the titles. The purchasers under the new bond are John McGinnis, Butte; W. E. Cullin, and R. A. Carnochan, Spokane. The deal was put through by A. G. Larson, who took an option on the mine. A new company is to be organized under the bond and it is stated that the plans for the future include remodeling the 20-stamp mill with which the mine is equipped. Work in the mine will include the unwatering of the workings of the Poorman vein and the development of that vein. The Willson-Crilly syndicate has been operating since January on the Hardserable vein where a shaft opened up some high-grade ore, which has given splendid returns through the mill. Last month the syndicate is said to have made profits which will run close to \$20,000 when the complete clean-up has been made. F. H. Skeels of Spokane has arrived to take charge of the mine for the new operators. He is an engineer of wide experience in the Coeur d'Alenes and Montana. The Granite-Poorman has been one of the most consistent producers of gold from free-milling ore in the Nelson district. It has been in operation, with the exception of a short period, for many years. It was sold to the Kootenay Gold Mines, Ltd., by Thomas Gough, the late John Swedberg, E. E. Guille and associates and was operated by the company for several years. Financial troubles caused the company to cease work. It then gave a lease to the Willson-Crilly syndicate, which has been operating it for nearly a year with good results.

The Erie mining district, about 30 miles from Nelson, is attracting considerable attention from investors, and representatives of American capitalists recently have been examining the mines of the region with a view to securing leases and bonds on the more promising groups, according to Fred A. Starkey of Nelson, president of the Association Boards of Trade of Eastern British Columbia, who personally has been investigating conditions there in recent weeks. "One of the most promising properties of the district, the Arlington gold-silver group, is being negotiated for. The mines, formerly owned by an English syndicate, are credited with a production in excess of \$800,000. They were leased 2 years ago, and it is said that the leasers made a considerable profit, but, owing to insufficient capital to properly develop, they confined their efforts to extracting the ore in sight, and eventually possession reverted to the owners. The Second Relief group, also in the Erie district, is being extensively developed, and today it is in better shape to produce than ever before. In the past the different owners of this property made it pay well, but the present management is having difficulty with the new mill recently installed. It was anticipated that the equipment would successfully treat the refractory ores and make a full saving of the gold and silver values, but since the plant was put in commission it has been discovered that radical changes in the system are necessary. Manager Westly hopes to have the remodeled mill in operation soon, however, and before many months it is believed that the company will be paying dividends. The Keystone property, another old timer, which several years ago produced heavily and at a good profit, has been bonded by a local syndicate. Development has revealed new ore bodies and arrangements now are being made to enlist more capital to put the mine on a producing basis. Shipments made to the Trail smelter in a former period of operations returned from 3.98 to 5.28 ozs. gold to the ton,

together with fair values in lead and silver. Plans are under consideration to equip the property with a concentrator and increase the output to the maximum. The Lion and Eagle claims and the Norway group already have been bonded by men who are in position to develop them, and several other groups have been transferred. There are deposits of almost any mineral desired in different parts of this great region, the values appearing in combination as copper-gold, gold and silver and lead-silver-zinc, and there are all the natural facilities for mining operations at hand. There is unlimited water power that can be harnessed at small cost and an abundance of timber for all purposes. The only thing lacking to make this one of the most important mineral producing sections in western Canada is capital, and this we hope to secure soon."

Ainsworth.

The Florence Silver Mining Co., which is developing the Florence group, shipped 2 cars of ore and 3 cars of concentrates to the Consolidated Smelting Co.'s smelter at Trail, last week, according to Ferd R. Wolfe, president and general manager. The crude shipments will average about 50% lead and 20 ozs. silver, and the concentrates around 60 to 65% lead and 25 ozs. silver. The week's production will net not less than \$12,000. Sixty tons of ore are being milled daily, all the ore coming from development work on the south vein, which is now being opened. Good progress is being made in the lower tunnel.

Smelter returns received by the Florence recently show net values of about \$70 on 60% concentrates, the settlement being on the basis of \$8.10 to \$8.13 for lead at the Montreal quotation and around 69 cts. for silver at the New York quotation.

ONTARIO.

Cobalt.

The Trethewey Co., operating the Rochester mine at Brady lake, has drifted 100 ft. on the vein of high grade which they recently encountered on the 300 level. Good ore shows the entire distance in the drift. Part of the distance the ore is a high-grade smaltite. The character of the vein has now changed, and it is a calcite with ruby and native silver. The management now intend sinking a winze on the vein to find out the depth the values persist to.

Since all Lake ore is now being trammed to the No. 7 shaft of the Townsite mine, where it is hoisted for treatment in the mill of the Cobalt Reduction Co., the Cobalt Lake mill of the Mining Corporation of Canada has been closed. The company intends using the old City of Cobalt shaft for raising and lowering men and materials. For the present the old mill will remain idle, but the ultimate intention is to use it to house a flotation plant for treatment of tailings. The mill was built in two units, the first being erected in 1912, and consisting of 20 stamps, the second addition of 20 stamps was made in 1914.

The Buffalo Mines, Ltd., is contemplating the treatment of its flotation concentrates on the property. The process will be similar to that at the Deloro smelter now treating Cobalt ores. No new equipment is being installed with the exception of a roasting furnace and accompanying dust collectors. The furnace is a large 2-chamber type, measuring over all 16 by 8 ft. It will be equipped with burners for crude oil. The ore is mixed with the necessary proportion of sodium-chloride and roasted in the furnace, being continually rumbled by hand during the process. By this roasting the silver forms silver chloride, which is successfully treated by the cyanide process, which the Buffalo has had in use for several years. As the output from the flotation plant in concentrates will be about 30 tons a day, both freight and treatment costs will offer a saving.

Crown Reserve has made a find on the 700-level, 200 ft. below any of the old workings. Manager Stewart decided to sink a winze on a vein on the 500 level. At the 700 level Keewatin was encountered and drifting commenced on the vein with the above result. The vein is 12 ins. wide and is composed mainly of smaltite with some calcite and native silver. As far as known it is in Keewatin-diabase contact. Stewart is strongly of the opinion that the vein will hold in the lower formation, and intends continuing work. The continuation of the work on this vein will be of interest, as it

has previously been found by different mines in the camp that little of value is to be found in the underlying Keewatin.

Porcupine.

A 2-drill compressor has recently been added to the equipment of the Keora mine for sinking the shaft to the 110-ft. level. The shaft is now down over 80 ft. For the last 20 ft. they were in ore all the way with neither walls in sight. The shaft was sunk at some distance in the foot wall on account of the dip of the vein. The latter was caught at a depth of 60 ft. The ore is of a fair milling grade. Good progress is being made since the compressor plant was installed and two shifts are working. A new headframe has been built, the shaft timbered and all buildings put in shape. They plan to continue sinking and at greater depth crosscut to the vein. At the angle of dip it is expected that the vein will not cut out of the shaft for another 20 ft.

MEXICO.

Santa Rosalia, almost wholly owned and officered by Michigan men, is a property that seems to have considerable merit. This property is located about 100 miles from the Arizona border, about 6 miles from the old town of Arizpe in Sonora, and its fissure vein, which carries principally gold with some silver, lead and zinc, has an extent of $3\frac{1}{4}$ miles. In the old Mexican days before the advent of the "gringo," it produced several millions of gold, but was shut down about 80 years ago, on account of a sudden influx of water. In 1886, John Daggett, at that time superintendent of the U. S. Mint at San Francisco, organized a company of 100,000 shares, of which 51,000 were taken mainly by employes of the mint at 18 cts. a share, to be paid for in monthly payments, and the remaining shares were given to the locators as the purchase price of the mine. It was a close corporation, no stock being sold to the public, and no salaries were paid the first year. Considerable ore of high values was taken out, values less than \$600 a ton being rejected, as it had to be hauled by wagon 75 miles, and then shipped by rail to Nogales. It paid dividends at the rate of 10 cts. monthly. Afterwards it was taken over by parties in Watertown, N. Y., and the present secretary of state, Robert Lansing, was a director. It came into the hands of the present owners some few years ago, and in Madero's time was worked up to his assassination, when it had to be closed down and could not be opened, owing, of course, to the internal disturbances. At that time 7 tons were taken to Douglass which yielded \$7300. There is a shaft 700 ft. in depth with over 4000 ft. of workings. There are authorized 500,000 shares, but only 284,000 have been issued, and there is \$10,000 in the treasury, with all the debts paid, and \$10,000 more due from delinquent stockholders. The officers are E. D. Johnson, president; Oscar Bruns, secretary; F. H. Kohlhaas, treasurer; Will Harris, John Gibbens and Harry Hill—all of the copper country; C. A. Phelps of Watertown, N. Y., and M. L. Stevens of Montreal are the remaining directors. The company which is organized under the laws of Arizona is a holding company for the Mexican company.

According to George Kingdon, general manager of the Greene-Cananea, the company's property is not in the hands of the Mexican government. He says: "When I left Cananea I put a man in charge of the property and authorized him to continue operation there in both mine and smelter. He is proceeding with this work in the capacity of a representative of the Cananea Con. Copper Co. and not as a representative of the de facto government. Further than this, General Calles has given assurances that all the copper produced at Cananea under the present arrangement will be delivered at the border line at Naco, as in the past." J. S. Williams, Jr., manager of the Moctezuma Copper Co., and L. R. Budrow, manager of the El Tigre, explained the situation in much the same way. Both said their store had been seized by the Calles government, as they were needed, but the mines have not been molested. Mexicans are now running the Nacozeri plant. At El Tigre minor repairs are being made. General Calles has taken no action to indicate the radical step reported from Mexico. If General Carranza has ordered anything of the kind, General Calles has failed to comply.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

I. GEOLOGY

GEOLOGY AND MINERALOGY

Geology

Cox, G. H.; Dake, C. L.—*Geological Criteria for Determining the Structural Position of Sedimentary Beds*. [Various marks left on sedimentary deposits are taken up with some structural phenomena of igneous rocks].—Bull. Mo. School of Mines; May 1916; pp 59*.

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Business in copper in the past few days has been of an unimportant character. In fact, the amount of metal sold has been so small that the market is wholly dormant. Prices have shown further slight recessions, but have not indicated any signs of weakness in the market. At London, on the other hand, the standard market has been falling sharply. Some copper authorities are beginning to give vent to utterances of warning. They point out that unless sales for forward delivery are equal to 75% of the future output the maintenance of prices will ultimately prove harmful in that copper instead of receding gradually will fall acutely, solely because of the efforts to sustain prices over a protracted period of inactivity. Other copper factors, however, are confident of the future of the metal. All signs point to another year of war. The reports of the belligerents betray no hope for an early peace and with another 12 months' heavy foreign consumption of copper, and, likewise, domestic absorption, it is contended that copper cannot only be sustained above the 25-ct. level, but will progress beyond the 30-ct. mark as soon as a general buying movement sets in. It is noteworthy that even the large copper producers are not resorting to over-optimism. They all recognize that inflation can easily displace the present firm situation and on every hand there are signs of careful nursing of the market.

Resellers lowered their prices to 26 cts. for spot electrolytic and 25 $\frac{1}{2}$ cts. for futures and in one or two instances prices $\frac{1}{4}$ ct. under these figures were noted. There are some second hands who still hold to 26 $\frac{1}{2}$ cts. for spot and 26 cts. for futures, however. Among the producers it is difficult to secure actual market quotations. The figures mentioned off-hand by the large sellers are not actual market values, but by means of inquiries directed among large consumers it has been established that important first hands are willing to sell September electrolytic at 28 $\frac{1}{2}$ cts., October at 28 $\frac{1}{4}$ cts., November at 28 cts. and December at 27 $\frac{3}{4}$ cts. One wiredrawer reported being offered a round lot for the fourth quarter at 26 cts. Casting copper for spot delivery is held at 24 $\frac{1}{2}$ cts. and futures at 24 cts. by second hands. One producer is not offering beyond September on expectations of an improved market by August. To a certain extent consumers are wholly favorable to the continuation of high prices. Wiredrawers, casting interests and brassmakers who bought copper above 25 cts. and delivery over the third quarter did so on the belief that the market would be sustained and that they would have no difficulty in selling their finished products at the high prices that high casting copper would command. Several

sheetmakers this week lowered their prices $\frac{1}{2}$ ct. to 37 cts., but others are still holding for 37 $\frac{1}{2}$ cts. Copper wire is firmly held at 32 cts. A slump in copper at this time would severely affect domestic manufacturers of copper products, as they could not support their prices with the basis of copper lower.

While standard copper at London has been volplaning, American electrolytic has only declined moderately. This appears to indicate the power of the English government to control the standard market and the ability of the American producer to ignore the standard fluctuations. Standard declined £12 in spot and £11 in futures last week, with electrolytic only £3 lower. At the opening of the current week standard dropped £7 in spot and futures, with electrolytic off £1.

Quotations for copper per pound at New York for the week ended July 12 were as follows:

	Lake.	Electrolytic.	Casting.
July 6.....	27 @27 $\frac{1}{4}$	28 @27 $\frac{1}{4}$	24 @24 $\frac{1}{2}$

Tin.—Under the adverse influence of heavy stocks the spot tin market has been steadily receding, and futures, after holding firm for a while, have latterly become easy, principally on weakness abroad. The detailed statistics for the month of June were not entirely favorable to the metal and consumers have indicated their belief in lower prices by remaining out of the market. Spot tin declined to 38½ cts. for Straits and 37¼ cts. for Banka. These prices are about 1 ct. off from those prevailing at the beginning of July. New business has been sparse, orders developing only from the cheaper offers of sellers. The situation in the metal furnishes no incentive to buy. Large supplies are en route, adequate stocks are held here by sellers, while the large consumers hold from 2 to 3 months' requirements in store at their plants. Moreover, the apparent freedom in the movement of tin from the Straits via the United Kingdom has removed the baneful influence of the constant holding up of export permits. It is noteworthy to point out that while Straits spot is quoted at 38½ cts., sellers are asking 38 cts. for December delivery, the difference of ½ ct. between these two positions reflecting the weakness of the spot position and the firm attitude taken by sellers on futures. Straits tin for July delivery was held at 38¾ cts., with August held at 38¼ cts., September at 38¼ cts. and October, November and December at 38 cts.

The detailed statistics showed the total visible supply on June 30 to be 19,363 tons, a decrease of only 249 tons in the month. Straits shipments totaled 6210 tons. Stocks at consuming ports at the end of June totaled 7124 tons, a gain of 365 tons over the stock on May 31.

Foreign markets last week were rather erratic, but at the opening of the current week the London market declined sharply, Singapore following on Tuesday with a sharp fall. The losses early last week were recovered by the close. On Monday Straits tin at London declined £3 to £171, and standard also suffered a drop of £3.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended July 12 were as follows:

	New York		London		Singapore

Lead.—The trade had an unpleasant surprise last week when the American Smelting & Refining Co. announced a cut of \$10 a ton in its prices. It had been expected that if any change was made it would be upward, as a good business has been done in June and prospects were bright for active buying in July. It develops, however, that foreign buyers indicated that they would not be in the market this month, and in view of the quiet domestic business a price reduction was decided upon. The cut brought quotations down to 6.50 cts. New York and 6.42½ cts. St. Louis, and interests in the outside market began lowering prices below the so-called official, so that at this writing they stand 10 to 17½ points below the A. S. & R. Co. quotations. Independents are offering spot lead at 6.40 cts. New York and 6.25 cts. St. Louis. An unusual development was the offering of lead for delivery up to November by speculators, who asked 6.20 cts. for August and 6.15 cts. for September, October and November. The situation in lead is furnishing discussion. Present prices are only a few cents above normal levels and with another year of war it is pointed out that chances are good for another rise. Speculators are on the brink and from the present outlook

some large speculative buying may soon be done. The future offers are thought to be a prelude to a speculative movement. Producers may not, however, care to sell well ahead at the present low prices, owing to the uncertainty of the ore market. At London the lead market has declined moderately, receding 15s in spot and £1 in futures last week.

Quotations for lead per pound at New York and per ton at London for the week ended July 12 were as follows:

	New York		London

Lead Ore.—The general decline and slump in the spelter market is having its effect on the prices of ore in the Missouri-Kansas-Oklahoma district, as was noted by a decline of \$2.50 during the week ended July 8. The better grades brought \$75, while the range went down to \$72. There were produced during the week 1,154,970 lbs. of concentrates, which brought the total production of concentrates for the year to 57,149,042 lbs. The values were respectively \$12,169 and \$2,535,897, all figures being based on the 80% metallic content.

Zinc Ore.—The dormant state of the week ended July 1 in the ore market in the Missouri-Kansas-Oklahoma district developed into a weak condition and prices during the week ended July 8 were down \$5 to \$80 per ton on a basis of 60% metallic content. This price ranged down to \$60 as during the previous week. There were produced 11,939,360 lbs. of concentrates valued at \$120,416 and the total for the year to that date was 374,245,551 lbs. valued at \$17,701,696.

Calamine.—A \$5 drop was noted in this class of zinc ore and sales were made at from \$10 to \$55, at which price the ore seemed to be in fair demand. Concentrates produced were placed at 64,010 lbs., valued at \$1440, which made the total for the year to date 18,875,280 lbs., valued at \$701,473.

Spelter.—For the first time since April, 1915, prices on spelter have gone below 10 cts., and with spot now offered at 9¼ cts. New York and 9 cts. St. Louis, the receding movement shows no signs of having been arrested. The spot market is very weak and dull. Consumers are using high-priced spelter and have sufficient worries from this score. The present range of quotations makes the subject of futures an active one. Spelter for August delivery is held at 8.25 cts. and for September at 8 cts. St. Louis. On the basis of these values it is argued that spelter for the fourth quarter ought to be had at an average of 7 cts. As such a price would be only 1 ct. above the normal, consumers are showing a strong desire to buy. Producers on the other hand are limiting business and will not consider futures at all. They indicate that ore prices are uncertain and for them to sell heavily for the fourth quarter on the basis of present prices would be foolhardy. Consumers, however, are steadily pressing smelters for fourth quarter quotations. Violent declines at London have tended to accentuate the depression in spot here. Last week spot spelter dropped £17 and futures £14, opening the current week unchanged in spot at £44 and £1 lower in futures at £40.

Quotations for spelter per pound at New York and per ton at London for the week ended July 12 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—Prices have advanced moderately on a continued active demand. Sellers are securing \$83 a flask for virgin spot, an advance of \$3 since our last report. An advance of £1 in quicksilver at London, making the price £17 15s, caused additional firmness here. Business is of good volume, but lacks the element of sensationalism that characterized the last upward movement when the price touched \$300 a flask. It appears that large sellers are closely controlling the metal and not allowing speculators to obtain any large amounts. There is still some quicksilver held by bankers, but it is now reported that these holdings are for the account of a large powder maker and will not be put on the market. Foreign demand continues of fair volume, with orders being received from Scandinavian neutrals.

Antimony.—This metal remains in the slough. Sellers are unable to attract any business, but have endeavored to hold up prices. Thus while Chinese and Japanese are asking 16½ cts. for spot, it would not be difficult to shade to 15 cts. The market is weak, dull and heavy, and it is known that Asiatic producers hold large stocks here and have considerable amounts afloat that are unsold.

Finished Copper, Brass and Other Products.—Makers of zinc sheets announced another reduction last week, putting the price down to \$17 per 100 lbs. Copper sheets have been lowered by some makers to 37 cts. Lead products are unchanged, but a reduction is looked for. Following prices are all f. o. b. mill:

Sheet zinc	\$17.00@
Sheet aluminum, 1917 contract	40.00@
Sheet aluminum, outside market, prompt shipment	85.00@100.00

Copper wire	32.00@	33.00
Sheet copper, hot rolled	37.50@	
Sheet copper, cold rolled	38.50@	
High brass sheet, wire and rods	38.00@	39.50
Low brass sheet, wire and rods	39.50@	42.00
Bronze sheet and wire	46.00@	42.00
Bronze rods	40.00@	42.00
Brazed brass tubing	45.00@	46.50
Brazed bronze tubing	46.00@	47.00
Seamless copper tubing	44.00@	45.00
Seamless brass tubing	43.00@	44.00
Seamless bronze tubing	44.50@	
Full lead sheets	9.25@	
Cut lead sheets	9.50@

Electric Arc Welding Finds Many Uses in Mines and Mills

By J. A. SEEDE.*

Electric arc welding is rapidly finding many uses in machine shops, steel works and in mines. With the severe usage characteristic of the service in mines and smelters, the arc welding equipment should find many uses, and undoubtedly will form a very useful part of shop equipments in the near future.

All commercial arc welding is done with either carbon or metallic electrodes, taking power from constant

kinds of work, especially non-ferrous welding, require the use of fluxes.

In all classes of welding the test of the work is its quality, and the operator is largely responsible for the successful production of good welds. The generating equipment should be of ample capacity to maintain a

FIG. 1. PORTABLE ARC WELDING EQUIPMENT.

current or constant voltage equipments. With carbon electrodes all kinds of work can be done, from the lightest up to work taking 1000 amps. or more, the latter referring principally to cutting, as it is very seldom that more than 500 amps. can be used for even the heaviest welding. The metallic electrode welding may vary from 30 amps., or even lighter, up to 200 amps. for the heaviest work. The consensus of opinion seems to be that the best grade of work can be done with bare electrodes without fluxes, but there are many advocates of the use of fluxes, who state that many

steady voltage under the severe service imposed by this work, and so designed as to be free from sparking and overheating during severe overloads. The quality of the electrodes also affects the work, directly, and in general the electrodes should be of smooth texture, free from irregularities of all kinds and of uniform chemical composition.

An up-to-date arc welding equipment consists of a compound-wound, direct-current generator designed

FIG. 3. ARC WELDING SET, CONSISTING OF GENERATOR DRIVEN BY INDUCTION MOTOR.

to operate at some constant voltage from 60 to 75 volts, and arranged for any standard method of driving. The main control panel is usually provided with a welding circuit of full capacity of the equipment in addition to the customary field rheostats, instruments, etc., and each auxiliary welding panel is provided with a simple equipment consisting of control rheostats and automatic device for protecting the generator and the work in case of short circuit due to accident or carelessness on the part of the operator.

Equipments have been standardized by the General Electric Co. in capacities of 200, 300 and 400 amps. for portable work, and in capacities of 200, 300, 400,

FIG. 4. BROKEN TAPS REMOVED BY ARC WELDING EQUIPMENT.

500, 600, 800, 1000 and 1250 amps. for stationary work. While the small sizes are generally designed for one operator only, they can be used for more operators if the work is of a sufficiently light character, in which case the number of operators can be increased up to the capacity of the equipment, and this latter condition holds good for all capacities. In this connection it is interesting to note that for certain classes of work there seems to be a definite movement toward

installing large numbers of single operator equipments, instead of using large machines and a number of auxiliary panels. This movement seems to be based on the high cost of necessary heavy wiring work where leads must be carried long distances, and where only light work is to be done it is obviously advantageous to allow each operator to have full control of the volts

FIG. 5. ANNEALING BOX WITH HOLE WELDED IN CORNER, RIVETS BUILT UP AND PLATES WELDED AND FILLED IN AT JOINTS.

and amperes for his particular work. One of the disadvantages of having a large number of small machines is encountered where heavy welding or heavy cutting is to be done, in which case the single high-capacity equipment is much superior.

With the constant voltage equipment a series rheostat is provided to vary the current supplied the arc, and this variation is accomplished by cutting in and out various parts of the rheostat by means of a dial switch. In many installations no automatic protection is provided, but it is believed that the slightly increased complexity caused by adding this device is well worth the added investment on account of the insurance against error. Mistakes are inevitable, and there is a considerable loss of efficiency when it is necessary for the operator to walk even a short distance to restore

FIG. 6. GEAR CASE SUSPENSION LUG WELDED AND READY FOR USE.

the circuits to normal operating conditions, and the loss is considerably greater if several peaks should come at one time, in which case the entire circuit might be shut down for an appreciable period.

With a good automatic equipment the circuit will be broken as soon as the operator exceeds the current for which the equipment is set and the circuit will stay open as long as the operator holds the electrode on

FIG. 7. BROKEN GEAR CASE SUSPENSION LUG.

the work. As soon as the circuit is broken a small relay returns the circuits to normal operating condition without loss of time or inconvenience to other operators. If desired, a preventive resistance can be inserted in the line instead of breaking the circuit, and this resistance can be put in series with the arc before striking in order to prevent the initial rush or current sometimes taken by an inexperienced operator.

The relays and contractors above referred to are clearly shown in Figs. 1 and 2, the first showing the arrangement of the portable equipment. These are designed to stand up under the severe service met with in ordinary shop work and, as evident, makes a very compact arrangement.

In Figs. 2 and 3 are shown the control panel and motor generator set respectively for the 500-amp. equipment, this arrangement being characteristic of the stationary outfits.

One source of extreme trouble in many shops is the breaking of taps in the work, which frequently results in scrapping the part affected. With the arc

FIG. 9. SMALL SECTION OF LOCOMOTIVE FLUE SHEET, TUBES WELDED.

welding equipment it is a simple matter to remove these taps, and the total time will vary from 4 to 10 minutes, depending upon the size of the tap and location of the break. Such taps removed by welding up to and through a nut are shown in Fig. 4. When the break is below a certain distance from the surface of the work it is advisable to weld through a piece of pipe which is placed in the hole before starting the weld, and by such means 1-in. taps broken off 2 ins. below the surface have been removed without injury to the thread.

The life of a compound kettle at one time was determined by the appearance of a depression in the bottom plate, which would bag and then burn out, after which the kettle was scrapped. The kettles are now removed from their settings, the bottom plate partly cut out, and we obtain practically a new kettle by welding in a plate from stock that is kept for this special purpose.

The annealing of laminations for electrical machines must be done out of contact with the air and the containers are subjected to the severest kind of treatment, which results in their depreciating very

FIG. 10. STEEL ROLL WOBBLER WORN AND REPAIRED BY ARC WELDING.

FIG. 8. SMALL SECTION OF LOCOMOTIVE FLUE SHEET, TUBES IN PLACE AND READY FOR WELDING.

rapidly. In Fig. 5 we have one of these boxes which had the plates sprung apart at the joint on account of the rivet heads being burned off and a hole burned in the corner, all of which was easily repaired soon after the operator started work.

It is well known that street car equipments meet with hard usage, and in Fig. 6 we see a gear case sus-

pension lug, practically as good as new, after being welded in position after the condition shown in Fig. 7.

In the heavier work of steam railroading we meet one of the most important applications of arc welding, and one of which is meeting with the best of success. This is the welding of tubes in locomotive flue sheets, and in Figs. 8 and 9 we have a section of a standard locomotive flue sheet with the tubes ready for welding, and after welding, respectively.

In the still heavier work around steel mills there are many places where the arc welding equipments will return enormous dividends every year.

When a steel roll wobbler is worn, as shown in Fig. 11, it is dangerous and of little value, except as scrap, and it is interesting to see how the worn parts can be built up by arc welding, and at what a saving in labor and material the wobbler can be made practically as good as when manufactured.

It is obviously impossible to illustrate even a small percentage of the many things that can be done by arc welding, and these few examples are presented more as an indication of what has been done, rather than as an attempt to list all the possibilities of these equipments. Also these examples indicate what can be done in repair work, and practically nothing has been shown of the possibilities in regard to primary manufacture, where many of these equipments are operating very successfully in welding all kinds of steel shapes for various manufacturing purposes. The speed and safety of these equipments as compared to other types of welding equipments is especially notable, and it is doubtful if there are any other applications of electricity that are more useful and interesting than this.

June Iron Ore Record Shipments.

June iron-ore shipments from the Lake Superior region were 9,507,578 gross tons, the record month in the history of lake ore carrying. They exceeded those for May by 1,057,996 tons, then the record month, and were 58.32% greater than those for June, 1915. The comparative shipments by ports for May and for the season were as follows in gross tons:

	June, 1915.	June, 1916.	To July 1, 1915.	To July 1, 1916.
Escanaba	720,264	1,159,424	1,248,830	2,602,824
Marquette	363,637	539,327	547,002	1,154,140
Ashland	604,127	1,101,370	1,161,792	2,204,263
Superior	926,536	1,945,234	1,777,600	3,878,915
Duluth	2,146,501	3,116,665	4,295,811	6,325,990
Two Harbors.....	1,244,026	1,645,556	2,490,248	3,449,435
Total	6,005,091	9,507,576	11,521,283	19,615,567
Increase, 1916		3,502,485		8,094,284

The increase to July 1, this year, is 70.26%, which reveals the rate that is making for a record season's shipments. The Duluth and Superior percentage of the total to July 1, this year, was 52.01%, against 52.70% last year. The Escanaba proportion this year is 13.27%, as compared with 10.86% last year.

It is better to take pains to prevent an accident than to suffer pains as the result of one.—*Anode.*

Sinter Which Uses Crude Oil.

Gasoline and similar hydro-carbons have commonly been used for igniting ore, by-products or concentrates, in order to burn away the sulphates and other combustibles. The present high price of such fuel adds considerably to the expense of the process, making somewhat more noticeable a patent (U. S. 1,179,390) recently issued to John F. Austin of Monterey, Mex., and which has been assigned to the American Smelting & Refining Co.. This new type of sintering machine permits the use of crude oil as fuel. Moreover, the operation is practically independent of the amount of moisture in the ore, which may be treated when it is quite wet.

The device is here shown, in side elevation, and end elevation partly in cross-section. A train of moving palets carries the ore (F) beneath the sintering device, which is suspended from the upper framework by vertical rods provided with springs. The latter is free from the jar of the moving palets.

The sintering device proper embodies a series of inverted archlike sections made of refractory material. These are so suspended and fastened together as to

CROSS-SECTION OF SINTER USING CRUDE OIL.

form a sort of inverted trough, with the open side just above the traveling ore palets. The end sections of this trough are shaped like the one shown at the left in the detail view, their ends being closed by plates.

These end sections, therefore, form closed mixing and volatilizing chambers, the liquid fuel and air being fed in under pressure at 14 and 15 to the burner (J).

Tremendous heat is generated by the burner, and the flame produced is forced downward upon the ore along the open portion of the inverted trough, being helped by the exhaust through the wind box (H).

The combustible sulphates are ignited directly beneath the sintering device, and a sufficient temperature produced so that they continue to burn, helped by the downward exhaust, even after they have passed from beneath the sinter, and until all the combustible has been burned away.

The Flotation of Oxidized Ores

By O. C. RALSTON and GLEN L. ALLEN.*

As concentration of natural sulphide ores by the flotation process has met with such success attempts have recently been made to apply the process to the flotation of ores other than natural sulphides, and it has been thought best to publish a summary of the results so far obtained from the experimental work on oxidized ores at the Salt Lake station of the Bureau, in co-operation with the Department of Metallurgical Research of the University of Utah.

This paper is only an advance summary of the experiments on the flotation of oxidized ores. More complete details as regards the flotation of carbonate ores of lead will be given by the writers in a paper on that subject later.

Most of the experimental work in the laboratory has been with the oxidized ores of lead. Only minor attention has been given to the oxidized ores of zinc and of copper for the following reasons. Little success has been had with the zinc ores; many others are engaged in testing copper ores, so that there was no pressing necessity of experimentation with copper ores by the Bureau although an attempt is being made to co-ordinate the work of those who are willing to co-operate to that extent.

Sulphidizing and Flotation of Oxidized Ores.

Flotation of oxidized minerals depends upon a preliminary "sulphidizing" by any method that will convert at least the surface of the mineral particles to a sulphide of the metal. This step is followed by flotation of the "artificial" sulphide, which results in a concentration of the metallic values in the low-grade oxidized ore being treated.

The methods of sulphidizing that have been investigated are as follows: (1) by the use of hydrogen sulphide on either the dry or the wet crushed ore, (2) by the use of solutions of the various sulphides and sulpho-compounds of sodium, (3) by the use of solutions of the various sulphides and sulpho-compounds of calcium, (4) by the use of sulphur vapor, (5) by the use of a sulphureted oil, (6) with colloidal sulphur.

It has been found that treatment by some of these methods will form a film of sulphide over the surface of the particles of such minerals as lead carbonate or copper carbonate, whereas in other cases the mineral particles are sulphidized to the core. Other methods failed to give any results.

Carbonate of Lead Ores.

All of the above methods of sulphidizing have been tested on a great number of carbonate-of-lead ores. Some of these ores contained silver and some

lead as the principal metal. A number of the ores have been successfully concentrated, and others refuse to yield to concentration by flotation. In general, a high alumina content (acid soluble) in an ore seems to prevent the application of sulphidizing and flotation. The purpose is to give the main features of the flotation of oxidized ores of lead, as well as other ores.

In sulphidizing with hydrogen sulphide gas, as applied to the lead carbonate ores, it was found that the best method of applying the gas to a dry powdered ore was in a tumbling barrel with the gas inlet in the end. Sulphidizing in a glass bottle showed that the ore blackened quickly after the application of the hydrogen sulphide gas. On attempting to float out lead sulphide from the ore as soon as it had blackened it was found that a low extraction of lead was obtained and likewise a low-grade concentrate, unless the pulp was previously acidified with sulphuric acid. By acidifying the pulp, cleaner concentrates were floated, but the extractions of lead remained low. Only by prolonged treatment with hydrogen sulphide gas could the extraction of the lead be raised to commercial grade. With a number of ores 8 hours' treatment gave an extraction of over 80% of the lead.

The use of hydrogen sulphide was considered for the reason that it can be generated quite cheaply. With iron matte available at \$5 to \$10 per ton, and sulphuric acid at from \$5 to \$10 per ton, the cost of the hydrogen sulphide resulting, including labor, etc., is between \$30 and \$50 per ton. If this gas in combining with the metal in the ore produces only a superficial film of sulphide, and does not penetrate to the center of the particles, it might be possible to make a ton of the gas sulphidize many tons of ore.

Unfortunately hydrogen sulphide attacks the metallic particles of the ore with such avidity that by the time the latter are sulphidized sufficiently to permit of good extraction by flotation, they have also been sulphidized to the core, and practically a chemical equivalent of hydrogen sulphide, to the lead in the ore, has been absorbed. Even coarse pieces of ore in a bottle absorb the gas with evolution of heat, and on breaking open the pieces, the black coloration is seen to have traveled deeply into the particles.

Owing to the fact that the value of the lead concentrates obtained is very low as compared to the amount of hydrogen sulphide necessary to sulphidize it, this process is not regarded as commercially practicable.

Application of hydrogen sulphide to the ground ore suspended in water does not seem to be subject to the same difficulty. True "filming" of the parti-

*Of Bureau of Mines.

cles with a film of lead sulphide seems to take place, and the extractions possible after a short treatment with the gas are satisfactory. The speed of travel of molecules of hydrogen sulphide gas, as compared with the speed of travel of the same molecules in solution affords an explanation of the difference in the action of the gas when applied to dry pulverized ore as compared to its action when applied to pulp suspended with water.

The best results on lead carbonate ores have been obtained when sulphides of sodium were used for the sulphidizing agent. The sodium sulphide must necessarily be introduced in solution and seems to cause true filming. The sulphides of sodium considered commercially applicable are the normal sulphide of sodium, Na_2S ; sodium polysulphides, Na_2S_4 and Na_2S_5 , and the sulphhydrate of sodium, NaSH . Of these, the latter, the sulphhydrate, seems to be very effective, as is evidenced by the quicker blackening of the pulp, and the deeper, blacker color formed. The normal sulphide is almost as effective; the polysulphides seem to be the least active. Different ores require 10 minutes to 24 hours of contact with the solutions of sodium sulphide used, depending on the properties of the ore and on the strength of the solution of sodium sulphide. Amounts of sodium sulphide varying from 10 to 20 lbs. per ton of ore are usually sufficient, and should be applied to pulp containing about one ton of water per ton of ore, in order that the solution may be as strong as possible during the sulphidizing stage of the process. After a good black color has developed, and the color has ceased to increase in blackness, the pulp is diluted with water to a 3:1 or 4:1 mixture and floated in either mechanically agitated or pneumatic machines. The market for sodium sulphide is limited and it should be obtainable at considerably less than 2 cts. per pound.

The polysulphide of calcium, obtained by boiling powdered sulphur with slacked lime, seems to be satisfactory for ores that yield easily to sulphidizing, but is sluggish in its action, as compared to the sulphides of sodium. The normal sulphide of calcium is only slightly soluble and hence its use was discontinued as a possible sulphidizing agent. The sulphhydrate of calcium is the most active of these reagents, but has not been tested to any extent in this work, and there is doubt as to whether it would be commercially feasible to prepare such a compound.

Sulphidizing with sulphur vapor has been tried with little success, for the reason that it must be applied at a temperature above the boiling point of sulphur in order to prevent condensation of the sulphur. This means that the ore must be heated to a temperature above 445°C . There seems to be no difficulty in obtaining elemental sulphur vapor commercially, as pyrite will give up half of its sulphur content when heated in a closed space, and sulphur dioxide gas can be reduced to elemental sulphur by

passing it through a heated ozone in the presence of a reducing agent. As lead itself is easily reduced from its carbonate form, the temperature might as well be raised to the point where the lead can be liquated out, a reducing atmosphere being used instead of a sulphidizing atmosphere.

The use of a sulphureted flotation oil, in which loosely combined sulphur is available for combination with carbonates of lead or other metals, and the rest of the oil is then available for "oiling" the artificial sulphide, has given very little encouragement in the tests conducted by the Bureau:

Finally, colloidal sulphur, mentioned as a possible method of sulphidizing, does not seem to combine with lead carbonate at all. It floats as a white lining of the air bubbles in the flotation machine, and brings up very little lead with it.

Usually the precious metals contained in a lead carbonate ore accompany the lead. The writers have noticed that the silver extraction will lag behind the lead extraction when the ore is sulphidized with sodium sulphide, and that the reverse has usually been true when hydrogen sulphide was used.

The importance of sulphidizing flotation is due to the fact that there are many deposits of lead carbonate ore in all of the western states, and many of these ores have been milled with varying success. Frequently the lead carbonate can be satisfactorily concentrated by gravity methods, but often it is found that the particles of lead carbonate go into the slimes and are lost. Tailings containing 5 to 10% of lead are common. The object of this investigation is to determine whether sulphidizing flotation could not be applied to the treatment of the deposits of lead carbonate above mentioned, to prevent the waste that now takes place when these ores are treated by gravity concentration processes, and render amenable to treatment carbonate ores that are too low grade to be treated by present methods.

A flotation plant to apply sulphidizing and flotation to an ore containing lead, silver and gold is being constructed by the Prince Con. Mining Co., at Pioche, Nev., for the treatment of two tailings dumps from former pan-amalgamation and cyanide operations in that vicinity. This plant is expected to be in operation this month.

Oxidized Copper Ores.

Many attempts have been made, both by large operating companies and by other experimenters, to float the carbonate and other oxidized minerals of copper. For that reason the testing of such ores by the writers has been limited.

Hydrogen sulphide seems to be by far the best medium for sulphidizing oxidized copper ores previous to flotation. When applied to the dry ore, the writers found the same conditions as those mentioned for lead; the particles are sulphidized to the center, which requires an excessive amount of hydrogen sul-

phide. Applied to the wet pulp, the hydrogen sulphide seems to cause true filming. The writers' work has yielded black concentrates, but they are informed by Mr. Callow, of the General Engineering Co., that the company has been able to reduce the amount of sulphur used to a point where the froth is green with slightly coated malachite. He states that as little as 1/2 lb. of sulphur per ton of ore is giving good extractions in the plant of the Magma Copper Co., at Magma, Ariz., where his company has put in the first successful installation of this kind.

Sodium sulphide has been tested by a number of the larger companies who have some oxidized copper minerals in their sulphide ores. The amount of oxidized copper in such ores is usually a fraction of 1%, so that 2 or 3 lbs. of sodium sulphide per ton of ore are all that is necessary. This is usually added to the machines during flotation, or to the mixing tanks before flotation. The writers' experience is that if some little time of preliminary contact is allowed before flotation is attempted, better sulphidizing of the material will result.

Calcium polysulphide has been used for some time in a number of the large copper concentrating mills with indifferent success, and seems to be detrimental in some instances. On the ores tested by the writers fair results were obtained if the calcium polysulphide was allowed to act until the ore had become well blackened.

It is stated that sulphur vapor was tested at one of the large plants for flotation of oxidized forms of copper and gave better results than any other method of sulphidizing. Of course this method has the disadvantage of having to be applied to dried, heated and finely divided ore.

Sulphureted oils are being used at a number of plants to supplement other methods of sulphidizing and considerable secrecy is observed as to the technical details of this work.

So far as the writers know, colloidal sulphur does not assist in the flotation of oxidized forms of copper. Neither has the silicate of copper been successfully floated by sulphidizing flotation. It will blacken when sulphidized, but resists flotations. Possibly it still presents a silicate surface, rather than a sulphide surface to the flotation elements. For this reason a number of the large copper companies are seriously contemplating leaching the oxidized copper ores, rather than lose what silicate of copper may be present.

Repeated attempts to float the natural sulphides along with sulphidized minerals have failed, as the sulphidizing agents cause trouble with the flotation of the natural sulphides. By careful adjustment this difficulty has been solved in one plant, though the details are not available.

Oxidized Zinc Minerals.

Attempts to float the oxidized particles of zinc

from their ores, both before and after sulphidizing by most of the above methods, have met with no success whatever in the laboratory experiments of the writers. They are informed that some headway was made with the problem by Prof. Traphagen, at the Colorado School of Mines, but that the sulphide film seemed to come off too easily. However, poor results were obtained, whatever the cause.

The writers' experience has been that most of the carbonate ores of zinc contain important amounts of the silicate, and this may be one reason for the non-success of this work, for the same reasons that copper silicate will not float.

Direct flotation of oxidized minerals of the kind mentioned, so far as known, has not been successfully accomplished. In all of the successful work witnessed by the writers there has been some form of alteration of the oxide to the sulphide. A number of parties claim to be successful in the flotation of copper carbonates without sulphidizing, and others in the flotation of scheelite, fluorite, and magnetite. The authors were unable to verify these statements.

Results of Tests.

Some of the best results and some average results which have been obtained in the work at the Utah Station, are given in the table following.

RESULTS OF SULPHIDIZING AND FLOTATION OF OXIDIZED ORES.

 British Patent 26,019.* Nov. 10, 1909. H. L. Sulman and H. F. K. Picard.

*Provisional specifications 28,612, Sulman and Picard, applied for Dec. 7, 1909, and 29,616, applied for Dec. 17, 1909, are incorporated in British Patent 26,019.)

Methods of Mining and Milling Feldspar in the United States.

The methods of mining feldspar are very simple. The excavations are nearly all open pits, most of them of rather irregular form, the valueless portions of the pegmatite being avoided wherever possible. In quarries where the pegmatite masses are rather flat lying and are overlain by a roof or worthless rock, short tunnels have been driven from the open pits.

In the Northwestern States, according to a Survey report, the pegmatite is usually firm and undecomposed, even in the surface of outcrops, and it is necessary to sink drill holes and blast out most of the material. In Pennsylvania, Maryland, and farther south, most of the pegmatite is much decayed at the surface, and in the upper part of the deposits it can be readily excavated with picks, shovels, and crowbars.

The material used for making pottery is hand picked at the quarries to remove the more micaceous and quartzose parts and those carrying colored minerals.

The methods used for grinding feldspar for pottery and enamel ware are similar in a general way in all the Eastern States. Some spar is first burned in kilns, which serves to fracture it and thus facilitate grinding. Most feldspar, however, is fed just as it comes from the quarry into chaser mills. The material from the chasers is screened, the tailings being returned for recrushing and the fines going to the tube mills for fine grinding. For use in pottery it is so ground, as screen tests on commercial pottery spar have shown, that 99.3 to 99.8% passes through a 100-mesh screen and 96.7 to 98.2% through a 200-mesh screen. Some feldspar prepared for use in abrasive soaps is even more thoroughly ground to reduce it to extreme uniform fineness. For making glass and enameled ware, a tested sample of ground feldspar showed 94% passing through a 100-mesh screen and 74% through a 200-mesh screen. Mills for grinding feldspar for poultry grit and roofing employ jaw or rotary crushers and steel rolls; the crushed product is graded by screening.

The principal use of feldspar is in the manufacture of pottery, chinaware, porcelain, enamel ware, and enamel brick and tile. It is used in both the body and the glaze of the various grades of ceramic products. In the body it constitutes from 10 to 35%, its value there being due to the fact that it melts during firing at a temperature below the fusing points of the other ingredients and forms a firm bond between the particles of clay and quartz. In glazes the percentage of feldspar used is higher than in the body and runs from 30 to 50%. Other uses of feldspar, which do not require the high grade demanded by the pottery trade, are in the manufacture of emery and corundum wheels, where it serves as a binder; in the manufacture of opalescent glass; as a poultry grit; as a constituent of roofing material; and for surfacing concrete work. Small quantities of the purest grades of potash feldspar are used in the manufacture of artificial teeth. For this purpose it brings the highest price—\$6 to \$8 a barrel of 350 lbs. It is also used in the manufacture of scouring soaps and window wash.

The use of ground feldspar as a fertilizer has been proposed, but the results of extensive tests by the United States Department of Agriculture prove that only under special conditions is such use of value. Attempts to extract from the feldspar its content of potash are still in an experimental stage. A number of patents have been taken out on processes of extraction of potash from feldspar and other potash silicates. These are summarized in the report on potash salts. Other experiments are directed toward the treatment of feldspar or other potash silicate rock in such a manner as to make its potash content readily soluble, and then to use the treated feldspar as a fertilizer or as an ingredient of complete fertilizers. It is reported that some of the larger manufacturers of fertilizer have so used feldspar during 1915; no definite information has been obtained from them.

Anniversary Celebration of Calumet & Hecla Co.

The fiftieth anniversary of the Calumet & Hecla Mining Co. was a unique affair in the annals of mining. The feature of the celebration was a parade participated in by nearly all the employes of the company, numbering in the neighborhood of 5000, marching eight abreast, with five bands.

The speakers included Gov. Ferris of Michigan; Major Henry L. Higginson and President Aggasiz. Gold and silver medals were presented to the older employes, Timothy O'Shea being the recipient of a gold medal for having to his credit 50 years of continuous service.

The affair was in charge of Manager McNaughton.

Copper exports from Atlantic ports for the week ending July 13 were 10,485 tons; since July 1 they were 13,732 tons; a year ago, 6,288 tons.

Mining Operations at Johnson, Arizona

By W. A. SCOTT.

The property of Peabody Con. Copper Co. consists of 5 patented and 8 unpatented claims extending 2000 ft. along the strike of the ore belt. Operations on the Peabody have progressed most of the time for 20 years. The work is now under the management of W. T. Eberhardt, who is shipping about 300 tons per month to the El Paso smelter. In grade these ores vary, ranging from 4 to 6% copper, besides which are some shipments of sorted ore running from 13 to 35%. Portions of old dumps, which accumulated years ago, have been shipped; these sampled 2½ to 3% copper. Generally, the ores, besides copper, contain 5% iron, 15 to 20% lime, and 55% insolubles; they likewise carry about ½ oz. of silver to every 1% copper. The ore occurs in a contact vein between

up largely of Kentucky stockholders, their operations here being under the management of J. T. Tong. The group of 125 acres covers 3000 ft. on the ore belt, which strikes northwest-southeast. The main working, vertical shaft was sunk in the hanging wall country, 600 ft. from the vein apex. It is expected to cut the vein on its dip at about 550 ft. Sinking was stopped temporarily at 450 ft., where considerable volume of water came in. A 200-hp. boiler, a 1000-cu. ft. Sullivan air compressor, and a 75-hp. hoist are being put in position. As soon as they are ready to operate the Cameron pump on the 300-ft. level will be started, and sinking will be resumed as soon as the shaft is clear of water. The old inclined shaft, having a depth of 415 ft. on the 30° dip of the vein,

KEYSTONE COPPER MINING CO.

lime and diabase, and in several replacement veins, all within a 100-ft. belt. The gangue comprises garnetized lime and quartz. The ore is a carbonate from surface to a depth of 200 ft., although this varies some on different parts of the group. The incline shafts, by which the ore is opened to a depth of 200 ft., have penetrated the sulphides to some extent. The company contemplates putting in a heavier hoist and an 8-drill air compressor, with the view to going deeper with exploration work.

The Black Prince Copper Co. of Denver, has a steam plant and a first-motion hoist, a Sullivan air compressor, and has a 2-compartment, 900-ft. shaft, from which lateral development is being carried on. Some shipments of high-grade copper carbonate ore are being made. W. C. Bartlett is in charge of the work.

The Arizona-Michigan Development Co. is made

has shown the presence of carbonate ore down to 100 ft. depth, and sulphides below that level. With the resumption of work in the vertical shaft, a 250-ft. crosscut will be driven from its 300-ft. station to the vein, connecting with the old workings. The grades of the shipping ores, both carbonates and sulphides, run evenly, being 4½ to 5% copper, accompanied by about ½ oz. silver. The ore shipments to the Copper Queen smelter, Douglas, which for some time have amounted to a car per day, are to be doubled. Ores running less than 3½% copper will not stand shipment. As there are large bodies of 2½ to 3% ore here, the building of a concentrating mill is one of the probable undertakings in the near future.

The Johnson Copper Development Co. is opening a property, with J. T. Tong in charge. The main features of this work consist of a 250-ft. vertical shaft, and a 500-ft. drift from the 250-ft. station; and a

500-ft. winze from the level of the drift. The purpose of this is to explore for sulphide ore. The entire work discloses large bodies of low-grade carbonates near the surface and some sulphides at a depth of 400 ft. Some shipments have been made. Heavier equipment will be provided, consisting of a semi-Deisel oil engine, a hoist and air compressor.

The Keystone Copper Co., made up of Pennsylvania stockholders, has equipped and is developing a group of 16 claims lying in the southwest section of the Johnson district. The president and general manager is W. W. Miller, the superintendent in charge being U. R. Miller. The group contains several veins at contacts between lime and quartzite, all of which dip about 45° to the northeast. The development is being carried on through a 400-ft. shaft near one of the contact veins. Levels have been started from each 100-ft. station, and a considerable tonnage of ore has been blocked out between the 300 and 400 levels, of milling grade. At the 200 level a drift was run 200 ft., and a 30-ft. crosscut from this drift was all in sulphide ore, running 2 to 2½% copper. The ore body between the 200 and 400 levels, which was cut vertically and laterally, assayed 1.9 to 6% copper. May shipments sampled 3.60 ozs. silver and 17.47% copper at a Douglas smelter. It contained 21% lime, 12% iron and 25% silica. The shipments for March, April and May amounted to 16 cars. The intention is to continue sinking, to reach water level or lower, and further develop the sulphide ore bodies. Plans now being considered contemplate the building of a concentration plant, of 200 tons' capacity, to be equipped with tables and flotation machines. The cropping of iron gossan all over this group is very conspicuous.

The Cobriza Mines Development Co., a leasing concern, is operating the mine of United Mines Co., and shipping 5000 tons of ore per month to El Paso. This company also operates under lease the Johnson, Dragoon & Northern railroad, a 10-mile standard-gauge line, extending from Dragoon station, on the So. Pacific, to Johnson district. The Cobriza company is controlled by the Goodrich-Lockhart Co., New York, W. H. Galligan being superintendent of the operations at Johnson. Halsted Lindsley, New York, is consulting engineer for the company. The ore shipped samples 4 to 6% copper, and 3 to 5 ozs. silver, and is mostly a sulphide. The operations are through an incline shaft, but plans are considered for sinking a vertical shaft which would cut the ore body at 600 ft. About 4 years ago when the property was being operated by the United Mines Co. direct, a smelting plant was erected on the ground, which could not run profitably, because certain necessary fluxing ores were not available.

It will be seen, from foregoing that Johnson district has a considerable payroll, and that the ore being mined are of sufficient grade to stand shipment to smelters at Douglas and El Paso. In every mine,

however, the operations result in developing and leaving large bodies of ores of milling grade, which eventually will be concentrated. Some plans already are being made for mills, and it seems probable that Johnson will become principally a milling camp later on.

The Tungsten District.

Primos Chemical Co.'s operations in the Wolfram district, 5 miles from Johnson, Arizona, are under direction of Owen T. Smith. Tungsten ore is being mined and concentrated at the rate of 30 tons per day. The mill, which is equipped with jigs and tables, turns out a concentrate that runs 60% tungsten, and which is sacked and shipped to Clifton, Pa. The ore consists of both tungsten placer gravel and white quartz. The former is scraped up from a gravel wash deposit in the little valleys, and the latter is mined in the low hills.

J. R. Hubbard and associates are mining and milling in a similar manner in the same district. They have 300 acres in that locality, comprising low granite hills containing narrow veins of tungsten-bearing white quartz and intervening gravel wash beds containing tungsten. The mill is being operated mostly on the placer material. The overburden is removed by scrapers, and the placer material, containing hubnerite, is then hauled to the mill. These nuggets average 67% tungstic acid. At the mill the material is washed down through coarse and fine revolving screens, the coarse being concentrated by Hartz jigs, the middling by Richards pulsator jigs, and the fines to Wilfley tables. About 50 tons per day are handled in this way. The jig concentrates are said to run 74% tungsten; and the table product about 57%. Some scheelite ore is obtained in the quartz veins. H. W. Larson has leased an area of the decomposed wash from the surrounding hills, and is arranging to place a movable dredge, on wheels, on the property to take up the tungsten placers to bedrock in placers where it is 15 to 18 ft. in depth.

P. M. Sebring, in this locality, sold bench land and granite hills, containing tungsten placers and quartz to the Draper Co. of Chicago, and this company has built a plant for concentrating the placer dirt and ore.

Foreign Visible Copper Supply.

Copper visible supply in England, France and afloat thereto decreased 1014 tons from July 1 to July 15, being 14,362 tons on latter date. Recent figures of visible supply compare:

Production of Graphite in 1915.

As usual, the greater part of the crystalline graphite produced in the United States in 1915 came from New York, Pennsylvania, and Alabama. The production of these states, according to a Survey report, was all of the variety known in the trade as "flake" graphite, which occurs as small flakes forming 5 to 10%, by weight, of crystalline schists, from which it is separated by more or less complicated milling processes. In addition, a small quantity of crystalline graphite, resembling in a general way the Ceylon graphite, was produced in Montana. As a result of increased production in all the states, but particularly in Alabama, the quantity of crystalline graphite produced in 1915 exceeded that for any previous year. The number of producers of crystalline graphite were four in Alabama, one in Montana, three in New York, and two in Pennsylvania.

Amorphous graphite mined in this country is used locally for foundry facings and paint pigments. Its production was not stimulated by the war and was considerably below that for 1914. There were three producers, located in Nevada, Rhode Island, and Wisconsin.

The imports of graphite into the United States in 1915 exceeded in value, though not in quantity, those for any previous year. The increase in value was due to the prevailing high prices and to the small quantity of low-grade graphite imported.

The imports credited to England and France in the table probably represent, respectively, Ceylon and Madagascar graphite. No graphite mined in England or France is known to have come into this country in 1915, but the embargoes placed, late in 1914, on Ceylon and Madagascar graphites prohibited their shipment to any but British and French ports. From these ports some of the graphite was reshipped to the United States.

Graphite in large quantities is manufactured by the Acheson Graphite Co., at Niagara Falls, N. Y., which utilizes electric power generated at the Falls. In 1915 a large new building was erected exclusively for the manufacture of "Gredag," a mixture of grease and graphite used for lubrication. In March, 1916, a new furnace house was in process of erection. When this is completed the company will have four furnace houses in Niagara Falls, N. Y., and one in Niagara Falls, Canada, accommodating in all about 40 furnaces.

The demand for graphite electrodes greatly increased during the year on account of the remarkable growth in certain electrochemical industries. The extent of this growth is indicated by the statement that during 1915 the number of electric steel furnaces in operation in this country increased 78%. It is interesting to note that the graphite electrodes made at Niagara Falls range in size from a diameter of one-sixteenth of an inch to a diameter of 12 ins. and a length of 77 ins.

The bulk graphite produced by this company in 1915 was reported as 2542 short tons, valued at \$99,633. This represents only the graphite which would come into competition with natural graphite and does not include certain graphitized products that do not compete with natural graphite. This material, most of which is made either from anthracite or from petroleum coke, comes from the furnace in an earthy, incoherent condition, and is utilized mainly in lubricants and paints, and for foundry facings, boiler-scale preventives, and battery fillers.

Portable Electric Lamp Outfit.

The Hirsh portable electric lamp outfits are well known throughout the country. This concern has lately brought out a light with high candle power, especially suitable for shaft sinking and mine work in general. They are made in two sizes: 6 volts, having three cells, large reflector, 20 to 25 candle power, weighing 10 lbs. complete. The 10-volt outfit

HIRSH PORTABLE ELECTRIC LAMP.

weighs 26 lbs., has five large cells with large brilliant reflector and powerful nitrogen lamp, giving 35 to 40 candle power.

These outfits can be carried as hand lamps or with long detachable cords, and will throw a strong light, 200 ft. or more. The batteries are easily and quickly recharged, maintaining a low cost.

The war's effect on Argentina's consumption of iron is demonstrated by that country's imports of pig iron and steel for 1915 of only 203,805 metric tons. This is more than 50% less than the imports in 1914—433,924 tons—and only one-third of those in 1913, which were 680,709 tons. Argentina imported only 2708 tons of pig iron and sheet iron last year, against 92,628 tons in 1914 and 186,576 tons in 1913. Steel-rail imports fell from 156,592 tons and 84,936 tons, in 1913 and 1914 respectively to 13,391 tons in 1915.

The total value of the abrasive materials consumed in the United States in 1915 was \$4,451,616. Imports totaled 540,783.

Motor Truck Operation at Mammoth Collins Mine, Shultz, Arizona

By WILBERT G. McBRIDE.*

Two Alco 3½-ton motor trucks were used by Young Bros. while operating at the Mammoth Collins mine at Shultz, Ariz. One was equipped with an oil tank holding 1075 gals. and was used for the transportation of "tops." The other was fitted with a stake body and used to carry machinery, wood, rails, pipe and all classes of miscellaneous supplies. The bodies were made of oak with maple flooring and were attached to the frame of the chassis by U-bolts, to avoid drilling the main members of the frame.

Most of the hauling was done from Tucson, a distance of 47½ miles. During the first 3 months part of the road was in very bad condition and the tire cost was excessive. After this part was repaired the road was in fair condition, but never good. There were no excessive grades or bad sand, but wagon ruts, too narrow for the truck wheels and of a different gage, caused heavy tire loss; while chuck holes, sharp curves and stones, both imbedded and loose, were objectionable features. During wet weather the trucks could not get sufficient traction to climb some of the hills and were likely to stick in the mud in certain places, so that no attempt was made to run them unless they were on the road when the rain started. This lost time amounted to about 5% of the total, but whenever possible it was utilized in making minor repairs.

The price of gasoline was from 17 to 21 cts. per gallon. Rubber tires were used throughout. Drivers were paid \$4.50 to \$5 per shift, and a return trip to Tucson was counted as two shifts, even when made in one day. Drivers were provided with a room in Tucson and were paid for all time lost due to causes beyond their control. Trucks were loaded one way only.

Speedometers were placed on both trucks, but the excessive vibration soon caused them to fail. For this reason, and because no account was taken of the distance covered in picking up a miscellaneous load or in other minor ways, the mileage given is under the actual distance traveled. Some of the weights had to be estimated, but care was taken to have the number of ton-miles low rather than high, to avoid underestimating the costs. The cost of hauling from Tucson to the mines was \$12 per ton with the trucks, while the best possible team price was \$15. Teams made one return trip a week, while the truck regularly made one in 2 days and could always, and many times did, do it in one day. The loss of time due to wet weather would be about half as much with teams as with trucks.

The table of detailed costs given below covered the period from Aug. 21, 1913, to Aug. 15, 1914, the only

time in which the trucks were continuously employed. From Aug. 15, 1914, to March 30, 1916, the trucks were used intermittently, but the figures for this period have been excluded as not being representative. If included, they would somewhat lower the cost per ton-mile. Just prior to the close of the period covered by the cost figures the trucks were overhauled and put in good condition; new rear wheels were put on and new tires secured. The cost of all this was charged to operation. Allowance for extra tires on hand would reduce the cost per ton-mile approximately ¾ ct., leaving a net cost of about 25 cts. With loads on the return trip this cost per ton-mile would be lowered at least 40%.

The advantages of the motor truck over the team and wagon are many—increased speed, ability to work 24 hours per day when necessary, and lower cost on long hauls—but its adoption by the mining industry has been slow. Where trucks are used around mines they are usually driven by cheap, inexperienced men, the upkeep and repairs being turned over to the regular mine mechanics. It would be equally good practice to employ a timber framer to make a dining room table. If there are enough motor vehicles at the mine, the master mechanic probably turns the work over to one or two men, who in time become indifferent auto-mechanics, but in the meantime the cost of maintenance soars and often the trucks are condemned. The aim of the makers of all motor vehicles is to secure the maximum of strength and power with a minimum of weight and size. To do this, high-speed engines, the best of materials and the finest of workmanship are employed and parts are reduced to the least possible weight consistent with strength and durability. This is just the reverse of the ordinary American mechanical practice in which reliability is secured by slow speed and large size, the amount of material used and

*Consulting Engineer; Proc. A. I. M. E.

the space occupied being minor considerations. It is therefore unreasonable to expect the mechanic trained in one school to understand immediately and adapt himself to the ways of the other. It must also be remembered that no other machine is given the hard use and necessary abuse that a motor truck receives. The road vibration alone will loosen nuts and rivets which, if not attended to in time, will cause serious trouble. Where only one or two trucks are used, the drivers should be competent mechanics and should be held responsible for the maintenance of their machines. Where several are used, they should be under the direct supervision of a thorough truck mechanic who is held responsible for operation and given entire control of the drivers and repair work. His constant care will detect and remedy many incipient defects and prevent expensive and annoying breakdowns. With the exception of the time required for periodic overhauling, he should be able to keep the trucks in almost continuous service. This will make possible the employment of cheaper drivers without undue damage being done to the machines.

Motor trucks should not be installed without careful consideration of the roads to be traveled. The difference between the cost of motor truck and team hauling is largely controlled by the quality of the road, and on really bad roads the motor truck is decidedly the more expensive. Many roads are fatal to truck haulage, and considerable experience is required to decide this question without an actual test of some duration. Excessive grades are to be avoided, especially long ones. The ordinary truck will pull over a 20% grade with ease, but will give great trouble on a long one of half that rise unless special cooling arrangements are made. Grades greatly increase the tire and gasoline consumption and decrease the life of the machine. Rocky roads, particularly when the rocks are sharp or loose, are very hard on tires. Deep sand is difficult to cross, and for this class of road the caterpillar tractor and the 4-wheel-drive truck have distinct advantages. Trucks which drive on the rear wheels only cannot operate in heavy sand. Narrow or rutted roads are objectionable for the larger-sized trucks because they throw all the weight on one of the rear dual tires from time to time, and this overloading is injurious to the rubber. Fairly deep streams can be crossed, but mud is an absolute barrier except to the caterpillar type of tractor. Few dirt roads will stand up under a 7-ton truck, but those of 4 tons or under do less damage than the ordinary freight wagon.

Unfortunately, most trucks are not designed to suit mining conditions. At the Shultz we found it necessary to cut down the gear ratio, increase the size of the wheels and tires and add bumper or auxiliary springs. Had the grades been steeper it would have been necessary to increase the cooling capacity.

For long hauls the motor tractor will probably replace the motor truck. It will operate at a lower cost because the load will be carried on iron tires, and, as the table of detailed costs shows, the rubber tires ac-

count for 22.3% of the total. Tractors travel more slowly than motor trucks, but the tonnage hauled in a trip is much greater. They are also easier on roads, as the load is distributed over several trailers. By using extra trailers, loading and unloading can be done while the tractor is on the road.

The make of a truck is not as important as the care it receives. Almost any standard make will do good work if given careful attention, but none will be satisfactory if not well cared for. Economy should not be sought in the lubricants used; the best oil is none too good for a motor truck. Overloading should be scrupulously avoided. A truck may be made to carry many times its rated load without breaking down, but the damage is none the less real because not immediately apparent. High speed, particularly if the road is rough, should be avoided, since it subjects the machine to excessive strains and vibration. Most trucks are now equipped with speed governors, but these are easily tampered with and must be carefully watched. When they are not used the drivers should be carefully instructed as to the speed limits and compelled to respect them.

Distillate and "tops" are now successfully used on trucks, by the application of a special carburetor. Their use should effect a material saving in the gasoline cost, which now amounts to almost 15% of the total. "Tops" usually sell for 30 to 35% and distillate for 50 to 60% of the price of gasoline. With a properly designed carburetor, the available power in the lower-grade fuel will be about the same as in the gasoline, but the carbon deposition will probably be somewhat greater.

To Erect New Zinc Plant.

The United States Smelting & Refining Co. will spend \$350,000 for an electrolytic zinc plant at the subsidiary Mammoth Copper Co. works at Kennett, Cal. The site of the new zinc plant is 1 mile above the copper smelter. The purpose of the new plant will be at first to recover zinc and refined copper and other metals from the flue dust of the copper smelter. There are 65,000 tons of accumulated flue dust. Subsequently it is intended to treat here the zinc ores now shipped to Kansas. It is not generally known that the Mammoth properties contain important ore bodies as well as copper. About 3,500 tons of zinc ore are run over picking belts monthly and 700 to 800 tons of hand-picked product, running 40 to 41% zinc have been shipped to the company's Kansas smelters each month for a year past. The United States Smelting & Refining Co. has recently purchased the Stowell group of copper claims for \$90,000.

Chilean exports of bar copper in 1915 were 45,022 tons, against 25,795 tons of bar copper and 15,987 tons of copper ingots in 1914. In January, 1915, the price was \$287 per ton; in June, \$410.60 per ton, and in December, \$418.5 per ton.

Efficiency in Electrolytic Extraction

In the electrolytic sulphate process for the extraction of copper, three serious conditions have to be met: the insoluble anode; electrode inefficiency, and fouling of the electrolyte. Not the least of these is the fouling, which causes short-circuiting deposits, increases the resistance of the electrolyte and other evils.

William E. Greenwalt of Denver, Colo., has patented a process of extraction of metals (No. 1,179,522) which is said to overcome these objections to a considerable degree.

Without going into all the fundamental chemistry involved in the sulphate process, a brief description of the working of the new apparatus will indicate to those familiar with this branch of the art the features which tend toward greater efficiency.

Referring to the illustration, in the leaching vat or agitator the ore is treated, say, with a sulphuric acid solution for the extraction of the copper. After the copper has been dissolved, the copper sulphate solution is filtered into storage tank 2. The residue is then washed, and the wash water filtered into storage tank 3. Tank 2 now contains the rich copper sulphate solution, preferably neutralized or nearly so by the ore, and tank 3 contains the resulting wash water charged more or less with cupric sulphate.

In scrubbing tower 4 is applied sulphur dioxide or other reagent to the copper sulphate solution, and 5 is a scrubbing tower for the application of sulphur dioxide or other reagent to the wash water.

The electrolyzer consists essentially of a cathode tank 31 containing the catholyte and the cathode 12. An anode bell 9 suspended within the cathode tank has a diaphragm covering the lower portion and containing the anolyte and the anodes. The anode bell may be adjusted vertically and oscillated.

The anolyte is exhausted from the electrolyzer through the duct 10, and the catholyte through the duct 19.

A sulphur dioxide generator 23 communicates with the scrubbing towers. The gas is exhausted from the generator and forced into the towers.

The bottom of the tower 4 communicates with the cathode compartment of the electrolyzer, while the bottom of tower 5 communicates with the anode compartment, through trap pipes. The cupric sulphate solution coming in contact with the sulphur dioxide, all salts are reduced to their lowest valencies with the simultaneous regeneration of a certain amount of free acid, and the solution charged with the gas. It then flows into the cathode compartment of the electrolyzer. Similarly the wash water, after being charged with sulphur dioxide, flows into the anode compartment of the electrolyzer. The current is then turned on and the anode bell started to oscil-

late. Copper is deposited on the cathode and sulphuric acid regenerated at the anode, while at the same time a certain amount of oxygen is released, most of which escapes, but a very small amount peroxidizes the lead anodes. This peroxid, due to the oscillation of the anode bell, is detached about as rapidly as formed and expelled from the electrolyzer with the anode solution, through the pipe or duct 10 into the tank 16, where the suspended peroxid is allowed to settle out of the anode solution. The clear regenerated anode solution, now freed from the peroxid, is pumped back to the leaching vat, where it acts on the copper in the ore.

The cathode solution is gradually deprived of its

GREENWALT SYSTEM ELECTROLYTIC EXTRACTION.

copper, and owing to the oscillating anode bell and diaphragm, it may be closely extracted, and deposited in a regular condition to any thickness desired. If the cathode solution is quite impure, a dense diaphragm is used in connection with a low current density. In this way practically all the copper in the catholyte may be deposited on the cathode and all the combined acid transferred to the anode. The catholyte, when impure, may be wasted without tangible loss, either of metal or acid.

If, however, the catholyte is not sufficiently impure to in any way interfere with the operation of the process, a dense diaphragm is not necessary, and

if a small amount of diffusion occurs it will do no harm.

Under these conditions it will not be necessary to attempt close extraction of the copper from the catholyte, and when it is reduced to about 1%, for example, it is flowed into tank 20 from whence it may be pumped back to the ore, or before pumping it back to the ore, it may first be passed through the anode compartment of the electrolyzer to be augmented in acid. In any case, after being again applied to the ore, it may be used as the catholyte, if rich in copper, or the anolyte, if it is desired to increase its copper content before electrolyzing to deposit the copper.

The sulphur dioxide in the catholyte serves two purposes: it reduces the harmful ferric salt to the harmless ferrous salt, and should any ferric salt diffuse through the diaphragm it would be immediately reduced to the ferrous condition. The oscillating bell and diaphragm greatly helps this reaction.

After enough peroxide of lead has accumulated in tank 16 to warrant its reduction, it is taken out, washed, dried, mixed with carbon, and again reduced to metallic lead, and again cast into anodes to pass through another cycle. In this way a certain amount of anode lead may last indefinitely, and pass through an indefinite number of cycles.

It is evident that the impurities in the solution may be limited to the amounts found to do no appreciable harm, and this limit is best ascertained by direct experiment.

Combined Sintering and Smelting Apparatus.

In several patents (1,169,069-139-384, Jan. 18 and 25, 1916) granted to Arthur S. Dwight of New York city, apparatus is shown for the combined and continuous treatment of ore by first sintering into a rigid cake and then smelting in a reverberatory furnace. The sintering apparatus is of the type commonly known as the Dwight-Lloyd, consisting of a series of grate-bottomed pallets receiving a charge of ore to be sintered, and successively carrying the charge under an igniting mechanism and over a chamber from which air is being exhausted, with the result that the sulphurous material burns and causes the entire mass to agglomerate into a porous, rigid cake. In the present invention this cake is continuously discharged into a smelting furnace, whereby the heat of the sinter is economized in the smelting operation. The smelting furnace is of the reverberatory type, with fuel-oil or other burners so disposed that their flame will impinge on the entering sinter and fluxes and cause them to separate into matte or metal and slag in the usual manner.

The United States produced 20,555 short tons of soapstone in 1915 valued at \$490,385. Nearly all of this came from Virginia.

Chromium as a Self-Hardening Factor in Steel.

Discussing chromium steel before the annual meeting of the Iron and Steel Institute in London, England, May 4, 1916, in a paper, "Initial Temperature and Critical Cooling Velocities of a Chromium Steel," Prof. C. A. Edwards (Manchester University), J. N. Greenwood and H. Kikkawa stated that it is well known that the element chromium is widely used in the metallurgy of the so-called special steels. In most instances, however, another specially added element is also present, and this fact often makes it difficult to determine the exact function of the chromium and its influence on the physical properties of the steel when subjected to varying heat treatment. Although chromium is more commonly used with tungsten, nickel or manganese, etc., there can be no doubt that it plays a very important role. The object of the paper, the authors say, is to draw attention to a long series of experiments which clearly illustrate how remarkably sensitive our particular chromium steel is to what are really very slight variations of treatment. The steel used in the experiments had the following composition:

	Per cent.
Carbon	0.63
Silicon	0.07
Manganese	0.17
Chromium	6.15

The authors offer the following conclusions derived from their experiments:

1. The evidence contained in the present paper confirms the contention that chromium imparts the property of self-hardening to steel.
2. This property of self-hardening is governed by the rate of cooling.
3. The critical cooling velocities which produce hardening vary with the initial temperature, being much slower as the temperature is raised. The extent of this variation has been determined for a wide range of temperature.
4. The appearance of self-hardening coincides with the presence of large quantities of martensite and a diminution in the magnitude of the carbide thermal change.
5. The maximum hardness was obtained when the thermal transformation had been entirely prevented, and when this was accomplished the steel was purely martensitic in structure.
6. While, with the chromium steel which has been used, the cooling rates which produce hardening are extremely slow as compared with those which are obtained in the hardening of carbon steels by quenching, the two operations are fundamentally the same. In other words, a given rate of cooling which might be regarded as slow for carbon steels really constitutes quenching in the case of some special alloy steels.

June copper exports from Atlantic ports totaled 38,373 tons, against 16,976 a year ago.

Herman Screening Tube Mill.

The Herman screening tube mill is illustrated herewith. It was invented and patented by John Herman, Los Angeles, who has arranged with the Braun Corporation, that city, for its manufacture and sale. The mill is made in several sizes, the one shown herein being a 3-ft. diameter and a length of 1 ft. Others are built having the same diameter and a length of 2½ ft. The periphery is made up of slotted bars, through which the discharge is made. The entire slotted outside surface is covered by a screen of any mesh desired. In the pulverizing process either pebbles or iron balls are used. The main feature of

HERMAN SCREENING TUBE MILL.

the mill is in screening out the fine material as fast as it is reduced to the proper mesh. The slots are so shaped that any material which has not passed through the screen falls back to be recrushed. The bars can be used until almost worn out, and a set can be replaced in a 20-ton mill at a cost of \$40. The bars are estimated to last 6 months with the use of pebbles and 2 months with the use of iron balls. The screens fit tightly against the mill exterior, being firmly held by iron bands. Granular material can be screened as fine as 80 mesh, and other material from 40 to 80 mesh, according to its nature. The mill of 3-ft. diameter and 1-ft. longitudinal section requires 1½ hp., and has a capacity of 8 tons per 24 hours, using a 40-mesh screen; or 16 tons capacity with a 10-mesh screen. A mill of 3-ft. diameter and 2½ ft. long requires 4 hp. and has a capacity of 20 tons with a 40-mesh screen, and 40 tons if a 10-mesh screen is used.

Dome Lake Cyanide Mill Making Close Saving.

The cyanide annex at the Dome Lake mine, South Porcupine, Ontario, is just now attracting general attention from metallurgists, and will likely completely revolutionize the scientific treatment of ores throughout the Porcupine camp. Engineers who have examined this system of filtration in connection with the Koering drums so express themselves, and too much credit cannot be given Managing Director Sher-

rill for his untiring efforts in the best interests of the Dome Lake, as well as for his courage in being the first to "try out" the newly discovered treatment which at this particular time meant so much to the ultimate success of this company.

During 1915 milling operations at Dome Lake averaged below 40 tons per day, with a gold extraction below 80%, and ore values running low. In spite of these factors mine operations at the end of 1915 showed a profit. The milling plant is now handling 80 tons per day, with gold extraction averaging better than 95% and ore values per ton at least \$3 higher.

Assays taken from the tails last week showed values of only 40 cts. to the ton remaining. This is identical with the Hollinger tailings values lost and speaks well for the efficiency of the new cyanide plant. This is quite a contrast to the conditions previously obtaining, before the construction of the new cyanide plant, when during 1915 in the 11,727 tons of ore treated, \$21,454.36 was lost in the tailings, equal to a loss of \$1.83 per ton, a saving of \$1.43 per ton. The assays taken are not considered entirely conclusive but were made from tailings taken promiscuously from the dump and should be an approximate average.

Alunite in British Columbia.

Deposits of alunite have recently been discovered on Vancouver Island in British Columbia, according to Commerce Reports. The analysis of the alunite-bearing rock shows a lower potash content than the high-grade deposits in Utah. Following are analyses of three samples taken from different places in the deposit:

Vancouver Alunite.	No. 1.	No. 2.	No. 3.
Silica	52.00	55.65	44.40
Alumina	19.95	16.30	21.80
Sulphuric acid	16.00	15.30	21.40
Oxide of iron	2.05	2.15	.70
Potash	5.60	4.30	4.50
Water, etc.	4.40	6.50	7.20
Total	100.00	100.00	100.00

The results of the above analyses might be compared with three typical analyses of the alunite from Marysville, Utah:

Utah, Alunite.	18.	19.	Dana.
Alumina (Al ₂ O ₃)	37.18	34.40	37.0
Ferrie oxide (Fe ₂ O ₃)	Trace	Trace
Sulphuric trioxide (SO ₂)	38.34	36.54	38.6
Phosphorus pentoxide (P ₂ O ₅)58	.50
Potassium oxide (K ₂ O)	10.46	9.71	11.4
Sodium oxide (Na ₂ O)33	.56
Water (H ₂ O plus)	12.90	13.08	13.0
Water (H ₂ O minus)09	.11
Silica (SiO ₂)22	5.28
	100.10	100.18	100.00

There is a possibility that more extended investigations of these deposits may bring to light a higher grade of rock. This possibly is shown by the fact that a small sunken island some little distance from the mainland contains rock of a much higher potash content than any of the samples above enumerated from Vancouver, all of which were collected at a short distance from the coast and on the hillsides.

Raw alunite has already been largely used directly as a fertilizer with manifest advantage. The roasted

mineral, however, gave double the yield in increasing the crops when experimental comparisons were carried out on similar tracts of land.

The Tungsten-Molybdenum System.

The tungsten molybdenum system is discussed by Dr. Frank A. Fahrenwald of Cleveland, Ohio, in a paper to be presented at the Arizona meeting of the American Institute of Mining Engineers in September. The results of an investigation of alloys of these two elements, in which methods were employed that avoided the usual difficulties accompanying high-temperature alloy investigations, are summarized as follows:

1. By compressing the mixed reduced powders of tungsten and molybdenum into briquets and then heating with an electric current in an atmosphere of hydrogen, alloys of this series were prepared varying in composition from 100 per cent tungsten to 100 per cent molybdenum.

2. The solidus curve for the series was located by means of optical pyrometer temperature measurements and checked by comparing the fusing current with a standardized wattage-temperature curve.

3. The equilibrium diagram for this series shows no critical points, appearing as resistance fluctuations, corresponding to a separation of a new phase. Its construction has been based upon this fact and upon results of microscopical analysis.

4. Curves for hardness and for equiaxing temperatures are smoothly convex, being typical of an uninterrupted series of solid solutions (mixed crystals).

5. As a result of thermal and microscopical analysis, the metals tungsten and molybdenum are reported to be completely isomorphous.

6. All alloys of this series are malleable and ductile under proper conditions.

New Russian Manganese Ore District.

A new Russian district producing manganese ore is attracting attention, according to M. Stromberg of Moscow, Russia, editor of the Journal of the Russian-American Chamber of Commerce. It is the Gaisinsk district, in the province of Podolia, near Hosheratovo. The natural supply, a pyrolusite, is apparently large, and its distance from Odessa by rail is 221 miles. Up to the present mining has been on a small scale, not exceeding 450 tons, which has gone to southern metallurgical works.

The principal district of Russia producing manganese ore, the Caucasus, yielded in the decade from 1904 to 1913 an average of 600,378 tons per year, or about 75% of the yearly Russian output. The Nikopol district, second in importance, averaged 195,010 tons per year, or 24% of the total. The other districts, the Ural and western Siberia, averaged only 21,487 and 152 tons, respectively, in 1912. Russia ranks first in

manganese ore production, supplying 37% of the world's total output in the decade from 1903 to 1912, against 20% from British India and 12% from Brazil. In the decade from 1904 to 1913 the annual exports of manganese ore from the Caucasus averaged 680,730 tons, of which 640,825 tons (93.97%) was exported and 39,900 tons supplied to southern Russia.

Advantages of Stronger Detonators.

The Bureau of Mines recommends the use of nothing weaker than No. 6 detonators (blasting caps and electric caps), which recommendation together with reports from the various powder companies regarding unsatisfactory results obtained by users of explosives when detonators weaker than No. 6 are used, led the Institute of Manufacturers of Explosives (which is composed of practically all the powder manufacturers) to ask manufacturers of detonators to make nothing weaker than No. 6. Practically all high explosives manufactured today are of the relatively less sensitive type (and consequently safer), but as it is therefore necessary to use a powerful detonator (not weaker than No. 6) to ensure complete detonation, it should be self-evident that weak detonators reduce the blasting efficiency of the explosives and increase blasting costs. The United States government recommends stronger detonators; the Institute of Manufacturers of Explosives recommends stronger detonators; the powder manufacturers recommend stronger detonators. Think this over.

Kollberg-Kraut Flotation Machine.

U. S. patent (1,170,665) has been issued to F. B. Kollberg and M. Kraut of Bisbee, Ariz., covering a flotation machine comprising a long rectangular agitating chamber, in which a drum, provided with a series of longitudinal riffles on its face, rotates at a suitable speed. The ore and water are fed into the agitating chamber at such a rate as to keep the drum only slightly submerged in the pulp. Oil is added through oil supply pipes. The revolving drum picks up a thin layer of pulp, which is thrown off tangentially by centrifugal force in the form of fine spray, thus receiving excellent aeration, and is discharged through a suitable opening into a separating chamber or spitzkasten, where the froth is separated from the gangue. Additional aeration of the pulp is secured from air that enters the interior of the drum and is forced into the pulp through perforations in the face of the drum.

Many mines lose thousands of dollars in wasting time and power, as well as much valuable tonnage, by being too niggardly in the matter of level bosses or under-foremen. While the conditions of many big mines must be studied individually, it is a self-evident fact that sub-foremen will save time, power, materials and over-head expense, and increase the tonnage.

What the Mining Companies are Doing

Goldfield Con., Nevada.

During April the total production of the company was 30,400 tons, from which resulted net realization of \$60,041.42. Operating costs were as follows:

Mining.	Per ton ore handled.	Per ton total ore.
Stoping	\$ 2.50
Development	13.77
Total mining	\$ 2.90	\$2.77
Shipping expense
Leasing expense
Dumping moving38
Transportation06	.06
Milling	1.71	1.71
Marketing03	.03
General expense39	.39
Bullion tax04	.04
Filter royalty05	.05
Surface04	.04
Total operating costs.....	\$5.11
Miscellaneous:		
Earnings	\$1.01
Net operating costs.....	\$4.10
Construction	\$0.84	.84
Net costs	\$4.94

Granby Con., B. C.

Estimates of the earnings of the Granby Con. Mining, Smelting & Power Co., with mines in Alaska and different parts of British Columbia, together with smelters at Anyox and Grand Forks, B. C., based on preliminary figures, fix the profits of the corporation for the fiscal year ended June 30, 1916, at approximately \$5,500,000, or \$36.67 a share on the outstanding capitalization of 149,985 shares at \$100 each. The net profits in May were in excess of \$800,000, and for the 11 months ended May 31 they are estimated at \$4,500,000.

Granby's operations in the last year have shown results far exceeding the hopes entertained for the property by its most optimistic friends. The new smelter at Anyox has given, and continues to give, an excellent account of itself, and the plant is now on an operating basis where economies planned for it demonstrate their worth.

Development work has been carried on at the Hidden Creek mine and it is understood new tonnage will have been added to ore reserves by the time the next annual report appears. At the Midas mine in Alaska much development also has been accomplished, and shipments of ore from that property to Anyox will constitute a factor in Granby's production this summer.

From present indications Granby closed its fiscal year with a production close to 63,000,000 lbs. of copper. The May output, totaling 4,727,929 lbs., was the largest ever turned out by the company. Of this amount 3,383,230 lbs. were contributed by the Hidden Creek smelter, while the Grand Forks plant turned out 1,344,699 lbs. Actual production in the 11 months up to May 31 was 53,717,551 lbs. Granby's earnings, based on copper delivered at the highest prices, were at one time at the rate of \$50 per share.

Alaska Gold Mines.

The June report of the company shows 161,800 tons of ore milled, of an assay value of \$1.06 a ton, against an assay value of \$1.40 in May. The per cent of extraction is given as 79.25, as compared with an extraction of 82.85% in May; the loss in tailings per ton was 22 cts., compared with 24 cts. in May.

In explaining the June report General Manager Thane has the following to say:

"In connection with the monthly return herewith I would say that starting the early part of the month with low heads we had a continual improvement in them up to the end of the month, but the average grade for all of June is low because none of the better grade of ore which came from the 5th, 6th and 7th levels east of the shaft actually got into the mill until the 17th of the month, due to the fact that the bins

were filled with ore of the lower heads from the preceding month.

"As I wired in May, the indications were that No. 2 stope east of the fifth would be finished early in June so that we could draw a heavy tonnage from the same; but as the mining continued in the back of the stope the east body continued to open out and there is at least 100,000 more tons now in sight of high-grade in these stopes than we originally expected to get. During the month of May this stope had to be kept full in order to reach back to the drills, and mining has had to be conducted during June very slowly and carefully in this section of the mine.

"We are unable to draw as large a tonnage yet as we would like from this section.

"While the conditions of the new stopes on the sixth and seventh east are improving steadily, they were not in shape during the month of June to deliver any tonnage to offset the amount we were unable to draw as above described from the fifth level. During the month of July we should draw a larger tonnage from the sixth level and a fair amount of tonnage from the fifth level east and anticipate an average heading.

"Last Monday we milled 8700 tons in 24 hours, which is our second largest run so far."

Nipissing Mines Co., Ontario.

During the first half of this year Nipissing shipped slightly more than 3,000,000 ozs. of silver. This included, however, the metal secured in treating high-grade custom material. The company's own yield for the full year is expected to run close to the 1915 output of 4,000,000 ozs.

Operations up to end of May show as follows:

	Gross production.	Net.	Shipments.
January	\$169,800	\$103,600	\$147,000
February	171,800	104,600	309,000
March	170,000	105,500	322,100
April	167,400	101,800	447,500
May	291,900	218,800	420,900
June	*200,000

*Estimated.

The production figures indicate the company's own mining operations while shipments include custom products as well.

Two dividends of \$300,000 each, totaling \$600,000, were paid during the first 6 months, while another of like amount will be paid shortly from the half year's profits. Including the July disbursement there will have been paid out in dividends by the Nipissing Co. in its ten years' life a total of \$14,340,000.

Anaconda-Inspiration Absorption.

It is generally believed that plans are under way for the absorption of the Inspiration Con. Copper Co. by the Anaconda Co. The basis of exchange will probably be one and one-half shares of Inspiration for one of Anaconda. Anaconda Copper Co. already owns approximately 150,000 shares of Inspiration valued on basis of present market prices at about \$8,000,000. It has been known for some time past that interests closely identified with Anaconda group of properties have been buyers of Inspiration shares. It is believed buying of Inspiration has been more on account of its eventual absorption by Anaconda than the \$2 quarterly dividend.

Designed and constructed to handle 800 tons of ore daily, each of the 18 sections of the Inspiration mill has been putting through 900 tons per day. This has had the effect of raising the total tonnage treated from 14,000 to 16,000 tons daily.

It was the official belief early in the year that Inspiration would show an average production of 10,000,000 lbs. of copper monthly. A yield of 11,000,000 lbs. per month does not now appear improbable when all conditions are favorable.

Preliminary estimates place the June output at 10,500,000

lbs. of copper. The average cost during the first half of the current year was about 8½ cts. For the final 6 months of 1916 the cost will be somewhat increased by higher wages, although the increase will be offset to a great extent should the expected higher production materialize.

Champion Copper Co., Michigan.

The Champion Copper Co., incorporated under the laws of Michigan, has filed with the Massachusetts secretary of state a statement of its financial condition, dated March 31, 1916, as follows:

Assets—	1916.	1915.
Real estate	\$1,035,500	\$1,035,500
Stock of Michigan Smelting Co.	110,000	110,000
Copper and supplies	1,534,972	1,811,729
Cash and debts receivable	1,029,374	88,084
Construction	2,903,818	2,903,818
Total	\$6,613,665	\$5,949,131
Liabilities—		
Capital stock	\$2,500,000	\$2,500,000
Accounts payable	100,763	95,201
Surplus	4,012,902	3,353,930
Total	\$6,613,665	\$5,949,131

Inspiration Con. Co.

Inspiration Con. Co.'s operating profits for the first half of 1916 will approximate \$8,750,000. Assuming all bonds converted, these earnings would have been equivalent to \$7.30 a share, on 1,182,755 shares. There was disbursed to stockholders one dividend of \$1.25 in the half year, while from the 6 months' profits a second dividend of \$2 a share will be paid on July 31.

Practically all of the Inspiration bonds have been converted, there being outstanding now but \$32,700. Interest on the debentures, which were called in at 105, has ceased as of July 1, while interest on the first mortgage bonds will cease on Sept. 1. The process of converting the bonds into stock has worked out as follows:

	Total issues.	Converted.	Out-standing.
First mortgage	\$ 6,000,000	\$ 5,973,500	\$26,500
Debentures	4,500,000	4,493,800	6,200
Total	\$10,500,000	\$10,467,300	\$32,700

It is understood that Inspiration received an average price of about 25 cts. a pound for its copper during the 6 months ended June 30. This was produced at a cost of close to 8½ cts. a pound, leaving a margin of profit of 16½ cts. a pound. The half year's production approximated 53,000,000 lbs. of copper, estimating the June yield at 10,000,000 lbs.

Inspiration has just completed its first full 12 months of production. On June 29, 1915, the first unit of the mill went into operation. The company produced in the year 73,000,000 lbs. of copper at cost of less than 9 cts. a pound.

Miscellaneous Company Notes.

Estimated production of Goldfield Con. for June was \$185,000; net earnings were \$10,000. Net earnings were \$50,693 in May.

J. L. Bruce, manager for the Butte & Superior Co., has been elected a director of the company succeeding the late C. L. F. Robinson.

Anaconda Copper Co. interests say they are not to take over mineral concessions and copper mines of Taganyika Concessions, Ltd., in Belgian Congo and Rhodesia.

Greene-Cananea Copper Co. officials say the situation is unchanged in Cananea, Mexico. Mines are running at 50% capacity. Extra efforts are being made to operate property at full capacity.

Peterson Lake directors will report to their shareholders as to the financial position of the company as follows: One year ago, as of April 30, your company had \$142,687.50 cash in bank, whereas this year the statement will show \$202,859.56 cash in bank. While the royalties received are \$10,000 down, the cash in bank is increased \$60,172.06, and such is recorded after paying the regular quarterly dividends during this

period. Accounts payable at the end of the fiscal year of 1915 were \$7,103.94, whereas this year this item is reduced to \$2,249.34. The above increased profits remain after 20% has been written off on depreciation of plant.

Miami Copper Co. produced 4,516,395 lbs. of copper in June as compared with 4,600,000 in May; Old Dominion produced 3,843,000 in June and 3,405,000 in May; Braden produced 2,258,000 in June and 3,882,000 in May.

Kennecott Copper Co. has acquired the entire \$10,000,000 first mortgage 6% 10-year convertible bonds and the mortgage will now be satisfied. These bonds were issued June 1, 1915, on the entire properties of the Kennecott Mines Co. and Beatson Copper Co., which properties were acquired by the Kennecott Copper Co. The latter's stockholders expect an extra dividend disbursement at the director's meeting in September.

President Seligman of the Butte Copper & Zinc Co. states that Anaconda Copper Mining Co. has exercised its option in full on 100,000 shares of owners' stock of Butte Copper & Zinc Co. under agreement of July 8, 1915. Option matured on July 8, 1916, and the money was paid over. Mr. Seligman further states that Anaconda Co. is energetically prosecuting work of development on eighth level, both east and west, and is driving the crosscut tunnel to cut the company's vein at a depth of 1600 ft. as rapidly as possible.

In the 5 months that Shannon Copper Co. has operated this year net has amounted to \$320,000. In other words, Shannon has in the past 4 months earned about \$1 per share, with production in but 1 month up to normal. On present price of copper and an output of 1,000,000 lbs. per month earnings are better than \$4 per share. Shannon came into June with net working capital in excess of \$750,000, or say a working balance of well over \$500,000 after allowing for the retirement of the \$190,000 outstanding bonds of the Shannon-Arizona railway.

The 40,000 shares of new stock planned to be put out by the American Zinc, Lead & Smelting Co. at \$50 per share are not to be issued, other financing arrangements having been made. The cost of the Granby Con. was \$8,000,000. The vendors take \$2,000,000 of new Granby bonds in part payment. The balance will be financed out of American Zinc cash, \$4,000,000 of which comes back to it through profits on Granby Co. contracts. In brief, it may be stated that on Jan. 1 next American Zinc will have the Granby property paid for, and \$5,000,000 of net quick assets besides, assuming that it does not sell another pound of spelter in the meantime and carries its unsold production at actual cost.

North Butte Copper Co. produced in June 2,096,326 lbs. of copper, 90,713 ozs. silver and 143 ozs. gold. If the June rate of production can be maintained it will mean that the company is once more established on a basis of close to 25,000,000 lbs. of copper per annum. This would naturally lead to some reduction in costs from the level of 12 cts. established in the March 31 quarter. Eleven cents per pound might be all that could reasonably be expected under present wage scale, but even then on a 25,000,000-lb. production the company could earn \$3,500,000 per annum on 25-ct. copper, or at the rate of over \$8 per share on 430,000 shares. This would be a distinct improvement over the first quarter of this year when earnings were at the rate of but \$1.44 per share per annum.

At the present time the U. S. Smelting Co.'s Pachuca and Real del Monte properties in Mexico are running on practically the same schedule as had been attained immediately prior to the crisis between the United States government and the Carranza authorities. The Pachuca mines were closed for a day or two, but not long enough to force any appreciable curtailment of output. The company's American employes are all out of Mexico, but the English have remained, and these in conjunction with native labor have made possible the continuance of operations at these two important properties. It is probably safe to say that Mexican operations are now well above 70% of normal. In the 6 months ended June 30 Pachuca and Real del Monte earned from \$1,250,000 to \$1,400,000 net, or say 20% of total earnings of United States Smelting.

A New Metal Exchange.

The course of values in the foreign metal markets during the past fortnight, furnishes proof positive that the bear raid on copper and spelter values is in full swing, according to the Daily Metal Reporter. Standard copper has declined £31 in the last 30 days; electrolytic has been reduced £17 in that period; spelter has dropped from £70 to £45.

The metals selected for the bear drive because of the principal source of their origin, suffice to show at whom this pulling down of prices is aimed.

If further proof were needed at whom these bear tactics are directed, it is evidenced by the skilful manipulation of the London standard market which concerns a grade of copper that is industrially virtually useless, being qualitatively incomparably inferior to our casting, but prices for which have been juggled with no other object than to force a lowering of the price in American electrolytic copper.

This bear drive is aimed at us, the principal producers of these metals for which England, so long as she needed them for military purposes, was glad to pay our price.

England, as well as her allies, and, for that matter, her foes still need these metals. They will need them more so after the war for the reconstruction of that which has been destroyed.

But the foreign metal buyers are once more in a normal frame of mind and are not losing sight of any stratagem by which they can regain their before-the-war grip on the American metal market.

England and Germany will need tremendously large supplies of these metals after the war, but, if permitted to once more control the market, they will hammer values to bankruptcy levels before covering their (no matter how urgent) requirements. This has been done time and time again.

Do American manufacturers of articles into the making of which these metals enter, want their European competitors to be placed in a position where, because of market control through manipulation, the latter can obtain raw materials of American origin at ridiculously low prices and thus keep American manufacturers out of the world's markets, their cheap labor giving them the preponderance of competitive power?

There is only one way to avoid this calamity from becoming an accomplished fact.

The only remedy lies in having an American metal exchange on which there will be unrestricted, legitimate trading in all metals, so that prices for metals mined, smelted, and refined in the United States may and will be determined by Americans for Americans. Then, and only then, will the foreign buyer be obliged to pay our price for our metals.

We produce the bulk of the world's wheat and cotton supplies and, thank God, production, price and marketing through the Chicago Board of Trade, and

New York and New Orleans Cotton Exchanges, respectively, are controlled by Americans for the benefit of the American producer, the American trader, the American manufacturer and the American consumer. But, while we produce most of the world's copper and spelter, they are controlled by foreign interests through the London and Berlin metal exchanges for the benefit of England and Germany and to the detriment of American miners, refiners, manufacturers and consumers.

Who are the powers behind the New York Metal Exchange and why should they cater to foreign interests in so servile a fashion that this institution has become nothing short of a farce?

Its officials not only admit its fictitious character, but some of them even go so far as to say that they don't want it to be anything but a farce. Their sinister motives need no further elucidation at this time.

If the New York Metal Exchange cannot free itself of these influences and step forth as a real metal exchange which, by reason of its being the mart for American sellers and American as well as foreign buyers of metals, will be as representative, there is only one alternative left.

This alternative is: To establish a new metal exchange.

The Future of Copper.

All possible copper construction in this country must be postponed in order to admit the necessary supplies for the warring nations to go forward is the opinion of an eastern authority on the copper metal industry.

If the war continues well into next year there will be such an accumulation of postponed work in the United States as will sustain the copper market at high prices—say around 20 cts.—for many months after the close of the war.

Credit and copper production are the two things that cannot be pushed. The limitations in each of these fields may be something of a handicap in prolonging the war. The production of steel and spelter and lead can be pushed upward. The possible production of copper is very nearly at the maximum.

There has been less than a 20% expansion in production since the opening of the war and there is not another 20% expansion in sight, however long the war may continue. Inspiration, Kennecott and Utah have made the greatest increase in output and if their increased production had been put upon the market in normal times it would have had a considerable influence upon the price. The hope of the future for any increase in the production of copper is entirely with South America. Both North and South America are now producing about 180,000,000 lbs. per month, and not 200,000,000 lbs., as has been estimated in some newspaper quarters. The production around the first of this year was at the rate of 165,000,000 lbs. per month.

For the few years preceding the war the production of the entire world vibrated around these figures; a monthly production of from 165,000,000 to 185,000,000 lbs. per month, and more than two-thirds of the supply came from America.

Now in the entire world's supply of copper, the American production cannot be far from 80%, and to North and South America alone must Europe look after the war, for its reconstruction from the copper supply.

Previous to the war no country in the world equaled Germany as a manufacturer and exporter of copper wares and she was the largest importer of American copper.

In connection with the outlook for further foreign buying, it is said by well informed metal men that agents of the allied governments are still "nibbling" for a large amount of copper for which they are willing to pay 25 cts. a pound. So far producers have steadfastly refused to shade prices to any such level, and it is not thought likely that they will under present conditions.

From present indications the Lake Superior iron-ore movement will total for the year close to 55,000,000 tons. That is, unless strikes or other factors interfere to any serious extent. During May 8,449,580 tons were shipped, and 9,507,576 in June. From Jan. 1 to July 1, 19,615,567 were shipped, as compared with 11,520,283 tons during the same period in 1915. Up to the present time labor troubles have not interfered to any extent with shipments.

The copper market the past week was dull and lifeless. There is little spot in sight. Inquiries for both domestic and foreign are for the last quarter copper, but these inquiries are reported to be of little consequence. Italy and France have been inquiring for copper for the last quarter, but transactions have gone no farther than the inquiry stage. Copper for October, November, December delivery is quoted 24 cts. a pound.

The Utah Copper Co. is certainly in an enviable position. It does not owe a dollar and at the end of June had net quick assets of over \$20,000,000, of which \$10,000,000 was cash and \$10,000,000 copper in process. In June the company broke all of its production records by producing over 18,000,000 lbs. of copper, approximately 2,000,000 lbs. in excess of any previous month. The company's output is well sold ahead.

The closing of a portion of the markets in Europe is responsible largely for the shipments of zinc to this country from countries that never before marketed this product in the United States. Among those countries which are shipping to this country are Guatemala, French Africa, Costa Rica, Peru, Colombia, China, Italy, Spain and Australia.

PERSONAL.

F. L. Sizer, mining engineer, San Francisco, has been on professional work in Arizona.

T. L. Welp is now superintendent of the Gold Reed Mining & Milling Co., Oatman, Ariz.

M. L. Fuller of the Associated Geological Engineers has started for Cuba to conduct expert investigations.

R. W. Schultz, formerly with the Mond Nickel Co., Nickelton, Ont., is now with the Minerals Separation, Ltd.

M. W. Lee, Duluth, Minn., president of the Marsh Mining Co., has returned to his home from Spokane, Wash.

V. M. Archibald, chief engineer of the Canadian Con. Co., has returned to Trail, B. C., by way of Northport, Wash.

Robert H. Jeffrey, London, England, has been appointed general manager of the Mazapil Copper Co., Saltillo, Coahuila, Mexico.

T. H. Gill, mining engineer at the Champion mine, Nevada City, Cal., is now with the California Accident Commission.

Nelson Stratton, shift boss at the Superior Copper Co.'s property, has been made mining captain at the Lake mine, Michigan.

J. Weaver Loper, president of the Metals Recovery Co., Inc., Spokane, Wash., is in Victoria, B. C., on business for his company.

George Faunce, Jr., Carnegie, Pa., has accepted a position on the engineering staff of the Hercules Mining Co., Wallace, Idaho.

Dr. William B. Phillips has resigned as president of the Colorado School of Mines to look after his extensive kaolin interests in Texas.

Prof. C. K. Leith of the geological department of the University of Wisconsin has been in the Lake Superior copper country during the past week.

Leffler Palmer, mining engineer, Salt Lake City, Utah, has returned from Butte, Mont. He has been on professional work in the Deep Creek-Ferber district.

Charles E. Knox, Berkeley, Cal., president of the Montana, Tonopah and Mizpah Extension companies, has been in Tonopah, Nev., inspecting the properties.

Frederick G. Clapp of the Associated Geological Engineers is in Wyoming, from where he will go to certain Kansas and Oklahoma fields before his return to New York.

Thomas F. Keeley, Chicago, treasurer of the Goldhunter Mining Co., Mullan, Idaho, is in Spokane, Wash., accompanied by J. R. McCormick, Minneapolis, secretary of the company.

A. Van Zwaluwenburg, formerly associated with Walter Harvey Weed in the preparation of the Copper Handbook, has taken a position as chemist for the Nipissing Mines, Ltd., Cobalt, Ont.

Smith Curtis, former British Columbia minister of mines, has been in Montreal, Que., endeavoring to arrange for the opening of a zinc smelter in British Columbia. He is now in Spokane, Wash.

Harold F. McCracken, assistant archaeologist of the Ohio State University and representative of the Museum of Natural History, New York, has left on an exploring trip from McCarthy, Alaska. He intends gathering information for a book and will take about a year for the trip.

Gilbert Rigg, formerly in charge of research work for the New Jersey Zinc Co., is now consulting metallurgist with the Broken Hill Associated Smelters Proprietary Co., Ltd., Port Pirie, Australia.

Edmund Juessen, E. M., San Francisco, is directing development work on the property of the Reward Arizona Mining Co., south of Casa Grande, Ariz., where copper and zinc ores are exposed.

George W. Fraser, smelter superintendent for the Arizona Copper Co., Clifton, Ariz., has left to accept a position as smelter superintendent of the American Copper Syndicate, Ltd.'s, plant at Aroa, Venezuela.

Joseph H. White, sanitary engineer, U. S. Bureau of Mines, has accepted a position with the Braden Copper Co., Chile. He will have charge of sanitary and welfare work at the South American camps of the company.

NEW PUBLICATIONS.

Triangulation in Arizona and New Mexico. By R. B. Marshall. Washington, D. C., U. S. Geological Survey. Bulletin 644 B; pp. 12.

Detailed information is given for the location of government triangulation stations which have been established in the states. Azimuths and distances with respect to stations are given to aid in computations and location on topographic surveys.

Coal Mine Fatalities in the United States, 1870-1914. By Albert H. Fay. Washington, D. C., U. S. Bureau of Mines. Bulletin 115; pp. 370. For sale by Mining World Co. 50 cts.

Besides giving minute and detailed information on coal mine accidents in tabulated form and as discussion for the various years, districts and states, statistics on coal production, labor and mining methods are briefly reviewed with respect to the state and calendar year in which they occur.

Lead and Zinc Deposits in Ontario and in Eastern Canada. By W. L. Uglow. Ontario Bureau of Mines, Toronto, Ont. Annual Report; Vol. XXV; Part II; pp. 56; illustrated.

Separate descriptions are given of the different mines, prospects and deposits located in the area covered by the report. These descriptions are again subdivided according to the nature of the deposits and the probable genesis. The genesis of the deposits is taken up as due to igneous after-action with both high and intermediate temperatures and independent of igneous after-action. Under the latter, deposits with calcite-barite-fluorite-galena veins; and gash-vein impregnations into Paleozoic limestone are described. Besides geology of deposits, the duties and bounties offered by the province for lead and zinc ores produced in the province are considered, with figures on production of the same.

Petroleum Withdrawals and Restorations Affecting the Public Domain. By Max W. Ball. Washington, D. C., U. S. Geological Survey. Bulletin 623; pp. 427. For sale by Mining World Co. \$1.20.

The bulletin contains copies of orders of withdrawal, restoration, modification and classification, and of the more important correspondence leading to changes of policy regarding these. An index to the orders, township by township; a short statement of the purpose of the withdrawal policy and a review of the history of the withdrawal are given. There is also a chapter on oil-land law, giving the statutes and decisions, judicial and departmental, which may be of interest to the operator on public lands. Maps showing the areas withdrawn are given for Arizona, California, Colorado, Louisiana, Montana, North Dakota, Utah and Wyoming, where withdrawals were outstanding on Jan. 15, 1916. No maps are given of Oregon or New Mexico, since all lands in these states have been restored and there is none of Alaska where withdrawal includes all oil-bearing land.

Progress Made in the Manufacturing Industries

Ingersoll-Rand Co.'s Spanish Catalog.

The Ingersoll-Rand Co., 11 Broadway, New York, has issued a catalog in Spanish under the title "Productos de la Ingersoll-Rand." This is attractively and substantially bound and contains 124 pages replete with illustrations, descriptive matter and tabulated data. The catalog covers completely the company's line of air and gas compressors, vacuum

pumps, reciprocating and centrifugal water pumps, rock drilling, metal and coal mining, prospecting and quarrying machinery and pneumatic tools for machine and boiler shop and foundry work. In short, this catalog is a complete reference book which should be of great service to Spanish speaking users of pneumatic machinery.

TRADE PUBLICATIONS.

Oil Filters. Richardson-Phenix Co., Milwaukee, Wis. Bulletin No. 5; illustrated.

These filters for rejuvenating old oil are built in capacities varying from 35 gals. per day to 50,000 gals. per hour. Special applications of the filter in the field where a 22,500-gal. capacity is required are shown. The filters are made in both portable and stationary types and in most cases illustrations and drawings are shown.

Steel Pulleys. Medart Pulley Co., St. Louis, Mo. Folder; illustrated.

The pulleys considered are specially designed for heavy duty work underground, at the smelter, or any place in the surface plant where heavy lifting is necessary. They are made with either single or double arms in the split and solid types. Views of the pulley are shown and followed with a description of the pulley's construction.

Engine Indicators. Trill Indicator Co., Corry, Pa. Booklet; pp. 56; illustrated.

Many reproductions of indicator cards are shown and the defects designated by them are discussed and compared with diagrams shown from engines which are operating correctly. The different types of indicators are discussed and notes are given on the proper springs to be used for various pressures. In this connection instructions are given on the proper methods of interpreting the diagram. Details are given on the construction of both enclosed and outside spring types. Here the function of each part of the indicator is also given.

INDUSTRIAL AND TRADE NOTES.

V. A. Stout, Balboa building, San Francisco, has taken the agency of Smith Engineering Co., Milwaukee, to sell the Telsmith gyratory crusher.

Colorado Iron Works Co., Denver, Colo., announces that L. G. E. Bignell has joined its sales organization. Mr. Bignell has had wide experience gained during his several years' service as sales engineer for the Mine and Smelter Supply Co. at El Paso, Texas, and sales manager for the Denver Engineering Works Co. of Denver.

The Metals Recovery Co. of Spokane, Wash., is installing two 50-ton Bookwalter-Dorland concentrators at two mines near Helena, Mont., for the Montana Metals Recovery Co. One machine will operate on a copper carbonate property, the other on a gold mine. This same company has installed one of its 50-ton machines on the Saskatchewan river, near Edmonton, Alberta, and results from this machine are expected soon.

The third number of "Roebing Wire Rope," the technical wire rope bulletin of the John A. Roebing's Sons Co., Trenton, N. J., has been issued. It contains information on aerial wire rope conveyors (continued), the right and wrong way to measure wire rope, the oldest suspension bridge in America, the Roebing galvanized drop-forged wire rope clip, wire rope practice, incline planes, Roebing wire rope slings and ready reference tables.

The P. M. Power Co., Chicago, has issued a booklet in which the question of powdered fuel is brought to light. It is not for general circulation but is rather loaned out by the company to those directly interested in the question treated on. The title of the publication is "Authentic Data in Relation to Powdered Coal Engineering & Equipment Co.'s System of Fuel Economy and Abatement." The question is discussed in an attempt to bring out that powdered coal is a most economic fuel and eliminates waste made by other fuels.

PATENTS RELATING TO MINING.

Mine-Car Wheel. Carl Clausen, Bisbee, Ariz. (1,190,111; filed April 19, 1916.)

Rock Crusher. Frank B. McCabe, Lewiston, Pa. (1,189,594; filed Sept. 11, 1915.)

Coal-Drilling Machine. Dan Armenti, Cleveland, Ohio. (1,189,901; filed Sept. 4, 1915.)

Crushing Machine. John D. Ochterbeck, Clayton, Mo. (1,189,471; filed Jan. 12, 1914.)

Dumping Car. Albert C. Murphy, New York, N. Y. (1,189,283; filed Oct. 17, 1914.)

Amalgamator. Percy A. Robbins, Timmins, Ontario, Canada. (1,190,012; filed Oct. 10, 1914.)

Excavating Cableway Apparatus. Thomas Spencer Miller, South Orange, N. J. (1,189,605; filed June 4, 1914.)

Metallurgy. Henry Swift Kimball, St. Louis, Mo., assignor to American Zinc Lead & Smelting Co., Boston, Mass. (1,189,830; filed Feb. 4, 1914.)

Apparatus for-and Process of Casting Ingots of Metals and Alloys. Pierre Henri Gaston Durville, Paris, France. (1,189,548; filed Nov. 10, 1913.)

Production of Aluminates from Alunite. Paul R. Hershman and Raymond D. Cooke, Chicago, Ill., assignors to Mineral Products Corporation, New York, N. Y. (1,189,254; filed March 21, 1916.)

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Anchorage.

O. Hansen is now prospecting placer ground and quartz veins at the head of Bird creek.

Work is progressing under Supt. Young on the Lewis River lease of the Bernard interests. Ben Bernard, president of the American Dredge & Construction Co., is now on the ground and it is said more development work is to be started. Young is operating a gasoline drill on the lower end of the canyon and the property is showing up well. He says A. Chittick is shoveling in on Discovery and is taking out an ounce a day. Tom Sutter and partners have a good showing above Discovery, where they turned the river.

Valdez.

Spearsted and Johnson have been working the Millionaire group on Mineral creek and have recently made a good strike. At the end of a 225-ft. tunnel the vein on the Hercules claim was cut at 175 ft. below surface. At this point the vein is 6 ft. wide and carries good values. Ore crushed in a mortar and panned yielded results that are satisfactory to the owners, it is said. A mill has been secured and is now near the mouth of the tunnel ready to be installed. It is of 12 tons' capacity and will be replaced by a larger one as soon as conditions warrant. A concentrating table will also be sent up to the mine and the plant will be in operation before Aug. 1.

Cordova.

Word was brought in by James Galen that Mike Sullivan has made a strike of quartz-bearing copper at Mile 99 station on the Copper River railroad.

A bridge gang is at Mile 52 on Placer river. A crew of 12 men are engaged fixing the road and a clear way to Mile 71 will soon be accomplished. The ice in tunnel No. 1 has been nearly all taken out, only 8 ft. of it remaining.

Knik.

F. B. Cannon, this city, and W. J. Conroy, Anchorage, have started work on their quartz claims on Archangel in the Willow Creek district. There are two groups of claims. Manager Ward is tunneling on the Webfoot group and the property is showing up favorable. The ledge has been stripped for 800 ft., showing values as high as \$50. As this property is near the Mable, Talkeetna and other proven quartz mines, early results are very possible.

The Gold Bullion mine is under a 2-year lease to a Montreal, Canada, syndicate, the Willow Creek Mining Co., under Supt. McAllan. It is employing 70 men at present, and the mine will not close down until Oct. 15. This plant is the farthest north cyanide plant in the world and is of 45-ton capacity. They are running 12 stamps this summer. McAllan says this season's cleanup will pass previous records.

ARIZONA.

Jerome.

Unwatering the shaft sunk by former owner—Haynes Copper—on the property of the Jerome Victor Extension Copper Co. is being accomplished at the rate of about 100 ft. per week. As soon as the workings are entirely freed from water the management will put on three shifts and develop the mine. Operations are in charge of George W. Salisbury, who for a number of years was a member of the engineering staff of the United Verde property, adjoining on the west.

Salisbury brings to the development of the latter the knowledge of the ore depositions of the Verde district gained during his service in the United Verde. The plant of machinery installed by the Haynes people is being utilized for present needs, but later will be superseded by a modern and more efficient one.

Six hundred thousand tons of ore is blocked out on the 1400 level of the United Verde Extension mine. A careful sampling of this large tonnage shows that it averaged about 16% copper. It has been developed by about 2000 ft. of lateral work and by two upraises of 100 ft. each. A winze is being sunk near the center of this body, the objective being a depth of 200 ft. The management has in view the sinking of a new double-compartment shaft to be used exclusively for hoisting ore. Upon completion of this shaft and of the winze before referred to, the shaft on the company's Edith claim will be sunk to the sulphide ore area. Approximately 7000 tons of ore carrying an average of 20% copper is being shipped to smelter each month. The net profits therefrom for several months past have been about \$350,000 per month. The company has cash on hand totaling \$793,882.72, and has due it from ore shipments approximately \$1,000,000, making a grand total of \$1,793,882.72. Despite this large reserve, it has been decided to accumulate an even larger surplus for the purpose of developing the mine and building a smelter. Quarterly dividends of 50 cts. per share will, however, not be affected by this decision.

Save for minor details the deal is practically closed whereby G. W. Hull transfers his mining holdings in the Verde District to the Clark interests. One million dollars is said to be the amount involved, and in consideration therefor Hull turns over his individual holdings and likewise his controlling interests in the Hull Copper, Con. King, Columbia and Cleopatra Mining companies. Deeds have already been issued transferring Hull's individual holdings to the Clarks, and passing to them of his controlling interests in the companies mentioned is said to be assured.

Prescott.

A contract has been let for sinking the main workings shaft on the C. B. S. property an additional 100 ft. This property is located in the Copper Basin district, where are also located the Commercial mine, shipping 100 tons of copper oxides daily, the Loma Prieta, showing 70 ft. of chalcopyrite in its shaft, the Schuber Copper, the Copper Hill, and the McNulty and McBride holdings, all of which appear to be in line for production. Copper Basin is directly tributary to Prescott and is considered to be the most promising copper ore section in Yavapai county, aside from the Verde district. R. M. Martin, owner of the C. B. S., is said to have one of the best copper ore showings in the Basin, and this opinion has been strengthened by disclosures in the old workings which were recently cleaned out and placed in working order.

Ray.

After consultation with General Manager Adams of the Ray Hercules Copper Co. in New York the directors have decided to build a 1000-ton plant. The buildings to be constructed will be large enough to accommodate equipment for a 2000-ton plant. The mill as now contemplated will cost about \$300,000. For possibly 2 years the management does not expect it to be in operation. The Callow flotation process will be installed. Ore taken from 2 drill holes has resulted in a satisfactory recovery. The extraction from one hole averaged better than 91%, while about 88% was recovered in the other. The company has been shipping carbonate ores, the proceeds from which have materially aided in paying for development. While the property could ship 50 tons daily, the smelters will take but 30 tons. A three-compartment

ment shaft has been sunk 300 ft. and crosscutting will start when the 500 level has been reached. Development work has resulted in a material increase in ore reserves, 3,400,000 tons reported September, 1915.

Miami.

The Inspiration Needles Copper Co. has laid 4800 ft. of 2-in. water pipe which is connected with the pumping plant of the Miami Southwestern and which will furnish an adequate water supply to the two churn drills now on the ground. Drilling has been resumed and work will be rushed day and night in drilling and running the main tunnel. It is the present intention of the company to keep on adding drills until the number reaches seven. All lumber and material are now on the ground for the erection of mess and boarding houses, blacksmith shop, assay office and the general offices of the company.

Ajo.

The Ajo Con. Copper Co. is developing the eastern extension of the new Cornelia ore zone. James Phillips Jr., New York, is president; Walter M. Briggs is vice president. The property is under the management of James P. Gaskill, who has been directing the work of three diamond drills on the group during the last year. Drill holes have been sunk 200 to 750 ft. On the western part of the property the ore deposit is exposed at the surface, but farther eastward it dips about 50° and is covered by conglomerate and rhyolite. This ore

which means the camp is starting right. It is an easy matter to see and determine that the chances for a big and prosperous camp in and around Parker are very good. Any one familiar with mining can not see where failure has any chance to creep in. There is also strong talk of a good size plant for reducing the ore going in at Parker, which would mean a big saving over ordinary smelting. The parties owning and controlling this process were on the ground while the writer was there and was well pleased with conditions in general. The chances are a plant of good size will be in active operation in the near future.

CALIFORNIA.

Alleghany.

A ball-mill having a capacity of 100 tons per day is being installed at the Ireland mine and will operate in conjunction with the stamp mill at present in commission. The Ireland has been developing splendidly in the past 6 months and a good tonnage of profitable ore is blocked out. Specimen ore has been extracted recently. A. Copps is superintendent.

Under the direction of Supt. Wagner an extensive amount of new work is proceeding at the El Dorado group

AJO CON. PROPERTY, ARIZONA.

body is being explored on its dip by drill holes. At the greater depth of ore, as found on its dip, it is composed of chalcopryrite and bornite. The ores near the surface are of high grade, and consist of oxides and carbonates of copper. The sulphides, found at greater depth, assay about 1.75% copper. The property is developed by three shafts and 5000 ft. of lateral work. Fred Osborn is assistant in directing this work.

Parker.

Parker is on the Arizona side of the Colorado river on a branch of the Santa Fe road, running from Cadiz to Phoenix. A fine steel bridge crosses the Colorado river at Parker, which is 1500 ft. in length. The Colorado river cuts the mineralized zone at this point, part of it being in San Bernardino county, California, and part in Yuma county, Arizona. I find both sides of the river carries practically the same mineral formation and as far as I could see from my inspection the ore encountered carries principally gold and copper. I found good properties on both sides of the river, and car loads of ore are being shipped daily from Parker to the different smelters. The ore that is being shipped is high grade, some of it running over \$100 in car lots. This section is just coming to the front and the time is not far distant when both sides of the river will have big producing mines and a large tonnage of good pay ore will be shipped daily. Reliable parties are already interested in that section,

of 3 claims on Kanaka creek. Arrangements have been made for the installation of an electric motor and 8-drill compressor. The company owns extensive water rights. The vein is developing well, seams of rich quartz frequently occurring with the milling product; 30 men are employed.

Driving of the Red Star tunnel is proceeding steadily at the Tightner mine and the work is entering interesting territory. The Red Star vein yielded much specimen ore in the old workings of the Red Star mine and is expected to produce well at depth. In the main Tightner workings ore of milling grade continues to be exposed. The 10-stamp mill is running steadily.

Yreka.

The main ledge of the Old Flag mine, in the Humburg district, has been intersected in the lower tunnel. It is 9 ins. wide near point of discovery and is gradually broadening out. The quartz is of specimen character. It is planned to purchase hoisting equipment and to sink a shaft to open the vein to advantage. Capt. I. T. C. Nash, of Berkeley, is managing owner.

The Victory Gold Mines Co. has installed a 50-ton concentrating plant at its property in the Salmon River district, purchased a motor truck for transportation of ore from mine to mill, and is erecting a 300-ft. tramway from the main tunnel to the loading bins. Lateral work has uncovered a

3-ft. ledge of good ore for upward of 270 ft. and sinking on the vein will soon start. The Victory is the extension of the Advance mine, long famous for its specimen quartz. John Nefroney is manager.

Colfax.

Salt Lake people, represented locally by H. J. Dykes, have bonded the Adventure gold mine in the Iowa Hill district and are erecting a 5-stamp mill. Developments consist principally of tunnel work, and the ore assays around \$15. The Adventure is owned by R. L. Turner of Colfax.

Lincoln.

Operations have been resumed at the Algo copper mine and equipment installed. Considerable ore of excellent grade has been exposed in the upper workings and under the new management the property is expected to soon become a good shipper. B. C. Musher and H. P. Sartain of Lincoln are the chief owners.

Heroult.

The Noble Electric Steel Co. has acquired a manganese property near Lowrey, west of Red Bluff, and is shipping 50 tons per day to the electric smelter at this place. The ore is stated to be high-grade and the deposit appears to be quite extensive, the ore body being fully 75 ft. wide. Developments are proceeding with a force of 50 men. Friction with the owner of the Bear Canyon manganese mine, near Clipper Mills, has temporarily resulted in suspension of shipments from that point.

Amador City.

The new mill at the Treasure mine went into commission last week on good ore from the lower levels. The company recently sunk a shaft and prosecuted much deep work with satisfactory results. Sufficient ore is exposed to insure a long period of production, and developments are augmenting the visible reserves. J. H. Bell is superintendent.

Nevada City.

Nevada people, under the management of W. H. Tuttle, are unwatering the Texas mine in Willow valley, preliminary to extensive operations. Retimbering of the shaft and tunnel has been completed and active mining will start in a few weeks. Together with the Texas the adjoining Niagara and Durbin properties will be energetically worked.

It is reported mining is about to begin at the Murchie mine, taken under option recently by New York people. The Murchie has yielded well in the past but has not been worked to any extent in recent years. The size and character of veins are similar to those found in the Champion group.

Washington.

Shipments of chrome ore are being made to eastern mills from the Red Ledge gold mine at this place. The chrome is found in small deposits and is stated to be of high quality. Production of gold is going on steadily, the 6-ft. vein recently encountered developing well. A number of properties in the Grass Valley, Nevada City and Washington districts are benefiting from the demand for manganese, tungsten, and chrome, small quantities of these minerals being often found with the gold-quartz deposits.

Forks of Salmon.

The present season is proving an unusually long one for the hydraulic and placer miners. Snow is still piled in the hills and sufficient water is available at many points to facilitate operations by the leading companies well into August. The Forks of Salmon, Michigan Salmon, and other companies are recording a highly prosperous year.

Angels Camp.

Sinking from the 2700 level of the Utica mine is proceeding steadily and the shaft is expected to encounter the junction of the Gold Cliff and Utica veins within a few hundred feet. The mill at the Gold Cliff is crushing about 6000 tons per month, and a good tonnage is also coming from the Cross workings. Some specimen ore continues to be extracted from the vein recently tapped on the 1800 level of the Gold Cliff.

Porterville.

A new deposit of rich ore has been opened on the property of the Magnesite Mining Co., north of Porterville. The ore body is 14 ft. wide with streaks of the material assaying over 95% magnesite. R. A. Smith is superintendent. The

Rex Plaster Co. of Los Angeles has purchased 160 acres of magnesite ground near here and is arranging for steady shipments to Los Angeles. Several other companies are very active and an immense amount of new territory has been brought within the productive zone in the past half-year. About 700 men are employed by the companies operating in this district.

Redding.

One of the new directors and a leading stockholder in Afterthought Mining Co. is expected to come here from the east in July, and he is reported as stating that the company has been financed and that the mine will be equipped and put on a producing basis as rapidly as men and money can accomplish it.

Mokelumne Hill.

The International Investment Syndicate, Los Angeles, is building a 50-ton mill for crushing ore and recovering gold by plate amalgamation and vanner concentration. Plans have been drawn by Otto Wartenmeiler, M. E., Los Angeles. Electric power will be used.

COLORADO.

Cripple Creek.

On the 12th carpenters started the work of enlarging the bins at the Dillon shaft of the Granite Gold Mining Co. The present capacity, recently completed, is 200 tons, and this is to be increased to 350. With this addition the output will be increased from 70 tons daily to 100. The ore now being shipped from the shoot under development at the 1400 level is holding well in value. It is expected the shoot will shortly be proven continuous at the 1600 level, where a cross-cut is being carried to the shoot.

Tom Tibbetts is operating the Puzzle claim and soon expects to have the property in shape for production. Operating through the Ophelia tunnel, he is drifting on a well-defined vein measuring 3 ft. wide and carrying a streak from 10 ins. to 1 ft. wide. It carries values in gold, silver and lead. Tests of the quartz showing galena have given returns of better than 1 oz. gold, 10 ozs. silver and 12% lead, a total value in excess of \$30. This ore is going into the bins and a shipment will shortly be ready.

Work has again been resumed in the Roosevelt tunnel, and the present flow from the portal of 13,500 gpm. will probably be increased. For the past 6 weeks the force has been engaged in cutting the station at the tunnel level, where it connects with the Elkton Con. Co.'s main shaft, that is where they are raising to connect with the shaft. They are cutting out other stations at the tunnel level, one for a stable for mules and the other for the ventilating fan. The heading of the tunnel is now in the Ramona claim, located northwest of the Elkton, and will shortly pass into the Crank lode mining claim to the north.

The Reed mill at the Dante property is now running smoothly. It is treating between 45 and 50 tons of dump ore from the Gold Sovereign mine daily, the tonnage having been recently increased. The Gold Sovereign dump ore assays between \$3 and \$4, and it is estimated the saving affected will be close to 90%. The first gold brick was sent from the mine about July 11.

Leadville.

According to S. P. McDonald the enlargement of the bottom station at the Penrose shaft has been completed. Ten feet have been added to the height of the station to allow the installation of a new electric pump and motor. The motor is the largest of its type in the district, having 650-hp. When in place in the station it will stand 30 ft. above the pump to allow the greatest possible distance between the water level and the motor. A drift from the top of the station is being driven to cut the shaft for providing air circulation for the motor. This drift will be 50 ft. long. Preparations are being made for the installation of the station pump and motor. Everything will be in shape for the machinery as soon as drifting is finished. No mining on a large scale has been undertaken. The work of cleaning out the upper levels continues and a large part of the old workings are now in

shape for operation. The fact that one of the hoisting compartments is still being used for operation of one of the sinking pumps limits mining to a minimum.

The Western Zinc Oxide Co. started the construction of a block of four new furnaces. The building over the furnace has been completed and a 350-ft. cooling pipe has been added. The furnaces are about half complete and will be blown in not later than Aug. 1. It is planned to add a roasting plant to the smelter and handle sulphide ore. The supply of carbonate, although sufficient for the requirements of the smelter at this time, is not as great as was planned on. The addition of facilities for the handling of sulphide will open an unlimited supply of ore and make it possible for the plant to greatly increase production. Steady shipments of carbonate are being received from the Baby, California gulch; the Little Sliver, Fryer hill, and Mikado on Iron hill.

Rico.

Impressed with the showings of development work at the Rico-Argentine, F. W. Price, who recently visited the property, says: "The main tunnel is in 380 ft. and there is 100 ft. to drive to get under the Copper stope, from which I am reliably informed more than \$2,000,000 was extracted. The downward extension of the ore will be cut at an additional depth of between 350 to 400 ft. The Honduras vein, on which work is now under way, shows strong. In the face of the tunnel the vein is between 4 and 5 ft. wide and filled with splendid gangue material. To the left of this face is a bed of ore 4 ft. wide, with no hanging or foot wall in sight. I have recommended that power drills be installed and the work of opening up the ground be rushed."

IDAHO.

Wallace.

The strike in the Union mine, now under lease to the Sherman Development Co., is even more important than at first anticipated, according to Harry L. Allen, a stockholder in the leasing concern. "When we closed down work in the Union mine on the 3d for the holidays we had a showing of 3½ ft. of fine ore in the face of the east drift from the Oreano tunnel. Since we cut the Union ledge in the Sherman claim by a crosscut from the Oreano tunnel we have drifted 300 ft. and have had ore continuously, though not the full width of the workings all the time. We will now open up the vein at an added depth of 480 ft. by an extension of the old Hidden Treasure tunnel. To reach the portion of the Sherman ground in which we are now drifting with the Hidden Treasure tunnel will involve its extension for 1800 ft., and to provide for this work we have set aside \$30,000 and are equipping the mine with a compressor. The face of the Hidden Treasure tunnel was in iron ore, a showing which had been undisturbed for many years, when we punched a hole into one side of it and disclosed a good body of galena ore. The ore body opened in the Union mine is composed of galena and zinc sulphides, much of it being rich enough to hand sort and ship. The clean galena has been found to average close to 70% lead and 50 ozs. silver, and the solid black jack about 42% zinc with low silver values."

At the meeting of the directors of the Success Mining Co. on the 10th declared the regular monthly dividend of 3 cts., or \$45,000, payable the 25th to stockholders of record the 15th. This will make the disbursements for the current year \$345,000 and will increase the grand total to \$1,940,000, including \$900,000 credited to the old Granite Mining Co., which owned and operated the property prior to the organization of the Success corporation.

Kellogg.

Having practically exhausted the ore resources of the Stewart mine, the Stewart Mining Co. is preparing to invade other fields to prolong the active life of the corporation, and at a stockholders' meeting recently the capitalization was increased from 1,250,000 shares, of which 1,238,362 are issued, to 3,000,000 shares at \$1 each. It was announced at the conference that two properties in Nevada, recently examined by William A. Beaundry, general manager, probably would

be taken over soon, and that three Idaho properties, presumably in the Coeur d'Alenes, were now being examined with a view to their purchase. President Hiram C. Tood and Vice-President Charles W. Saacks have been authorized to purchase any desirable properties that can be authorized at a satisfactory figure, and finances for the purchases and to operate the acquired holdings are to be secured from the sale of the increased capital stock.

Mullan.

The National Copper Mining Co. has decided to suspend operations at its mine and mill. Following statement by Charles McKinnis, secretary, has been made: "During June the property was given a fair try-out with the new equipment and under the best possible working conditions. The mining costs were low, but the milling costs were higher than expected, due principally to hard rock, which made machinery repair costs high. The decision of the directors is that the ore is too low grade to pay a profit, even at the prevailing prices of copper. Different suggestions have been made by stockholders about sinking deeper, or driving a lower tunnel, on the presumption that richer ore might be found. No action has been taken on these suggestions. A complete statement of the June operations will be made to the stockholders as soon as complete smelter returns are in, showing all costs in detail."

Orogrande.

It is reported that James Mazua of Spokane, one of the large stockholders in the International Gold Mining & Milling Co., reports a rich strike of 20 ins. of gold ore on the Riverside fraction owned by that company in the Orogrande district. The full width of the ore is said to run \$100. The strike is in a tunnel a distance of 200 ft. and was made about 10 days ago. The company is negotiating for an improved mill which will cost \$15,000 and which it expects to have ready for operation by Oct. 1. It has had a two-stamp mill in operation, but the stamps are only 150 lbs. each and the plant was otherwise inadequate. The new one is expected to be able to handle 25 tons of ore a day. There are said to be 2000 ft. of tunnels and shafts on this property. The No. 1 tunnel is all in ore and 48 open cuts have exposed the ore for 1000 ft. on the surface. Most of the stockholders and all of the officers of the company are Spokane men. James Tyra is president, D. Miloradovich is vice-president, James Mazua, secretary-treasurer and Loui Scassy and Neil Johnson are the other directors.

LAKE SUPERIOR.

COPPER.

Houghton.

Lake is now making preparations to unwater and open up a shaft located on the Knowlton lode in order to explore the latter, and probably the Mass, North Butler and Butler lodes, the last named, the southernmost, being 415 ft. distant from the Knowlton.

Adventure has retimbered the 80-ft. collar and has now begun to overhaul the timbering of the shaft itself, and as soon as a level is reached that looks promising drifting will be started.

Michigan is still in the high-grade copper of the Butler lode—mass of all sizes—and has advanced its drifts about 125 ft. to the east of the shaft and a little to the west.

New Arcadian is getting the same grades of stamp rock in the north drift of the lode discovered 265 ft. west of the first shaft on the 50 level. The shaft pit in the overburden is down about 25 ft. and has just uncovered the top of the ledge where considerable copper is seen on the outcrop of the lode, and it is located about 50 ft. north of the junction of the lode and the crosscut. John J. Michels, a Houghton contractor, is putting up the buildings, and in about 60 days the new hoist will be running. The sinking from the bottom level, the 1250 to the 1400, is being pushed as fast as possible; two drills are being operated.

Quincy has put in an electric pump at the 6th level of the No. 9 shaft and is utilizing the water that is the result of a filtration through the rock above. It is very pure and greatly

resembles the best spring water. A complete system of pipes is being laid, and a standpipe has been erected. No. 8 shaft has the same kind of water, and pipes will be soon laid there and the water supplied in the same way.

Winona is being inspected by Pres. C. H. Paine, Jr., of Boston, who will also visit the Houghton Copper, the Mayflower and other properties that the St. Mary's Mineral Land Co. is interested in.

Isle Royale's increase of tonnage that is treated at its own mill is due principally to the working of the stamps to the highest limit. Since the completion of the new mill, the daily tonnage stamped has been about 2200 as compared with 1800 at the old mill.

South Lake has just made arrangements with Lake so that there will be a connection of the drifts on the sixth level of South lode No. 2 on which the latter is thought to be mining, so that a better ventilation can be had for both mines, that a knowledge of the intervening ground can be obtained, and any doubt that may exist as to the lodes being the same will be dispelled. The distance to be covered by drifts on each side is less than 500 ft.

Victoria produced at the mill 102 tons of mineral for June as compared with 83 for May. The new skipway is practically completed, but the work of installing the new Nordberg hoist is being delayed by the continued difficulty of getting surface men even when the wages have been increased 20 cts. a day. There was also an increase for the underground men of 25 cts. Work is being continued on the 19th level west and on the 11th east, and resumed on the bottom level, the 26th east. In all these levels the rock is averaging good. The eastern level on the 26th is in especially good ground.

Franklin has been shipping its mineral and mass to the Quincy smelter, but as its quantity is constantly increasing, it was becoming too much to be handled without inconvenience, and Pres. Edwards made arrangements for the future Copper Range to handle it at the Michigan smelter, 3 miles north of Houghton.

Calumet & Hecla is not now sinking at any of its shafts on the conglomerate or on the Osceola amygdaloid, as miners are none too plenty, and as everywhere there is plenty of ground not yet opened by drifts.

Contact has discontinued its diamond drilling, having found a most excellent amygdaloid in four of the five holes drilled at this time, but no copper. The Wyandot No. 8 is the lode that is being explored; and is giving good values, and here there was never exposed a better amygdaloid—one that if it had been visited by the copper would have received a fine deposit. The showing at the Wyandot would warrant a shaft being sunk here, but the funds are low and assessments on properties that give no great promise would not be very successful just now. At some future time when there is more interest in coppers or if Wyandot continues to make the favorable showing it is doing now it is probable that the exploratory work will be taken up again.

New York Con., which lies a half a mile north of the Seneca in Secs. 3, 5 and 10, T. 57 N., R. 32 W., and which comprises 720 acres, has just been sold by Receiver F. W. Nichols to R. H. Rickard, for \$4850, the amount of the claims against it. It was a defunct company, which had had two charters, and which has been dissolved by order of the court. It has been owned from the first down to the present time by the Rickard and Palmer families; some work was done on it in the early days, some 60 years ago. The New York carries the Osceola amygdaloid, Calumet & Hecla and some other of the lodes to the west. There is no intention of doing any exploration on it at the present time. Rickard, whose residence is in New York, has quite large holdings of land on the peninsula and is making a short stay in this district for the purpose of settling the affairs of this company, and looking after his other interests.

Hancock held its annual meeting June 21 and the old directorate was re-elected with one exception, J. H. Hicock, secretary-treasurer, succeeding F. W. Nichols, the local agent of the St. Mary's Mineral Land Co., who no longer hold any stock, having distributed theirs to their stockholders. The other directors are A. F. Rees, J. D. Cuddihy, S. E. Harris and Jas. Hoatson. F. M. Preucil, J. H. Hammel and D. C.

Purdy of Chicago, representing themselves and other stockholders, were present at the meeting, and visited the mine and other points of interest in the district. Preucil has made the trip for a number of years.

IRON.

Negaunee, Mich.

The hydro-electric plant being constructed by the Cleveland-Cliffs Co. north of here will be finished about Sept. 15. There are about 30 men working. The power house, which is of brick upon a concrete foundation, is completed. The machinery has arrived and is being assembled. The equipment will be similar to that generally used. The power will be generated by a 1000-kw. dynamo direct connected to a turbine. The power will be transmitted to the Maas mine, where it will be distributed over the main lines of the company. The transmission line from the mine to the plant has been completed. The dam behind which the water will be stored was built several years ago by the lumber companies operating in the vicinity, to get power for the hoist. It is of the crib type, rock-filled, and only needs slight repairs to again make it serviceable. A water head of 100 ft. is obtained. The purpose of the plant is to provide increased power to take care of the load which is constantly being put on the lines, and which is at present being taken care of solely by the plant near Marquette. There has been water enough to allow the hydro-electric plant to carry the load alone without aid from the steam turbo-generator at the Maas, which has been idle since last fall, but the consumption of current has grown to an extent that makes an auxiliary plant advisable.

The new rock crushing plant at the Hard Ore mine of the Oliver Co. is now in operation. The frame is 100 ft. high and is constructed of steel. Carpenters are covering the structure. Two engines are used. One hoists the ore from the pockets and the other operates the crushers. The ore first passes through the large crusher, which is installed above two smaller ones. The latter stand side by side, and separate revolving screens lead to them. The crushed ore is a 2-in. size. Some 15 men are employed at the plant. The ore is hard, but there has not been a breakdown since the plant went into operation. The ore, as it comes from the mine, is dumped into the pockets on the west side of the plant and the empty cars are run down to the pockets leading from the crusher, so that no extra switching is required. The plant is crushing from 2000 to 2500 tons per 10 hours.

MISSOURI-KANSAS.

Joplin, Mo.

Conditions in the Joplin field for week ending the 15th showed a marked readjustment in the matter of the ore output, with a desire on the part of the operators toward lessening the accumulating surplus stocks, and also waiting reduction in cost of mine and mill supplies. Many of the operators had already closed down where the cost of operation was too close. Others are following voluntarily. An enforced curtailment came from the failure of power from the Empire District Electric Power Co. This is especially felt in the large sheet ground fields in Webb City, Carterville and Prosperity. It is believed that fully 2500 tons of concentrates were cut from this week's production.

One of the undertakings which promises a considerable activity in a camp long neglected is that of C. M. Sheldon and associates in the old Peacock camp, just across the line in Kansas. This concern has undertaken to build a dike along the bank of Spring river to prevent flooding during high water. This dike is 1500 ft. long, most of which is made of concrete, heavily riprapped. During the recent construction work the heaviest flood the river has seen for years took place and completely washed away over half of the dike which was in the process of construction. Large Texas pumps are now draining the ground and have brought the water level down to 80 ft. The drainage will be continued until the water is brought down to the old levels at 130 to 180 ft., at which point the company expects to resume mining operations. The company is also building a

MONTANA.

mill which will be ready for treating the ores as soon as the drainage of the ground is completed. The company expects to sublease a considerable portion of the old camp. The recovery from this old camp after being under water for 10 years will bring to life one of the heaviest producers the district has ever known. It is from this camp that the United Zinc Co. earned its greatest dividends.

On the C. F. Martin land north of Galena Heights Bob and M. J. Andrews and associates are constructing a new 200-ton mill. This plant is expected to be ready for operation by Aug. 15. The company has put down 15 drill holes over a 40-acre lease, and has opened up a very extensive ore body at the 150 level. The ground was operated about 15 years ago; \$25,000 worth of ore was taken out at shallow level. The company has opened up the old shafts but will in addition sink several new shafts.

On the old Powhattan lease at Thoms Station, the Short Land & Mining Co. is completing the erection of a new 200 mill. This mine was extensively worked several years ago. The upper portion of the workings showing a recovery of 15 to 25% zinc. The lower levels developed sheet ground which ran from 3 to 4% zinc. The new company expects to work the lower ground and clean up the old upper workings in an effort to prospect some of the richer runs on that level. This work is being done by J. M. Short who is the former operator of the Powhattan lease.

The Culbert Lead & Zinc Mining Co. is erecting a 150-ton concentrating plant on the Missouri Lead & Zinc Co.'s land southeast of Joplin. The mill is being erected on a well-developed lease which shows a shallow ore deposit on the 40 to 60 ft.-level.

The Poor Boy's Mining Co. is sinking a shaft 176 ft. deep to open a run of ore at that level by prospecting. The company holds a 40-acre lease on the U. R. Hogset place. The company operated for a while on a run of lead ore at the 40 level, that portion of the deposit having been cut out prospecting for a lower level was undertaken and was successful. Jesse Ader of Webb City is general manager of the property.

Galena, Kans.

Dr. Carl Mining Co. holding a 50-acre lease on the Shoman and Stoice land just south of the Galena smelter, has started the erection of a modern concentrating plant. Drilling showed good ore in 5 holes. Contract has been let for 6000 ft. of drilling.

Glen Toms and associates have opened a rich prospect on the Little Homestake mining lease at a depth of 65 ft; 700 tons were hauled out and show a recovery of 10% lead and zinc. The ore is free, and the concentrates run 62% zinc.

Mooney & Co. owning a lease on adjoining ground have taken out some very rich ore at the 100 level running 15% zinc. Most of the mines on this lease were drowned out by the recent flood.

Vincent & Co. holding a lease on the Homestake ground lost their shaft by caving ground and are just now completing a new shaft down to the 60 level, and are just getting into the ore.

The prospecting west of Baxter Springs continues to attract attention, being an extension of the Miami district up into Kansas, the number of prospect drills moving from the Oklahoma camp across the line has been very large. One of the important strikes recently made was that on the Harry Harris tract, west of Blue Mound. Harris put down one hole to test out a number that had previously been put down, which showed 39% zinc. He is now engaged in sinking a shaft which encountered the ore at 235 ft.

W. C. Frisbie and H. L. Freeman of Joplin have leased the Bob Parr land, west of Baxter Springs, and have started sinking a shaft. The same company has leased the Mulberry and is installing new machinery and boilers to unwater the old mine at once. W. J. Shaddin of Baxter Springs is the owner of the Mulberry lease.

Harley Wells and associates are prospecting a lease southwest of Baxter Springs on the Thomas land. Ore was struck at 66 ft. and continued down to 90. Both lead and zinc showed in the cuttings, but zinc predominated. Other drilling will be done.

Butte.

Butte employes are enjoying the greatest payroll in the history of the camp. For the month ending the 15th the payroll amounted to approximately \$3,500,000. The miners employed by the Anaconda Copper Mining Co. received their pay checks for the Butte mines, amounting to \$1,567,719. This is the largest ever paid by this company to its miners. This does not include the payroll for the general offices, including the legal or geological departments and other offices, nor does it include the payroll of the hardware department, nor of any of the subsidiary companies. It does not include the payroll of the Washoe smelter or any of the other departments of the company located at Anaconda. The entire payroll of the big company is estimated at close to \$2,500,000 alone, if the Great Falls plant and other divisions are included with those mentioned above. The payroll of the Butte & Superior Mining Co., including the mine, mill and general offices, amounted close to \$300,000. The payroll of the North Butte Co. was \$160,331. The men were paid on Friday last. The payrolls of the East Butte, Davis-Daly, Butte-Ballaklava, Butte & Zenith, Butte & Great Falls, Elm Orlu and Timber Butte Milling companies, Tuolumne, Colusa-Leonard Extension, Butte & London, Rainbow Development and many other companies operating in this district add fully \$300,000 more.

The water in the Ophir shaft of the Butte-Detroit property has been lowered 1000 ft. The shaft has been found to be in good condition, although in some places some retimbering is necessary. The management expects to have the shaft unwatered within 10 days now, and within a month expects to begin sinking. The 500 station has been cleared and the old pump at this station, which had been submerged, has been placed in good working order. It is planned to cut a pumping and working station at the 1000.

The Barnes-King mill at Kendall ran 14 days in June and treated 945 tons of ore. The cleanup, however, not complete, amounted to about \$7800. The power plant, purchased from the Kendall Gold Mining Co., has been in need of repairs for some time, and when these repairs were undertaken on June 15 it was found that the time required to make them was much greater than anticipated. Mining and milling operations were resumed July 1. The Piegan-Gloster mill was in operation 8 days, and was then shut down, without a cleanup from the treatment of 700 tons. The installation of new machinery, required for the treatment of Shannon ore, made this shutdown necessary. The pumping equipment for the Gloster shaft, which was promised for March 15, has not yet arrived, and consequently there has been a delay in unwatering the deeper workings of the mine. However, the mine is now drained to the 500 level, and it is expected that there will not be much further delay in unwatering the winze below the 500, when the extraction of the good ore, which it is believed exists below the 500, will begin. The Shannon, on account of slow delivery of building material and much bad weather in the spring, the construction of the aerial tramway has been delayed, but it is now probable that it will be completed this month, and the treatment of ore at the Gloster mill will then proceed. The Shannon vein on the tunnel level is being explored to the west, but has not yet discovered a new ore shoot. The work on the Woodrow Wilson was continued on tunnels Nos. 2 and 3, a distance of 105 ft. being driven. No. 1 tunnel was timbered where beginning to cave. During the month the snow largely disappeared, and then the ground was covered with a fresh fall to a depth of over a foot. That also disappeared, with the exception of drifts, leaving the ground saturated with moisture. Very good surface showings in shallow cuts were exposed by the going of the snow between No. 1 and No. 2 tunnels.

Reports of the Washoe smelter on carload shipments from the Nancy Hanks mine indicate that this property has again joined the ranks of the producers. For several years and up to 3 or 4 years ago this mine was the largest producer of the Garnet district, but it was closed when the ore supply apparently was exhausted. It was thought then that the vein

had badly faulted, but under the new management, in sinking from the 300 to the 400 levels, the vein was picked up at the 380. Sam Richie, former owner of the mine, was in Butte recently. According to Richie the vein is 30 ins. wide. The ore ranged in value between 4 and 5 ozs. gold on the 300 level and at the 380, where the vein was picked up, the richest shipment returned 9.3 ozs. silver, \$12.60 gold and 3¼% copper. The ore is hoisted through an incline shaft and all shipments are made to the Washoe smelter, cars being loaded at Bearmouth, 11 miles from Garnet, the nearest railroad point.

Daily shipments of 75 tons of silver-zinc concentrates are being made from the Comet mine in Highore gulch, under the ownership of the Montana Con. Mining Co. The mill belonging to this company and in which the product is being treated has a daily capacity of 150 tons. There is a considerable tonnage of ore blocked out and the management hopes to increase the mill output within a short time.

Helena.

At least a car of ore a day will be shipped from the property of the Helena Scratch Gravel Mining Co., according to Captain Hosking, superintendent. The company is now opening up extensive bodies of ore in the B. and B. and Armilda groups in Ophir gulch. Owing to the heavy rains of the past few weeks, however, shipments have been seriously delayed. It is planned to put on ten 4-horse teams as soon as the roads are in suitable condition, which will probably be within the next few days. The bins are filled with ore. There are several hundred tons of ore already stripped and ready for blasting as soon as the ore which has already been taken out can be taken out of the way.

In the Cone Butte district in the Judith mountains Chas. Edwards and Jack Leonard are developing the Lost Cabin group on Elk mountain by sinking a shaft. A depth of 40 ft. shows a vein 4 ft. 8 ins. wide. An average sample of 50 lbs. from this vein sent to Butte for assay showed \$3.60 in gold, 17 ozs. silver and 18% lead.

Also Badger & Winston, who are working the Green-Morrison group in this district, sank a shaft 50 ft. and ran a crosscut, cutting a vein 10 ft. wide that goes 60% in lead.

Elk mountain, where those properties are located, is given special mention in the U. S. Geological Survey of 1898 of the Judith mountains, as to geologic condition; also by B. F. Hoyt in his report on the "Golden Eagle" and "Accident" properties in this district. Those properties will soon ship ore, and are within 5 miles of the railroad.

NEVADA.

Goldfield.

The new flotation plant of the Goldfield Con. is treating upward of 700 tons per day and will soon be handling 1000. It is said the gold and copper recovery is highly satisfactory, being fully as good as with the 50-ton experimental plant. Developments on the 600 level of the Mohawk are exposing fair-grade ore, and on the 333 level of the Red Top-Laguna group stoping is proceeding in ore averaging over \$12. It is estimated the June net earnings were about \$40,000 and that July will record a substantial increase.

It is reported the Philadelphia owners of the Vernal mine are arranging to install a core drill and prospect the deep sections. The Vernal is situated in the Diamondfield portion of the district, adjoining the Goldfield Belmont. It has produced considerable shipping ore from above the 200 level and indications are stated to be favorable for persistence of the ore shoots to depth.

The Charles S. Sprague interests of Goldfield have taken under option the Kanrohat property in Jefferson canyon, north of Round Mountain. A large tonnage of ore is in the mine and on the dumps, and the property is equipped with a small mill. The ore is largely silver bearing and it is probable flotation will be employed. Work will be prosecuted under direction of J. K. Turner, consulting engineer of the Sprague Co.

Tonopah.

The Victor shaft of the Tonopah Extension has been repaired and is again the main working outlet of the property.

A heavy tonnage of good ore is coming from the lower levels and the mill is being worked up to capacity. Fifty stamps are dropping and the management expects to keep the future output at over 2200 tons per week. Developments are going on from the 850 level down to the 1540 workings, with the stopes in ore at all points. A particularly large amount of new work is being done on the 1200 level.

The Halifax Co. has completed arrangements to shut off the flow of hot water on the bottom level and is ready to resume driving of the crosscut, which is designed to intersect the big vein exposed in the 1200 workings. At the latter point drifting and raising in ore continues and a good tonnage is being extracted, the ore being of the same high grade as previously reported; 180 tons are crushed weekly at the West End mill.

The Tonopah Mining Co. has completed sinking a winze in the Mizpah Extension, which will be the 1345 level. A station is being cut at this point and considerable lateral work has been decided on. Stoping on the flat vein continues to expose 4 ft. of good ore. Small shipments are made as ore is broken in course of developments. The Tonopah Mining Co. has declined to exercise its option on the California-Tonopah group, following a comprehensive exploration of the workings.

Carlin.

An important development is reported from the Lynn Big Six mine, controlled by Salt Lake capitalists. A new ore body, 400 ft. from and paralleling the main ledge, has been opened and assays around \$46; 20 ins. of the face is said to run from \$115 to \$290.

Pioche.

High-grade silver-lead ore has been encountered in the property of the Pioche-Bristol Mining Co. The vein is about 3 ft. wide, of which 11 ins. averages \$550. There are also 24 ins. of good milling grade. Machinery is to be installed and sinking prosecuted. H. W. Parker is superintendent.

Battle Mountain.

Rehabilitation of the group of copper mines in Copper canyon recently acquired from the Glasgow & Western Co. by eastern capitalists has begun; two 50-h.p. gasoline engines have been purchased to operate the generator which delivers electric power to the pumps. Endeavors will be made to recover the main ore bodies on the 530 and 590 levels as soon as the water is out. Shipments of selected ore are being made from the old dumps. F. Sommer Schmidt is manager.

Gold Circle.

Los Angeles people are negotiating for the old Guzman mill with the intention of reconstructing it and converting it into a custom plant. Much custom ore is available and developments are hampered by lack of milling facilities.

Seven Troughs.

The north drift on the 1700 level of the Seven Troughs Coalition is now breaking about 8 ins. of \$700 ore. Since first encountered in the main winze the north drift has penetrated this ore shoot 25 ft., and about an equal distance to the south, where although good quartz is showing, the values are not as high. The new level is now officially designated as the 1700, although in previously referring to the strike on that level, it was called the 1660. The first bullion shipment of the month was made a few days ago. It amounted to \$10,000. A new direct-drive compressor of 395-ft. displacement from the Chicago Pneumatic Tool Co., just received at the mine, is being installed. This will practically double the air capacity and will greatly facilitate the exploration work.

Rochester.

The work of the past week has developed several excellent faces of ore in stopes in the north end workings of the Rochester Mines Co. In Raise 166 from the 320 in the East vein in Block 2 of the Crown Point, miners are breaking 7 ft. running around \$25. On the 250 in Block 3 the West vein shows 3½ ft. running \$20 to \$30. The East vein is showing equally well in this territory. All of these points are south of the strike reported in the extreme north workings of the East vein last week when at a point 250-ft. below the apex 2 ft. of ore was broken running \$154.70 in silver and \$5.20 in gold. Sinking has been resumed in the

Codd winze now at the 800 point below the apex of the East vein. The south drift on the West vein is still in ore and is approaching the Weaver ground of the company. Work has begun on foundations for new machinery about to be installed in the mill. The new equipment will double the capacity bringing the treatment rate around 200 tons per day.

Roach.

White Pine Mining Co. is building a cable aerial tramway, 2500 ft. long, to transport zinc ore from the mine to loading bins on a wagon road, over which there will be a haul of 7 miles. The ore runs 25 to 30% zinc, and is a sulphide. The plan was prepared by Otto Wartenweiler, Los Angeles.

Bruner.

The Kansas City-Nevada Con. Mines Co. property, located at Bruner, in the northwest corner of Nye county, is about ready for a ball mill. A good many hundred thousand dollars' worth of ore is now blocked out ready for the mill, and the prospects are very bright for the company.

NEW MEXICO.

Mogollon.

Recent development work on the Gold Eagle group by Louis Gramas has placed the property among the producers, the ore being shipped to local custom mill. The property is opened by shaft and tunnels and its location in the district is such as to give it a promising future.

Operations for last half of June by Socorro Mining & Milling Co. produced 18 bars of gold and silver bullion weighing about one ton; also several tons of high-grade concentrates. The plant treats 230 tons of ore daily.

At the Eberle mine, operated by the Oaks Co., preparations are being made for more extensive development work, including unwatering of main shaft. A good grade of mill ore is exposed in face of both north and south drifts from bottom of this shaft and will materially increase the production of this company.

The merchants and business men of Clifton are making a strong bid for the Mogollon business. It is said that from a survey down the Frisco river good road grades have been found. This route would give a haul to railroad of about 65 miles, instead of over 80 miles via Silver City, and would reduce freight charges in the neighborhood of \$5 per ton.

OREGON.

Grants Pass.

The evidence that Spaniards worked the gold deposits of southwest Oregon is now being well linked together. A recent discovery, in the sluice boxes of the Logan mine in the Illinois valley, of a Spanish coin bearing the date mark of 1784, is held to establish the approximate date of their operations. Besides this the cross of some Franciscan friars was found some years ago. They founded a mission at Monterey in 1770.

It has been rumored that certain financial interests are now endeavoring to reopen the Takilma smelter, which has been closed since 1908.

Grave Creek.

It is said that operations are picking up in this district and many farms have been leased for both prospecting and dredging operations. Among them are the farms of Kirk, Patton, Blalock and Williams.

Marshfield.

At Marshfield experiments conducted show black sand rich in platinum and gold. A recent shipment reports 85 lbs. having produced \$17 platinum and \$2.70 gold.

Sumpter.

The Blue Ribbon mine is arranging to start shipping to the Oregon-Idaho Investment Co. The ore will be hauled here by team and from here over the S. V. to Baker. The Blue Ribbon has been developed sufficient to disclose con-

siderable sacking ore. It is owned and operated by J. B. Tardiff, who expects to get out at least 100 tons of a high grade. Tardiff has devoted many years to developing the Blue Ribbon from a mere prospect.

Canyon City.

The dredge which is operating here has only recently been completed at a cost of about \$150,000.

Chrome iron has been discovered on Canyon mountain. It crops on the surface in a 50-ft. ledge, said to be the largest in United States. Zinc deposits are also being developed and many native copper specimens have been brought in. There is at present more interest in the mining activity here than for years. About 100 claims have been staked during the past few days and a number of mining men have been here. Some of the chrome iron has been sold right on the ground and the expectations are to haul it out this summer.

SOUTH DAKOTA.

Lead.

The Ofer Mining Co., formed in March, 1916, to take over property of the Dakota Mining Co., is now sending 100 tons of ore per day to the Mogul mill. The ore is being hoisted through the old Mogul shaft and is coming principally from the Monday ground, one of the former properties of the Dakota. There is also some production from the Apex claim. At the Monday the Dakota Co. left numerous pillars to support the ground and these are now being used as milling material. The ore is also being taken from the extensions of verticals, which were worked in the North lode of the Mogul property and produced a material part of the rock taken from that ground. The ore is not high grade, but it contains sufficient value to permit of its treatment. In addition to the verticals, Ofer has in sight a considerable quantity of flat formation ore, upon which it can rely for the future.

Maitland.

A. J. Simmons, general manager of the Echo Mining Co., says the new electric pump is working good and progress is being made in development. The crosscuts, which are being driven east and west from the 200 level of the main shaft, are now in about 200 ft. each. The shaft was started outside of the ore body, the intention being to sink in ground more easily broken and crosscut to the vein when a suitable depth had been reached, but the shaft dropped into ore at the 200 level. This remained in the east crosscut for a considerable distance. The west crosscut encountered another ledge at the expected point. Assay returns from the ore on the 200 level are materially higher than those from the ore which was prospected by tunnel work at higher levels.

UTAH.

Salt Lake.

The reorganization of the Western Pacific Railroad promises the building of a railroad into the Deep Creek district where there are a number of mines that with transportation facilities could be steady shippers. Plans for this road have been held in abeyance for several years until the road was properly financed. A special meeting of the Western Utah Copper Co. has been called this month at which the voting of 50,000 shares of treasury stock will be made towards the building of the road. The call is signed by Duncan MacVichie, a local mining engineer, H. H. Green, city commissioner of Salt Lake, Henry Hornblower, John W. Weeks and James J. Phelan of Hornblower & Weeks of Boston and J. A. Coran. It is understood several other companies will do the same thing.

From the Lucy L Mining Co. property in Deep Creek some tungsten ore is being mined. This ground also carried bismuth and gold.

Ore has been encountered in the lowest tunnel at the O. K. Silver property in Deep Creek. This gives a depth of about 500 ft. on the ore body. A winze below this level for

several feet is also in ore. This gives promise of continuing to considerable depth in ore. The ore is exceptionally rich in silver and shipments have been made that carried over \$5000 a car.

Eureka.

Mrs. R. S. Robertson of Salt Lake has started work on the Victoria Gold Mining Co. property in North Tintic. The old shaft has been retimbered and work has been started in the dolomite lime on the 450 level. Within the next few weeks the drift should be under a large iron blow-out where ore is expected. Mrs. Robertson is also owner of the Highland Mary group in the same section.

Preparations are being made to start operations on the old Bradley group in North Tintic under the direction of R. A. Brown, former superintendent of the Centennial Eureka. The property was once under option to the Eagle & Blue Bell.

The Chief Con. is making a record in shaft sinking on its new holdings at Homansville. Walter Fitch, Jr., has a contract for the work. The first 5 days the shaft went down at the rate of 10 ft. a day.

The machinery for the Lehi Tintic property in North Tintic is beginning to arrive and being installed.

The first shipment of ore from the property of the Desert Mountain Mines Co. in West Tintic has just been sent to market. General Manager Jake Turner expects the property will be able to ship about 2 cars of ore a week. The ore is hoisted by a whim from a 130-ft. shaft, and carries sufficient copper to stand an 18-mile haul. The Lucky Shepherd in the same district has just made its first shipment.

Andrew P. Madsen in charge of the Tintic Delamar in North Tintic says that some interesting development work is being done at the bottom of a winze 100 ft. below the tunnel level and at a vertical depth of 250 ft. There has been 450 ft. of drifting and 165 ft. of sinking on the property. Some of the quartz has carried as high as \$145 in gold.

The Eagle & Blue Bell shipments have been cut down from 150 to 50 tons a day and Supt. William Owens has put most of the 70 men on development work. The shaft is being sunk to the 1850 level and is now 65 ft. below the 1700. On the 1000 and the 1300 levels drifts are being driven into the Victoria ground. New development drifts are being run on the 1300 and 1500 levels. The present tonnage is coming from the 1500 and 1700, although there are large quantities of ore exposed on almost every level in the mine.

June earnings for Iron Blossom were \$35,000. A dividend of 10 cts. a share has been posted, payable July 25 to stockholders of record the 15th.

Ophir.

A car of ore which has been shipped from the St. Clair lease on the Lion Hill property brought \$2876.59 net from the smelter. There are 2 more cars of about the same grade that will be marketed shortly. The ore averaged 0.13 oz. gold, 50 ozs. silver, 37.2% lead and 10% iron. This is the deepest at which ore has been mined in the property at a vertical depth of 300 ft. There are two shoots of ore and they are going down strong.

The Trace tunnel on the Banner Mining Co.'s ground is being pushed ahead with two shifts. The tunnel is now in 200 ft. Within the next 80 to 100 ft. it is expected the Banner fissure will be encountered. Four hundred feet ahead of the present face of the tunnel the old workings on the Lion Hill will be reached. This will be 300 ft. below where nearly \$1,500,000 was taken out within 125 ft. of the surface.

Park City.

Within the next 10 days the Big Four mills will be in operation handling daily 750 tons of tailings. This mill will make a lead and a zinc product.

The output of ore from Park City for June amounted to 206 cars, 122 being shipped over the Denver & Rio Grande and 84 over the Union Pacific. The cars aggregated 8714 tons. The shippers were: Silver King Coalition, 2379 tons; Federal Leasing Co., Ontario, 323; Ontario Silver Mining Co., 1207; New Quincy, 124; Daly West, 1001; Silver King Con., 107; Daly Mining Co., 142; Judge Smelting & Mining

Co., 1724; Park City Mines Co., 7; Charles Moore, 34; Western Ore Co., 118; American Flag, 83; E. J. Beggs, 99; Broadwater Mills, 158.

The Daly West mill is now in operation handling 150 tons a day and regular shipments of crude ore are also being made. The company is making good earnings for the first time in several years and is fast paying off its indebtedness.

The curtailment of shipments ordered by the smelters has cut off shipments almost entirely at the Ontario. The company is taking advantage of this to push development work on the 1700 level where there was considerable good ore left standing in the early days.

Bingham.

Another new record has been made in loading ore by the Utah Copper. On the 6th, 43,000 tons were loaded at the mine. During the day 653 ore cars were filled. The company is now handling about 75,000 tons of ore and waste a day.

The old Yampa mine, owned by the Tintic Mining & Development Co., is employing 150 men and shipping at the rate of 200 tons a day. The company has now opened up the mine to the 1600 level where new ore bodies have been opened up on the lime-quartzite contact. This ore carries from 3 to 4% copper and a fine excess in iron that makes a good smelting product which is going to the Garfield smelter.

Lincoln.

The drift from the 150 level at the Croff has opened up ore 30 ft. from the shaft. This is one of the ore bodies that showed good in the levels above.

At the Creole mine, which is under lease to Dern & Griggs, high-grade ore has been struck to the northwest in a drift from the winze below the lowest level from the shaft. Samples of the ore showed 21.2% iron, 14.6% copper, 9.2 ozs. silver and \$3.60 gold. The lesses are shipping about 15 cars a month and since the lease started have sent out 2000 tons.

Alta.

South Hecla has posted its initial dividend of 15 cts., payable Aug. 10 to stockholders of record July 31. The company has 202,000 shares issued of a par value of \$1. The dividend amounts to \$39,300.

The Michigan Utah is making preparations to ship on company account from the Copper Prince tunnel where 18 ins. of copper ore carrying \$30 values has been opened up for 100 ft. The Triangle lease on the property will shortly be shipping at the rate of 2 car loads a day.

The machinery is being connected up for the long drain tunnel at the Wasatch Mines property. The grading has all been done and three shifts will be at work shortly.

A ventilation pipe and suction fan are being put in at the Alta Tunnel & Transportation Co.'s long tunnel. As soon as this is finished three shifts will be put to work. The tunnel is now in better than 2000 ft. The ultimate length of the tunnel will be 4000 ft.

The Emma Copper Co. and the Old Emma have united in prospecting with a diamond drill from the Bay State tunnel. The Emma Copper Co.'s geologist has figured that the faulted ore body should be encountered with 200 ft. of drilling.

As soon as the new ore bins are finished the Cardiff will begin shipping 300 tons of ore a day as compared with 100 now. James Austin and Abe Meekin have just received five caterpillar tractors and 60 trailers that will be used for the hauling of ore.

American Fork.

Four feet of ore in the Pacific in which a stope is being made shows average values of 3% copper and 8 ozs. silver. In doing this work there has already been taken out 2 car loads of ore.

Three shifts are now at work on the Copper Glance property which was recently incorporated. The ground adjoins the Pacific mine on the north and has the extension of the ore body. The tunnel is now in 40 ft. and it is expected that the fissure will be encountered at a distance of 400 or 500 ft.

The recent strike at the Belorophan property shows several feet of milling ore that will average \$1.10 gold, 11.2 ozs. silver, 2.1% lead, and 0.65% copper. There is also a 12 to

14-in. streak of ore that carries \$4.20 gold, 39.95 ozs. silver, and 38.90% lead. A drift from the tunnel level is now being extended into the mountain and along the strike of the vein. This is showing better ore. A raise is also being made to the surface in the vein so as to get better ventilation, and prospect some lime beds.

A foot of ore carrying \$100 in values has just been opened up in a 30-ft. tunnel on the Gold Hills Mines property in the western part of the district. The ore carries values in copper, silver and lead.

Grading is being done for the mill for the Pacific and Dutchman properties which it is expected will be completed within 60 days.

Control of the Alpine Empire property has been purchased by Jesse Knight.

WASHINGTON.

Spokane.

Shipments have been begun from the Electric Point mine, near Northport, and 30 horses and a motor truck now are employed hauling to the railway at Boundary, according to Roy A. Young, president of the Electric Point Mining Co., in which Walter Nicholls, Thaddeus S. Lane and other Spokane men are heavily interested. The ore bins at Boundary already are filled, and the railway company is constructing a siding to them. "We have not definitely decided where we will ship our ore, but we will have settled this point by the time the railway company can get cars into our bins," said Young, "and in the interval we will load directly from the ore wagons. We shall keep adding teams as rapidly as the new road from the mine to Boundary permits of heavier traffic, and in the next week or so we hope to be producing at capacity. We have a good offer for our entire output for one year from the Trail smelter and offers from Joplin, Mo., for all our galena ore, and from the Northport smelter for all our carbonate ore. The Trail plant is the only one offering to take our entire output irrespective of grade with no other provision but that we shall endeavor to keep the galena ore separate from the carbonate ore and average our shipments at 100 tons daily. The settlement basis of the proposed contract is the New York price of both lead and silver. The development of the No. 2 ore chimney has proved its ore contents to be much richer than those of the first chimney we discovered. This is because of the presence of crystallized lead in great abundance throughout the carbonate ore body. We are now about 40 ft. from the point where we expect to tap the No. 3 ore chimney by the drift on the 225 level, the same on which we opened up our No. 2 chimney. The No. 3 chimney appears to be much the largest so far found. The drift toward it is following a stringer of ore which has averaged 10 ins. in width all the way, but which occasionally widens out into a lens, or pocket. From the last of these pockets which we encountered we took out a ton of clean galena."

WISCONSIN-ILLINOIS.

Highland.

The New Jersey Zinc Co., after remodelling a \$35,000 plant, has resumed operations at the Red Jacket mine, in the Centerville camp, and the first shipment of 1 car of carbonate zinc ore was made to smelter at DePue last week. Six cars of carbonate and complex ores were also delivered from company mines. A 200-ton concentrator is being completed on new strikes known as the Kennedy-Eberle mine.

Buyers of carbonate zinc ore—Lanyon Zinc Co. and Eagle-Picher Lead Co.—took a car each, while the New Jersey Zinc Co. shipped 2 cars from the Highland mine last week. Considerable ore is held in reserve in this district.

Linden.

The Linden Zinc Co. shipped 3 cars finished product last week to Eagle-Picher Lead Co., Collinsville, Ill., 120 tons. The only other shipper was the Saxe-Pollard Co., 3 cars to

separators; 2500 tons of crude concentrates is held in reserve here.

Mineral Point.

Receipts of ore for week ending the 15th at the ore refineries of the New Jersey Zinc Co. totaled 27 cars, 977 tons, about half of the tonnage usually received. Shipments of high-grade finished ore to smelter at DePue, 21 cars, 745 tons.

Service is being extended from the Mineral Point Public Service Co. to Richland Center, Wis., 55 miles north.

Receipts of raw ore ran high at the Mineral Point Zinc Co.'s works for week of June 24—46 cars, 1753 tons. Refined ore to smelter at DePue, 18 cars, 1,372,000 lbs.

Platteville.

Returns for the field for week of 15th show 116 cars of zinc ore delivered to track, 4542 tons. Lead ore 2 cars at Federal Lead Co., 130,000 lbs.; pyrites to General Chemical Co., 966,300 lbs. The gross recovery mine run for the week, 3391 tons, shows a considerable curtailment of output due to a steadily declining ore market. Net shipment of high-grade refinery product to smelter and mine run ore to smelter direct for the week, 2745 tons.

The market was off about \$5 per ton over the figures of previous week, \$60 to \$65 base 60% zinc content, and top grade ore down to \$53 for medium grades, assaying down to 50% zinc. These figures leave low grades without a market. A conservative estimate of concentrate held in bin falls not far short of 10,000 tons.

Mifflin district shipped 13 cars last week, 532 tons; Mineral Point locals to furnace, small lots, 21 tons; Dodgeville, Montfort, Hazel Green and Potosi districts reported no shipments.

Mifflin.

The Grunow, handling 75 tons of mill feed daily, is making 8 tons of concentrates which is held. Peni Mining Co. has 100 tons of high-grade ore on hand. The B. M. & B. Mining Co. has opened up the old Squirrel mine with a fine showing. The Biddick shipped 14 cars in June, but shipments at present are light; 7 cars of ore is held in bin. The Lucky Six is running an average of 150 tons of mill rock daily and is making 10 tons of high-grade ore. Rewey business men have purchased the Phoenix mine and will supply a milling plant. The Coker No. 1 is treating 300 tons daily and recovering 25 tons of concentrates. Shipments for June totaled 18 cars. Coker No. 2 is handling 350 tons daily and recovering 15 tons of concentrates; 9 cars were shipped in June. The Rundell is holding about 150 tons of ore. The main forehead is carrying over the line into the Yewdall lease where a new shaft is down to ore level and another mill will be built without delay. The Big Tom is in running order with a new rig being tried out this week. The mine has been unwatered. Livingston mining men assumed control of the O. K., equipped the property and now have an ore run 70 ft. wide and still undetermined. The ore is high grade. The Senator is going steadily and shows two working faces, one driving east 80 ft. wide and another driving west 70 ft. wide. Several hundred tons of concentrates are held in bin. Drills are at work on six leases in camp.

Last week's deliveries were: Lucky Six, 4 cars, 124 tons; Coker mines, 7 cars, 282 tons; all to Mineral Point Zinc Co. Rundell to Cuba, 43 tons; Biddick to Benton Roaster Co., 2 cars, 91 tons; Senator to Galena, 42 tons. A new shaft is going down on the Udell lease of the Vinegar Hill Co. Mineral Point to furnace, small lots, 8 tons in all. O. P. David at Montfort is going steadily; shipped 2 cars to LaSalle, Ill.

Benton.

Shipments have been appreciably lessened since the recent slump in ore values. Last week's reports account for 45 cars of zinc ore, 1800 tons. The Vinegar Hill Co. led with 9 cars from the Martin, Kittoe & Blackstone; Frontier Co., Burr mine, 3 cars; Hird, 2 cars, and Bull Moose 3 cars, 326 tons. The Hird is a new producer. New Jersey Zinc Co., Fox mine, 5 cars, 218 tons. Fields Crawhall mine to Wisconsin Zinc Roasters, 3 cars, 105 tons; to Galena Refining Co., 4 cars, 120 tons; Fields Thompson mine to Galena Refining Co., 2 cars, 80 tons; Wilkinson Mining Co. reports an initial shipment of 1 car to Mineral Point, 42 tons; Skinner Separat-

ing Works, New Diggings, to LaSalle, 1 car, 41 tons; American Zinc Co., 4 cars, 150 tons, to Edgar Zinc Co., 3 cars, 120 tons, all high-grade ore. The Champion mine delivered 5 cars mine run to Wisconsin Zinc Roasters, Galena, 200 tons.

Cuba City.

The National Separating Works received 16 cars zinc ore last week, 691 tons; shipments of finished product to Illinois Zinc Co. 5 cars, 185 tons; Granby Mining & Smelting Co., 7 cars, 286 tons; Utt-Thorne Co., to Benton Roasters, 2 cars, 88 tons. Standard Metals Co. is rushing reconstruction of a second-hand plant on the Gritty Six mine; is supplying a pumping and power station to the old Dall mine. Baxter Mining Co. resumed operations on the old Baxter.

Shullsburg.

Shipments of zinc concentrates to Wisconsin Zinc Roasters from the Winskill mine continues in volume, 5 cars going last week, 200 tons. Rodhams Mining Co. is producing heavily both of lead ore and zinc ore. A new producer, including independent zinc ore refinery, boarding house and miners' cottages, is in operating order on the Mulcahy land for the Oliver Mining Co., a subsidiary of the Cleveland-Cliffs interests. T. Hawson is superintendent in charge. A score of drill rigs are engaged in prospect work at as many different points in this district.

Galena.

Shipments for week of 15th showed improvement, 4 cars coming from the Black-Jack mine, 152 tons; Galena Refinery Co. to American Zinc Co., 1 car, 30 tons; to Lanyon Zinc Co., 3 cars, 100 tons, all high grade; Federal Mining Co. to Wisconsin Zinc Roasters, 1 car, 40 tons; North Unity to Cuba, 3 cars, 131 tons; Wisconsin Zinc Roasters, 61% ore to LaSalle, 40 tons; to American Zinc Co., 2 cars, 80 tons. New producers are going on trial runs this week satisfactory in all details. The Birkbeck, Graham, Little Corporal, Dinsdale and others being in the list of new entries. Under more favorable conditions reports would be forthcoming on shipments. All have ore in bin ready for bids.

WYOMING.

Cheyenne.

The Pilot Petroleum Co. has filed papers here as a \$2,000,000 company. It has organized for the purpose of developing oil lands in Fremont county, with head offices at Riverton. Ex-Governor Fenimore Chatterton is president; W. R. Weeks, secretary, and these, with John Dillon, W. S. Adams and Ralph Kimball, form the directorate. The company has about 1400 acres of land in the Pilot Dome field, and will begin drilling immediately.

Cody.

James Murray of the Flathead Oil Co. says: "We have a standard rig, 4½ Pennsylvania type, on the way from the factory, which will be installed as soon as it arrives, either near here or at Salt Creek, both of which are big producing fields. A contract to sink a well with this rig to a depth of 1000 ft. if necessary has been let to A. Cannady of Tenino and he has instructions to get a well down with all possible speed. The work will be under the direction of the company's engineer and geologist, Ferry Lens. He has made a close study of the fields in which our drilling operations will be carried on. He informs us that there are three oil-bearing sands in the Cody field. The first is found at an average depth of 400 ft.; the second is usually encountered between 800 and 1000 ft. and 1500 ft. down."

CANADA.

BRITISH COLUMBIA.

Trail.

Receipts of ore the first week of July at the Trail smelter showed a considerable falling off in tonnage, especially from the Sullivan mine in East Kootenai, due to

interruption to the railroad service by floods. During the first 7 days of the month only one new shipper was added to the list—the Ottawa mine near Slocan City. Following is a tonnage of ore receipts for the week, with the totals furnished by the same shippers for the year to date:

Mine.	Week.	Year.
Center Star, Rossland.....	3,253	97,171
Le Roi, Rossland.....	2,409	72,989
Le Roi No. 2, Rossland.....	174	8,421
Sullivan, Kimberley.....	33	36,871
San Poil, Republic, Wash.....	545	5,964
Knob Hill, Republic, Wash.....	122	1,699
Rambler-Cariboo, Slocan.....	43	949
Silver Standard, Hazelton.....	32	289
Ottawa, Slocan City.....	43	43
Eureka, Nelson.....	114	623
Standard, Silverton.....	67	3,788
Galena Farm, Silverton.....	42	635
United Copper, Chewelah.....	119	5,126
Bluebell, Alnsworth.....	61	3,522
Other mines.....	14,732
Totals.....	7,057	252,867

Nelson.

Plans for the further development of the Granite-Poorman mine include the driving immediately of a crosscut tunnel to connect the Poorman workings with the Hardscrabble vein. This crosscut should be about 475 ft. in length and should give an increased depth on the Hardscrabble vein of about 200 ft. It is from the Hardscrabble vein, which was developed by a shaft put down by the Nelson syndicate last winter, that rich ore is being secured to put through the mill. F. H. Skeels, manager, proposes to keep the 20-stamp mill in operation during the development work. Improvements are to be made to the mill.

Revelstoke.

Large ore bodies, carrying good values in gray copper and galena, are reported to have been opened up in the old Lanark mine by W. B. Dornberg of Spokane, who purchased the property about 2 years ago from the Horne-Payne Co., which formerly controlled it. To date this year the mine has shipped 371 tons of ore to the Trail smelter and arrangements are being made for a larger output. Dornberg last fall constructed a tramway to connect the mine with the Canadian Pacific railway, a distance of about a mile. Another property in this district in which Spokane men are interested is the Donald at Albert canyon. Reeves Bros. of Spokane are associated with David Woolsey in its operation. Woolsey states a new 7-ft. vein of ore, carrying good values in silver, has been discovered. It is proposed to connect the mine with the Canadian Pacific railway by a 2-mile aerial tramway.

If the French Complex Ore Reduction Co. can secure the necessary electrical machinery it should be turning out refined zinc at its Nelson plant within 2 months. Thomas French, manager, has announced that the \$40,000 worth of bonds which had been guaranteed by the provincial government to aid in the establishment of the industry had been sold at 97. Interest payable is 5%. The proceeds of the bonds are now in the bank at Victoria and will be released to the company in payment for construction work by the minister of finance as the work proceeds. French has gone to Victoria to make the final arrangements for commencing work and construction will commence immediately after his return. The company will treat complex zinc ores by an electrolytic process which has proved successful under experiments. It has secured a power rate of ¼-ct. a kw. from the city of Nelson. French expects to get an extraction of 90% of the zinc contents. Lead and silver contents will also be saved.

Salmo.

That the Hudson Bay zinc mine, in the Sheep creek district, is destined to become an important producer is the belief of W. E. Cullen of Spokane, treasurer of the Hudson Bay Zinc Mines Co., recently organized to take over and develop the property. "In our main tunnel we have opened an ore body 15 to 60 ft. wide for a distance of several hundred feet. On the lower level we have drifted on the same shoot for 700 ft., and the conditions lead us to believe that it is not less than 2000 ft. long. Our new crosscut tunnel, which will tap the ledge at a depth of 700 ft. below the outcrop, and almost directly under the center of our present

workings, is being advanced at the rate of 12 ft. daily, and should reach the vein some time next month. We expect that it will tap the ledge below the zone of oxidation. We are shipping continuously from development work an average of 50 tons daily of 30% carbonate ore. If the ore disclosures on the 700-ft. level prove to be satisfactory, the company will drive a third tunnel to tap the ledge at a depth of 1700 ft., erect a large concentrator at the tunnel mouth and construct a railroad from the mill to Salmo, a distance of 8 miles, where connection will be made with the Great Northern system."

Silverton.

The net earnings of the Standard Silver-Lead Mining Co. were but \$38,436 in May, or \$11,564 less than the month's dividend requirements, according to operating report for the period, issued by Charles Hussey of Spokane, secretary-treasurer. Regardless of this, however, the company undoubtedly will continue to make monthly disbursements at the rate of 2½ cts., or \$50,000. The net profits in April were \$86,773, and in March \$136,943, making the earnings for the 3 months \$223,716, while the dividend payments for the same period were but \$150,000, leaving a surplus for the 90 days of \$70,716. The financial statement shows a balance of \$309,373 on May 31, as compared with \$320,936 on April 30 and \$284,163 on March 31.

The net earnings of the Galena Farm Mining Co., which owns and operates the Galena Farm mine and mill, near here, were \$40,000 in May, according to James J. Stewart of New York, one of the principal stockholders in the corporation, who inspected the property recently. The mine recently was equipped with a 100-ton mill, and production now averages 35 tons of concentrates daily, the output running high in lead and zinc. The vein from which ore now is being extracted is 14 ft. wide, and it is said that development has revealed reserves sufficient to operate the property at capacity for the next 5 years. Shipments in May aggregated 759 tons of concentrates that averaged 46.5% zinc and 20 ozs. silver, which netted about \$25 a ton, and 237 tons of concentrates averaging 67.3% lead and 66.1 ozs. silver, netting \$125 a ton.

Three Forks.

June shipments of the Rambler-Cariboo Mining Co. were 30 tons of lead ore, 160 tons of lead concentrates and 60 tons of zinc concentrates, according to a report of Supt. Cameron. The gross profit from the lead product was approximately \$17,000, and the net earnings about the same as in May, or \$11,000, leaving the zinc output for the 2 months still on hand, difficulty having been experienced marketing it. "In the present condition of the spelter market our zinc concentrates are not particularly attractive to the smelters, owing to their low grade and the excess of iron content," said A. F. McClaine, president. "To work them into a desirable product we are arranging with the management of the new custom mill at Kaslo for their treatment, and we hope soon to have a large tonnage of these re-milled concentrates in good merchantable condition. We have not been crediting any part of our earnings from zinc to any particular month because we have not been shipping our product at a uniform rate. A short time ago we realized \$11,000 from the sale of zinc concentrates, but we did not credit it to the earnings that month, as we figured it should have been spread over two or three. We shall probably market another lot in the same way soon."

Zincton.

The Lucky Jim Zinc Mines shipped 460 tons of concentrates and 70 tons of crude ore in May, according to the report of Andrew G. Larson of Spokane, trustee in bankruptcy for the corporation, filed recently with the registrar of British Columbia. The net smelter returns for the period were \$15,673 and operating expenses were \$6640, leaving a surplus for the month of \$9033. Operations for June and July according to estimate will net approximately the same. It is anticipated that the new custom concentrating plant at Kaslo, being constructed by M. S. Davys, one of the owners of the Hewitt mine, will be ready to operate soon. It will handle Lucky Jim ore exclusively, and it is expected that it will be able to treat a tonnage equal to that now being milled at the Roseberry concentrator. The Kaslo plant is

being equipped with electric separator and flotation process and is consequently depended on to produce a fine grade of concentrates. Arrangements are being made to improve the Roseberry mill by the addition of similar equipment, which will permit of the retreatment there on the large tonnage of middlings already accumulated at that plant. Beginning with August the output of the Lucky Jim will be doubled and possibly even more largely increased. Developments of late in the mine have been most encouraging and have resulted in enabling a resumption of shipments of crude ore which, the present indications are, will be maintained indefinitely. The winze from the No. 5 level and the main workings both are showing a marked improvement in the size and character of the ore bodies. The appointment of a receiver for the mine was brought about by the holders of two mortgages aggregating \$75,000. Receiver Larson has paid into court \$20,000 in all to apply on the reduction of these mortgages and now has on hand \$10,000 more, which will be applied to the same object. Aside from its mortgage indebtedness nothing is known as to the financial obligations or standing of the Lucky Jim company.

ONTARIO.

Porcupine.

Production at the Dome Mines Co.'s properties fell off during June because of some changes in both mines and mill. A much greater production is anticipated in July. It is expected that a steady increase will be made until the five Hardinge ball mills are in operation. During June 36,700 tons of ore were treated of a gross value of \$179,000, or \$4.88 per ton. Average values showed an increase of 9 cts. above May. The average value of ore treated in April was \$4.75, in March \$5.05, in February \$5.10 and in January \$5.58. Costs showed an increase to \$2.62, due to extra cost of chemicals and the big development and exploration work being carried on. This compares with \$2.46 in May and \$2.41 in April. The problem at the Dome is no longer one of ore reserves, but rather of milling capacity. Excepting times when changes are being made, such as during last month, the tonnage has been steadily increasing, showing the activity of the company and giving an inkling of what may be expected when the present program of mill addition is carried out.

Kirkland Lake.

Beaver Con. has met with some success at the McKane mine, according to president F. L. Culver. The shaft has reached a depth of 200 ft. and stations have been cut at the 100 and 200 levels. On the first level sinking was continuously in ore for 115 ft. Channel assays running as high as \$112, while assays from vein samples show values of nearly \$400. At the present time a crosscut is being driven on the 200 level to prove the vein at this depth. Development shows 115 ft. of sinking, 278 ft. of crosscutting and 208 ft. of drifting.

Cobalt.

The old Red Jacket mine is now under the supervision of Frank Hatch. It has been pumped out and is now receiving power from the hydraulic air line passing nearby. On one vein there is a good showing of nickelite and smaltite. Some good assays of silver have been obtained, both from the vein matter and dump. The shaft is down 120 ft. and there is about 600 ft. of drifting. Near the end of this drift a pocket of silver ore was cut into before closing down several years ago. The conglomerate at this point is 260 ft. in depth. With good showings at 120 ft. it is believed that along the contact should be a promising place to carry on exploration. A winze will probably be sunk from the 120 level to this contact.

The Hudson Bay Mines, Ltd., now has two shifts and six drills working. On the 300 and 400 levels of the No. 3 vein it has run into high grade, running from 7000 to 8000 ozs. silver. Considerable of this ore has been bagged. It is the intention to start stoping on this and the No. 2 vein at once. Repairs on the mill are being rapidly rushed to completion. Particular attention will be paid to an oil flotation unit, which will be installed, and it is very probable that the company will adopt this process for the treatment of all the ore, including the tailings.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Diekman, P.—*Chemistry of Portland Cement*. [Abst. from the Jnl. of the American Soc. of Mechanical Engineers].—Met. & Chem. Engg. July 1 1916; p 41; pp 1½; 30c.

Clays, Ceramics

Greaves-Walker, A. F.—*The Path to Success in Operating a Continuous Coal-Fired Tunnel Kiln*.—B. & C. Rec. July 4 1916; p 27; pp 2½*; 35c.

Concrete

Sherwin, R. A.—*Forms for Concrete Work*. [Abst. of a paper read before the American Concrete Inst.].—Western Engg. July 1916; p 261; pp 6¾; 20c.

— *Coal Miners' Pocketbook*. [Gives rules, principles, formulas and tables].—McGraw-Hill Co.; book; pp 1172*; \$4.

Lime

Smith, E. B.—*Efficiency of Shaking Grates as Applied to Lime Kilns*. [Details and drawings bringing out the use of this grate are given].—National Lime Mfg. Assn. Bull. 10; pp 10*.

(C) OTHER NON-METALS**Abrasives**

Katz, F. J.—*Abrasive Materials in 1915*. [Each material is reviewed separately].—Min. Res. of U. S. II:10; pp 16.

Feldspar

Katz, F. J.—*Feldspar in 1915*. [Reviews the occurrence and nature of the mineral with methods of mining and refining and statistics on its production].—Min. Res. of U. S. II:7; pp 11.

Graphite

Bastin, E. S.—*Graphite in 1915*. [The market conditions and U. S. in general are first reviewed and followed by separate reviews of the industry in each state].—Min. Res. of U. S. II:11; pp 13.

Magnesite

Mudd, S. W.—*Mining and Metallurgical Progress in the Southwest*. [Address delivered before the Chamber of Mines and Oil, Los Angeles, being on the production of ores and metals].—Mg. World July 1 1916; p 11; pp 2; 10c.

Soapstone

Diller, J. S.—*Talc and Soapstone in 1915*. [Each is taken separately in general for U. S. Both prices and production are given].—Min. Res. of U. S. II:9; pp 4.

Talc

Diller, J. S.—*Talc and Soapstone in 1915*. [Each is taken separately in general for U. S. Both prices and production are given].—Min. Res. of U. S. II:9; pp 4.

III. TECHNOLOGY**MINES AND MINING****Surveying and Drafting**

Marshall, R. B.—*Spirit Levelling in West Virginia*. [Specific data on level lines run datum plains, and bench marks in the state].—U. S. G. S. Bull. 632; pp 168; 20c.

Marshall, R. B.—*Triangulation in Arizona and New Mexico*. [Gives specific data for the location and survey computations from stations established by the U. S. G. S.].—U. S. G. S. Bulletin 611-B; pp 12*.

— *Coal Miners' Pocketbook*. [Gives rules, principles, formulas and tables].—McGraw-Hill Co.; book; pp 1172*; \$4.

Drilling and Boring

Sale, A. J.—*Drilling and Analysis of Copper Ores*. [A general discussion of errors made from taking average of churn-drill hole samples. Also speaks of the sulpho-cyanide assay of copper].—E. & M. J. July 8 1916; p 87; pp 3¼; 25c.

Taylor, W. G.—*Oil Well Motor Equipment*. [A paper read before the American Inst. of Elect. Eng. Gives the electrical power and equipment needed in drilling an oil well].—Jnl. of Elect. Power & Gas July 1 1916; p 6; pp 2½*; 35c.

— *New Safety Method for Drilling Tools*. [These tools have recently been invented with the idea of helping to prevent their loss in the hole].—Petro. World July 1916; p 313; pp 2*; 35c.

Explosives and Blasting

Higgins, E.—*Accidents from Mishfires and How to Prevent Them*. [Many causes of mishfires are taken up, important among which is the making of the primer].—Mg. World July 1 1916; p 17; pp 1*; 10c.

Moore, H. W.—*Blasting Practice at Chuquicamata, Chile*. [A system of electric blasting. Tunnels are made and loaded with powder for the blasting of large blocks of ground].—M. & S. P. July 8 1916; p 60; pp 2*; 20c.

— *Coal Miners' Pocketbook*. [Gives rules, principles, formulas and tables].—McGraw-Hill Co.; book; pp 1172*; \$4.

Mine Water

Scott, W. A.—*The Old Dominion Copper Co.'s Operations, Arizona*. [The questions of hoisting, mine waters and concentration by flotation are dealt with].—Mg. World July 8 1916; p 43; pp 2¾*; 10c.

Ventilation

Crankshaw, H. M.—*Modern Methods of Mining and Ventilating Thick Pitching Beds*. [Confined to coal deposits. Details and drawings of the methods are shown].—Bull. A. I. M. E. July 1916; p 1159; pp 11*; 35c.

Johnson, Moses.—*Ventilating Mines When Tipples Are on Fire*. [Diagrams are given to illustrate the methods].—Bull. Canadian Mg. Inst. July 1916; p 655; pp 7*; 35c.

Shaw, Wm.—*Coal Dust, How It Affects the Mines in Crowsnest Pass*. [Speaks of the peculiarities of coal dust in this mine and methods employed to cope with it].—Bull. Canadian Mg. Inst. July 1916; p 617; pp 8; 35c.

— *Coal Miners' Pocketbook*. [Gives rules, principles, formulas and tables].—McGraw-Hill Co.; book; pp 1172*; \$4.

Supports: Timbers, Props, Stowing

Crankshaw, H. M.—*Modern Methods of Mining and Ventilating Thick Pitching Beds*. [Confined to coal deposits. Details and drawings of the methods are shown].—Bull. A. I. M. E. July 1916; p 1159; pp 11*; 35c.

Dewell, H. D.—*Timber Framing*. [Speaks of the strength of timbers according to the direction of the stress with respect to the wood fibers].—Western Engg. July 1916; p 251; pp 6*; 20c.

Wilson, P. D.—*Stoping in the Calumet & Arizona Mines, Bisbee, Arizona*. [Gives detail of procedure for systems used as square-setting, top-slicing, caving systems, etc.].—Bull. A. I. M. E. July 1916; p 1099; pp 19*; 35c.

Hoists and Hoisting

Scott, W. A.—*The Old Dominion Copper Co.'s Operations, Arizona*. [The questions of hoisting, mine waters, and concentration by flotation are dealt with].—Mg. World July 8 1916; p 43; pp 2¾*; 10c.

— *Coal Miners' Pocketbook*.

[Gives rules, principles, formulas and tables].—McGraw-Hill Co.; book; pp 1172*; \$4.

— *Prices of Machinery for Mines*. [The average prices for mine equipment are plotted in curves for separate classes of machinery, according to the size and capacity].—Coal Age July 1 1916; p 22; pp 3*; 20c.

Mine Sampling

Sale, A. J.—*Drilling and Analysis of Copper Ores*. [A general discussion of errors made from taking averages of churn-drill hole samples. Also speaks of the sulpho-cyanide assay of copper].—E. & M. J. July 8 1916; p 87; pp 3¼; 25c.

Lighting

— *Costs of Operating Electric Cap Lamps*.—Coal Age July 1 1916; p 17; pp ¾; 20c.

Transport

McBride, W. G.—*Motor Truck Operation at Mammoth Collins Mine, Shultz, Arizona*. [Some costs of operation are given].—Bull. A. I. M. E. July 1916; p 1253; pp 4; 35c. Abst. in M. & S. P. July 8 1916; p 45; pp 2; 20c.

Trautshold, R.—*The Economics of Material Handling in Manufacturing Plants*. [Treats more directly with cranes and other plants and equipment for loading boats and cars].—Engg. Mag. July 1916; p 528; pp 9*; 35c.

Haulage and Conveying

Baker, H. W.—*Aerial Tramway Locked by Windstorm*. [An account of the tramway construction and the accident which occurred to it during a windstorm].—E. & M. J. July 8 1916; p 91; pp 1½*; 25c.

— *Coal Miners' Pocketbook*. [Gives rules, principle, formulas and tables].—McGraw-Hill Co.; book; pp 1172*; \$4.

Accidents

Baker, H. W.—*Aerial Tramway Locked by Windstorm*. [An account of the tramway construction and the accident which occurred to it during a windstorm].—E. & M. J. July 8 1916; p 91; pp 1½*; 25c.

Fay, A. H.—*Coal Mine Fatalities in the United States, 1870-1914*. [Also contains statistics on coal production, labor and mining methods by states and calendar years].—U. S. Bur. of Mines; Bull. 115; pp 366; 50c.

Higgins, E.—*Accidents from Mishfires and How to Prevent Them*. [Many causes of mishfires are taken up, important among which is the making of the primer].—Mg. World July 1 1916; p 17; pp 1*; 10c.

Safety

Higgins, W. C.—*List of Sketches of Safety Devices*.—Mg. World July 8 1916; p 16; pp 1; 10c.

Manning, Van H.—*Hazards to Men Increase as Mines Become Larger and Employ More Men*. [A paper read before the meeting of operators and inspectors at Harrisburg, Pa.].—Coal Tr. Bull. July 1 1916; p 43; pp 4; 25c.

Labor and Management

Alderson, Matt. W.—*Mining Possibilities in Colombia, South America*. [The fourth article of a series reviewing the country, its people and customs].—Mg. World July 8 1916; p 51; pp 4*; 10c.

Fay, A. H.—*Coal Mine Fatalities in the United States, 1870-1914*. [Also contains

statistics on coal production, labor and mining methods by states and calendar years].—U. S. Bur. of Mines; Bull. 115; pp 366; 50c.

Lathrop, L. A.—*Coal Trade in Wales During 1915*. [Extract from a report of the U. S. Bur. of Commerce].—Coal Tr. Bull. July 1 1916; p 50; pp 3½; 25c.

Manning, Van H.—*Hazards to Men Increase as Mines Become Larger and Employ More Men*. [A paper read before the meeting of operators and inspectors at Harrisburg, Pa.].—Coal Tr. Bull. July 1 1916; p 43; pp 4; 25c.

—*Rhodesia Chamber of Mines, Annual Report, 1915*. [Questions brought up during the year are spoken of, with accounts of the production of various metals and a review of the labor bureau].—Rhodesia Chamber of Mines, 1915 Report; pp 71.

Production

Bastin, E. S.—*Graphite in 1915*. [The market conditions and U. S. in general are reviewed and followed by separate reviews of the industry in each state].—Min. Res. of U. S. 11:11; pp 13.

Diller, J. S.—*Talc and Soapstone in 1915*. Each is taken separately in general for U. S. Both prices and production are given].—Min. Res. of U. S. 11:9; pp 4.

Fay, A. H.—*Coal Mine Fatalities in the United States, 1870-1914*. [Also contains statistics on coal production, labor and mining methods by states and calendar years].—U. S. Bur. of Mines; Bull. 115; pp 366; 50c.

Katz, F. J.—*Abrasive Materials in 1915*. [Each material is reviewed separately].—Min. Res. of U. S. 11:10; pp 16.

Katz, F. J.—*Feldspar in 1915*. [Reviews the occurrence and nature of the mineral, with methods of mining and refining and statistics on its production].—Min. Res. of U. S. 11:7; pp 11.

Lathrop, L. A.—*Coal Trade in Wales During 1915*. [Extract from a report of the U. S. Bureau of Commerce].—Coal Tr. Bull. July 1 1916; p 50; pp 3½; 25c.

—*Rhodesia Chamber of Mines, Annual Report, 1915*. [Questions brought up during the year are spoken of, with accounts of the production of various metals and a review of the labor bureau].—Rhodesia Chamber of Mines, 1915 Report; pp 71.

Mining Costs

McGrath, J. W.—*The Iron Mines of Wabana, Newfoundland*. [Describes the geology, nature of the ores, disposal of the same and mining costs].—Canadian Mg. Jnl. July 1 1916; p 315; pp 2½; 35c.

Wilson, P. D.—*Stopping in the Calumet & Arizona Mines, Bisbee, Arizona*. [Gives detail of procedure for systems used as square-setting, top-slicing, caving systems, etc.].—Bull. A. I. M. E. July 1916; p 1099; pp 19*; 35c.

—*Britannia Mining and Smelting Co., Ltd., Howe Sound, B. C.* [Reprint of a company balance sheet and report closed Jan. 1 1916].—Canadian Mg. Jnl. July 1 1916; p 323; pp 3¼; 35c.

Mining Miscellany

Crankshaw, H. M.—*Modern Methods of Mining and Ventilating Thick Pitching Beds*. [Confined to coal deposits. Details and drawings of the methods are shown].—Bull. A. I. M. E. July 1916; p 1159; pp 11*; 35c.

Wilson, P. D.—*Stopping in the Calumet & Arizona Mines, Bisbee, Arizona*. [Gives detail of procedure for systems used as square-setting, top-slicing, caving sys-

tems, etc.].—Bull. A. I. M. E. July 1916; p 1099; pp 19*; 35c.

MILL AND MILLING

Sampling

Turnbull, J. M.—*Relations Between Custom Smelters and Small Mine Owners*. [Abst. of an address to the Vancouver Chamber of Mines. Deals with the ways in which the ore is purchased by the smelters].—Mg. World July 8 1916; p 47; pp 2½; 10c.

Crushing, Grinding, Etc.

Howard, L. O.—*Copper Metallurgy at Garfield, Utah*. [Describes crushing, concentration, flotation and smelting as regards equipment and operations].—M. & S. P. July 8 1916; p 51; pp 3½; 20c.

Flotation

Anderson, R. J.—*Metallurgical Disposal of Flotation Concentrates*. [Missouri School of Mines Bulletin. Treats on the breaking and dewatering of the froth and the final methods of smelting the concentrate].—Mg. World July 8 1916; p 57; pp 2½; 10c.

Anderson, R. J.—*The Flotation of Minerals*. [A general detailed discussion and description of theory and practice].—Bull. A. I. M. E. July 1916; p 1119; pp 18; 35c. M. & S. P. July 8 1916; p 47; pp 3¼; 20c.

Howard, L. O.—*Copper Metallurgy at Garfield, Utah*. [Describes crushing, concentration, flotation and smelting as regards equipment and operations].—M. & S. P. July 8 1916; p 54; pp 3½; 20c.

Scott, W. A.—*The Old Dominion Copper Co.'s Operations, Arizona*. [The questions of hoisting, mine waters and concentration by flotation are dealt with].—Mg. World July 8 1916; p 43; pp 2¼*; 10c.

Amalgamation

Lamb, M. R.—*Don Luis Charme's Tremain Steam Stamp*. [Some details of worries which come to consignees of mining machinery in South America].—E. & M. J. July 1 1916; p 17; pp 2¼*; 25c.

Concentration: Sorting, Sizing, Washing

Howard, L. O.—*Copper Metallurgy at Garfield, Utah*. [Describes crushing, concentration, flotation and smelting as regards equipment and operations].—M. & S. P. July 8 1916; p 54; pp 3½; 20c.

Cyaniding

Edmonds, H. R.—*Some Notes on the Effect of Lead Salts and of Varying Degree of Alkalinity on the Solvent Power of Cyanide Solution for Gold*. [The results of tests are tabulated and described].—Jnl. Chamber of Mines West Aust. April 29 1916; p 63; pp 8; 75c.

Briquetting

Anderson, R. J.—*Metallurgical Disposal of Flotation Concentrates*. [On methods and results obtained in the breaking up and dewatering of the froth. The concentrates are smelted both direct and briquetted].—Mg. World July 8 1916; p 57; pp 2½; 10c.

Mill and Smelter Costs

Turnbull, J. M.—*Relations Between Custom Smelters and Small Mine Owners*. [Abst. of an address to the Vancouver Chamber of Mines. Deals with the ways in which the ore is purchased by the smelters].—Mg. World July 8 1916; p 47; pp 2¼; 10c.

—*Britannia Mining and Smelting Co., Ltd., Howe Sound, B. C.* [Reprint of a company balance sheet and report closed Jan. 1 1916].—Canadian Mg. Jnl. July 1 1916; p 323; pp 3¼; 35c.

CHEMISTRY AND ASSAYING

Chemistry

Diekman, P.—*Chemistry of Portland Cement*. [Abst. from the Jnl. of the American Soc. of Mechanical Engineers].—Met. & Chem. Engg. July 1 1916; p 41; pp 1½; 30c.

Hartman, M. L.—*Chemistry and Metallurgy of Tungsten*. [Abst. from Pahasapa Quarterly. Describes the hydrofluoric acid, fusion and aqua regia methods of analysis, all of which are gravimetric].—Mg. World July 8 1916; p 55; pp 1½; 10c.

Howland, H. P.—*Calculations with Reference to the Use of Carbon in Modern American Blast Furnaces*. [Discussion giving results of thermic tests and chemical reactions].—Bull. A. I. M. E. July 1916; p 1245; pp 7; 35c.

Layng, H. R.—*Determination of Antimony*. [Methods of procedure for a wet chemical method].—M. & S. P. July 8 1916; p 57; pp 1½; 20c.

Morgan, G. T.—*Some Chemical Aspects of the Peat Problem*. [Reprint from the Irish Technical Jnl. Treats on the using of this resource for making gas and ammonia products].—Jnl. of American Peat Soc. July 1916; p 141; pp 10*.

Watson, T. L.—*Zircon-Bearing Pegmatites in Virginia*. [The rock occurs in North Carolina and the chemical analysis of the rock is taken up in detail].—Bull. A. I. M. E. July 1916; p 1237; pp 7*; 35c.

Assaying

Sale, A. J.—*Drilling and Analysis of Copper Ores*. [A general discussion of errors made from taking averages of churn-drill hole samples. Also speaks of the sulpho-cyanide assay of copper].—E. & M. J. July 8 1916; p 87; pp 3¼; 25c.

Analysis

Hartman, M. L.—*Chemistry and Metallurgy of Tungsten*. [Abst. from Pahasapa Quarterly. Describes the hydrofluoric acid fusion and aqua regia methods of analysis, all of which are gravimetric].—Mg. World July 8 1916; p 55; pp 1½; 10c.

Layng, H. R.—*Determination of Antimony*. [Method of procedure for a wet chemical method].—M. & S. P. July 8 1916; p 57; pp 1½; 20c.

Lisitzin, Fr.—*Russian Peat Industry*. [Gives the results of the analyses of many samples].—Jnl. of American Peat Soc. July 1916; p 138; pp 3.

Runner, J. J.—*Specific Gravity Method for Tungsten Analysis*. [Curves for use in this connection are reproduced].—M. & S. P. July 1 1916; p 11; pp 2¼*; 20c.

Watson, T. L.—*Zircon-Bearing Pegmatites in Virginia*. [The rock occurs in North Carolina and the chemical analysis of the rock is taken up in detail].—Bull. A. I. M. E. July 1916; p 1237; pp 7*; 35c.

Thermic Metallurgy

Anderson, R. J.—*Metallurgical Disposal of Flotation Concentrates*. [On methods and results obtained in the breaking up and dewatering of the froth. The concentrates are smelted both direct and briquetted].—Mg. World July 8 1916; p 57; pp 2½; 10c.

METALLURGY

Thermic Metallurgy

Anderson, R. J.—*Metallurgical Disposal of Flotation Concentrates*. [Missouri School of Mines Bulletin. Treats on the breaking and dewatering of the froth and the final methods of smelting the concentrate].—*Mg. World* July 8 1916; p 57; pp 24; 10c.

Howard, L. O.—*Copper Metallurgy at Garfield, Utah*. [Describes crushing, concentration, flotation and smelting as regards equipment and operation].—*M. & S. P.* July 8 1916; p 54; pp 3½; 20c.

Sale, A. J.—*Drilling and Analysis of Copper Ores*. [A general discussion of errors made from taking averages of churn-drill hole samples. Also speaks of the sulpho-cyanide assay of copper].—*E. & M. J.* July 8 1916; p 87; pp 3¼; 25c.

Turnbull, J. M.—*Relations Between Custom Smelters and Small Mine Owners*. [Abst. of an address to the Vancouver Chamber of Mines. Deals with the ways in which the ore is purchased by the smelters].—*Mg. World* July 8 1916; p 47; pp 2¼; 10c.

Metallurgy General

Turnbull, J. M.—*Relations Between Custom Smelters and Small Mine Owners*. [Excerpts from an address to the Vancouver Chamber of Mines. Treats in general on the buying of ores by a custom smelter].—*Mg. World* July 8 1916; p 47; pp 2¼; 10c.

POWER AND MACHINERY

Electricity

Haas, Herbert.—*Diesel Engines Versus Steam Turbines for Mine Power Plants*. [Compares the advantages and costs of operating each with respect to generating electricity. Details on fuel costs are given].—*Bull. A. I. M. E.* July 1916; p 1171; pp 13*; 35c.

Moore, H. W.—*Blasting Practice at Chuquicamata, Chile*. [A system of electric blasting. Tunnels are made and loaded with powder for the blasting of large blocks of ground].—*M. & S. P.* July 8 1916; p 60; pp 2*; 20c.

Taylor, W. G.—*Oil Well Motor Equipment*. [A paper read before the American Inst. of Elect. Eng. Gives the electrical power and equipment needed in drilling an oil well].—*Jnl. of Elect. Power & Gas* July 1 1916; p 6; pp 2½*; 35c.

Compressed Air

Johnson, J. E., Jr.—*The Rate of Driving the Blast Furnace*. [The effects resulting from too slow or fast a rate are discussed in detail in particular on the power requirements for blowing and fuel consumption].—*Met. & Chem. Engg.* July 1 1916; p 21; pp 4¼*; 30c.

Gas Producers, Producer Gas

Morgan, G. T.—*Some Chemical Aspects of the Peat Problem*. [Reprint from the Irish Technical Jnl. Treats on the using of this resource for making gas and ammonia products].—*Jnl. of American Peat Soc.* July 1916; p 141; pp 10*.

Combustion Engines

Haas, Herbert.—*Diesel Engines Versus Steam Turbines for Mine Power Plants*. [Compares the advantages and costs of operating each with respect to generating electricity. Details on fuel costs are given].—*Bull. A. I. M. E.* July 1916; p 1171; pp 13*; 35c.

Steam and Steam Engines

Haas, Herbert.—*Diesel Engines Versus Steam Turbines for Mine Power Plants*. [Compares the advantages and costs of operating each with respect to generating electricity. Details on fuel costs are given].—*Bull. A. I. M. E.* July 1916; p 1171; pp 13*; 35c.

Hubbard, C. L.—*Boiler and Piping Arrangements for Small Central Plants*.—*Steam* July 1916; p 3; pp 2¼*; 35c.

Hubbard, C. L.—*Steam Requirements for Power and Heating*. [General and detailed information on the design and operation of steam plants].—*Engg. Mag.* July 1916; p 553; pp 9*; 35c.

Keller, J. H.—*New Empirical Formulas for Hot Water Heating, with Pipe Sizes for Two-Pipe Systems*.—*Steam* July 1916; p 11; pp 2; 35c.

White, A. E.; Wood H. F.—*Recrystallization of Boiler Tubes*. [A paper read before the American Soc. of Testing Materials].—*Iron Age* July 6 1916; p 20; pp 1¼; 30c.

— *Coal Miners' Pocketbook*. [Gives rules, principles, formulas and tables].—*McGraw-Hill Co.*; book; pp 1172*; \$1.

— *Cost of Coal and Oil as Fuel*. [Abst. from *Power*. The cost of steam per pound is given, with the evaporation per pound of coal and B. T. U. per gallon of oil].—*E. & M. J.* July 8 1916; p 93; pp 1¼*; 25c.

Miscellaneous Power and Machinery

Morrison, C. J.—*Belts—Their Selection and Care*. [Thoroughly practical information with no theory or formulas].—*Engg. Mag.* July 1916; p 567; pp 19*; 35c.

— *Coal Miners' Pocketbook*. [Gives rules, principles, formulas and tables].—*McGraw-Hill Co.*; book; pp 1172*; \$1.

IV. MISCELLANEOUS

Miscellaneous Costs

Haas, Herbert.—*Diesel Engines Versus Steam Turbines for Mine Power Plants*. [Compares the advantages and costs of operating each with respect to generating electricity. Details on fuel costs are given].—*Bull. A. I. M. E.* July 1916; p 1171; pp 13*; 35c.

Mason, J. K.—*How to Study Factory Efficiency*. [The methods and ideas are of a nature which makes them possible of application to the studying of efficiency in any operating body].—*Engg. Mag.* July 1916; p 542; pp 5½*; 35c.

McBride, W. G.—*Motor Truck Operation at Mammoth Collins Mine, Shultz, Arizona*. [Some costs of operation are given].—*Bull. A. I. M. E.* July 1916; p 1253; pp 4; 35c. *M. & S. P.* July 8 1916; p 45; pp 2; 20c.

Sale, A. J.—*Drilling and Analysis of Copper Ores*. [A general discussion of errors made from taking averages of churn-drill hole samples. Also speaks of the sulpho-cyanide assay of copper].—*E. & M. J.* July 8 1916; p 87; pp 3¼; 25c.

— *Cost of Coal and Oil as Fuel*. [Abst. from *Power*. The cost of steam per pound is given, with the evaporation per pound of coal and B. T. U. per gallon of oil].—*E. & M. J.* July 8 1916; p 93; pp 1¼*; 25c.

Testing

Edmunds, H. R.—*Some Notes on the Effect of Lead Salts and of Varying Degree of Alkalinity on the Solvent Power of Cyanide Solution for Gold*. [The results of tests are tabulated and described].—*Jnl. Chamber of Mines West Aust.* April 29 1916; p 63; pp 8; 75c.

Howland, H. P.—*Calculations with Reference to the Use of Carbon in Modern American Blast Furnaces*. [Discussion giving results of thermic tests and chemical reactions].—*Bull. A. I. M. E.* July 1916; p 1245; pp 7; 35c.

Mathewson, C. H.; Thalheimer, E. M.—*Comparisons Between Electrolytic and Two Varieties of Arsenical Lake Copper with Respect to Strength and Ductility in Cold-Worked and Annealed Test Strips*. [The results are tabulated and the nature of each test is described].—*Bull. A. I. M. E.* July 1916; p 1185; pp 40*; 35c.

Law, Legislation, Taxation

Ball, Max. W.—*Petroleum Withdrawals and Restorations Affecting the Public Domain*. [Gives the law controlling petroleum lands, with information on withdrawals and restorations. Maps, by states, are given, showing the areas affected].—*U. S. G. S. Bull.* 623; pp 425; \$1.20.

— *Rhodesia Chamber of Mines, Annual Report 1915*. [Questions brought up during the year are spoken of with accounts of the production of various metals and a review of the labor bureau].—*Rhodesia Chamber of Mines, 1915 Report*; pp 71.

Societies

Parsons, F. W.—*The Rocky Mountain Coal Mining Institute Meeting*.—*Coal Age* July 8 1916; p 66; pp 6*; 20c.

— *American Society of Testing Materials*.—*Iron Age* July 6 1916; p 24; pp 5; 30c.

— *Mine Inspectors' Institute, U. S. A.*—*Coal Age* July 8 1916; p 64; pp 1½; 20c.

Financial

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Conditions in the copper market have undergone no essential change since our last report. Business has been lacking and price recessions are steadily appearing, although the extent of the decline has been small. The situation in the red metal is undergoing more analyzing at the present time than when the price was around 11c. On every hand one hears of either an inflated copper market or one fundamentally strong. The absence of business has caused those to believe that the situation has been inflated to give vent to their beliefs in circular letters. They point out that the efforts of copper producers to maintain prices above 25c will be extremely harmful, unless there is a strong certainty that war buying will again come to the fore. Otherwise they assert that a bulge worse than that of 1907 will transpire. Some conservative copper factors declare that the large producers are using their abnormal profits to tide the market over the dull period and that unless business again develops on an extensive scale these producers will not only have lost a good part of their profits but also sacrificed an opportunity to maintain a strong market for the metal for a lengthy period. In other words, they contend that it would be far better to bring copper down to a stable basis around 20c with steady buying than to maintain prices from 27c to 29c until consumers can be forced to buy.

Copper has always been a subject of conflicting views owing to the active speculation that exists in the metal. The opinions expressed above are comblated by views of producers who assert that the status of the market is as strong as could be wanted. In the first place, production over the rest of the year to the extent of about 70% is already sold. The warring powers are deferring copper buying until the results of the summer military operations can be studied so that a basis of opinion as to the war's duration can be formed. In the event that the conclusion is reached that the war will continue well into the summer of 1917, perhaps into the winter of next year, then a resumption of war material buying on a tremendous scale will be witnessed. Producers of copper are banking on the war continuing into 1917. Explaining the maintenance of the present high copper prices one large producer asserted that the extensive orders now booked fully warranted the present level of values and as to their being a repetition of 1907 he scouted the idea, declaring that producers were doing all in their power to prevent a top heavy market. "We have built this structure carefully," said this producer. "The foundation can support much more. There need be no danger of it toppling."

Resellers sold nearby electrolytic down to 21 $\frac{1}{4}$ c with August electrolytic offered at 21c and September to December at 23 to 23 $\frac{1}{4}$ c, the inside price being for the latter month. First hands, however, asked 26 $\frac{1}{2}$ c to 27 $\frac{1}{2}$ c for September to December. It must be stated that the reported quotations of 29c to 29 $\frac{1}{2}$ c for the late months are absolutely fictitious. Spot casting copper was sold this week at 23 $\frac{1}{2}$ c with producers quoting August and September at 23 to 23 $\frac{1}{4}$ c.

The London market moved up and down since our last report and the trend can not be defined. Some days standard advance and electrolytic declined, a condition which reflects manipulation of standard by English Government officials.

Quotations for copper per pound at New York for the week ended July 19 were as follows:

	(For Third Quarter Delivery.)

Tin.—Stagnation in the tin market has been prevailing now for 4 weeks and prices are showing the effect of the

lack of demand. Sellers have lowered prices on spot and futures but without inducing any response from users. Consumers are well supplied up to September. Sellers are now paying for the false alarms that stirred tin consumers last March and February. At that time, it will be recalled, the closing of the Suez Canal caused a very active demand for futures, consumers buying up to September fearing delays in arrivals due to the longer voyage around the Cape of Good Hope. Being well stocked and amply protected by supplies afloat consumers are ignoring the current market and holders of unsold spot tin are seeking to liquidate before their losses become greater. Spot straits tin has been offered down to 38 cts. with spot Banka held at 37 cts. Importers have done no business either, as consumers realize that their indifference may bring still lower prices for September to December deliveries. At the present time August delivery is held at 37½ cts., September and October at 37½ cts. and November and December at 37¼ cts.

Arrivals of tin are increasing but July is not expected to equal June imports. Up to July 17 imports total 1530 tons, while the stock afloat totals 2109 tons. On this basis it is possible that stocks at the end of July will be smaller and should straits shipments show a decline the improved statistical position may swerve the market more in the favor of the metal.

Foreign markets continued their downward movement, traders abroad feeling the effect of the smaller demand from this country. Last week Singapore dropped £2 10s and opened this week £4 10s lower. Straits tin at London declined £4 last week with a drop of £2 10s on Monday. Standard tin has also been declining.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended July 19 were as follows:

	New York		London.	Singapore.
	Spot.	July.

Lead.—Another reduction by the American Smelting & Refining Co. is impending. The cut on July 5 failed of its purpose and instead of stimulating business has had the opposite effect with the market steadily weakening. Consumers will not buy on a declining market and the lack of business is causing supplies to accumulate despite the fact that producers have good orders for future delivery. Little is heard of the weakness in lead being a bear drive on ore, as the ore market has been declining of late. Independents reported that some business could be closed if the spread in prices were narrowed but with the A. S. & R. Co. quoting 6 50 cts., New York 6 42½ cts., St. Louis and outsiders 6 25 cts. New York and 6 25 cts. St. Louis the market is unbalanced and consumers look for lower prices. Foreign business has not appeared but buying agents intimate that business may be done after the next reduction.

The London market held firm in spot with futures showing a slightly easier tendency at times. The fluctuations were small and cable advices indicate that the London lead market is dull and featureless.

Quotations for lead per pound at New York and per ton at London for the week ended July 19 were as follows:

	New York		London	
	Indpts.	A. S. & R. Co.	Spot.	Futures.

Lead Ore.—In the Missouri-Kansas-Oklahoma district the Riverton electric plant in the Empire district was down during the week ended July 15 and caused the closing down of many producers. Prices for lead ore were slightly off during the week. For the most part \$72.50 was obtained, but this ranged down to \$70. There were produced during the week 1,882,500 lbs. of concentrate and the total for the year to that date was 59,031,632 lbs. These were given the respective values of \$70,618 and \$2,606,515.

Zinc Ore.—In the Missouri-Kansas-Oklahoma district the drop in spelter was felt by the ore market, and prices were down another \$5 for the week ended July 15. The top price paid was \$75 and this ranged down to \$50. Towards the latter part of the week a general strengthening tendency seemed to be making its appearance. Production for the week was 10,236,990 lbs. bringing the total for the year to 384,482,544 lbs. These amounts were respectively valued at \$333,002 and \$18,034,698.

Calamine was down a little for the better grades, being quoted at \$50, with the poorer grades being offered at \$40. There were 88,750 lbs. produced and the total for the year to date was 18,963,030 lbs., these being valued at \$1980 and \$703,453.

Spelter.—Consumers of spelter have become alert to the opportunity that the present prices contain and are covering requirements over the third quarter. Business has bloomed out and sellers are taking good sized orders for the first time in almost 2 months. Most of the spot metal now being sold is from dealers who are accepting losses while producers are endeavoring to limit forward business, in fact, absolutely declining to accept fourth quarter contracts at the present range of prices. Spot business was mainly done at 8¾ cts. New York and 8½ cts. St. Louis, with August delivery sold at 8¼ cts. St. Louis and September at 8.00 cts. St. Louis. As has been pointed out these prices are unusually low considering that we are in the midst of a great war with the increased consumption that it entails. Consumers

realized this state of affairs and entered the market at the opportune time. There has been a change of trend at London also. After having experienced the most violent reaction the market is beginning to recover but the advances are small compared with the declines. Last week spot advanced £3 and futures £2 10s with further advances this week that brought spot up to £48 and futures to £44.

Quotations for spelter per pound at New York and per ton at London for the week ended July 19 were as follows:

	New York		London	
	Spot.		Spot.	Futures.
July 13.....	9.00c		£45 5 0	£43 10 0

*For the first nine months; spot market nominal thereafter.

MISCELLANEOUS METALS.

Quicksilver.—Business in quicksilver has been less active, but the market has remained firmly established at \$83 per flask for virgin spot. There is a fair amount of metal on the market and incoming supplies are adequate.

Antimony.—Sellers have offered spot antimony at 14½ cts. a lb., but no buyers have cared to take the metal even at this price. It appears that nothing can develop that will prevent antimony from going below 10 cts. Producers are actively competing for business and are now beginning to lay lines for trade after the war. It is realized that Cooksons and Hallett's can quickly regain their trade and the Chinese and Japanese are now desirous of arranging long term contracts with consumers at prices slightly above normal.

Nickel.—Aside from the stir created by the trouble that will develop due to the sale of nickel to Germans for transportation on the submarine Deutschland the trade has little to engage its interest. Demand is small but prices are maintained at 45 to 50 cts. for ordinary forms and 5 cts. extra for electrolytic. England plans to blacklist every metal house having allowed Germans to secure hold of nickel and the trade is waiting to see where the hatchet will fall.

Platinum.—Prices are receding on platinum, sales having been made at \$63 to \$65 per ounce as against a price of \$88 an ounce prevailing two months ago.

Finished Copper, Brass and Other Products.—Lead sheets have been lowered and prices on seamless tubes have been revised downwards. An easier tone is also noted in copper wire. Following prices are all f. o. b. mill:

Sheet zinc	\$17.00@
Sheet aluminum, 1917, contract	40.00@
Sheet aluminum, outside market, prompt shipment	80.00@95.00
Copper wire	29.00@32.00
Sheet copper, hot rolled	37.50@
Sheet copper, cold rolled	38.50@
High brass sheet, wire and rods	38.00@39.50
Low brass sheet, wire and rods	39.50@42.00
Bronze sheet and wire	40.00@42.00
Bronze rods	40.00@42.00
Erased brass tubing	45.00@46.50
Brazed brass tubing	46.00@47.00
Seamless copper tubing	43.00@44.00
Seamless brass tubing	42.00@43.00
Seamless bronze tubing	43.00@44.00
Full lead sheets	8.75@
Cut lead sheets	9.00@

Pig Iron.—There has been no cessation in foreign buying of Bessemer iron, Italy and France taking over 40,000 tons in the past week, while new inquiries in the market call

for 75,000 tons. Bessemer remains firm and unchanged at \$21 to \$21.50 valley furnace. Foundry grades are inactive with furnace prices steady.

Ferromanganese.—Sellers of both domestic and foreign ferromanganese have lowered their prices for nearby deliveries to \$175, this being similar to the quotation for 1917 contracts. Spot English 80% has sold at \$175 seaboard, while domestic furnaces have also taken business at \$175 furnace. Little in the way of contract business is noted. Spiegeleisen is quiet with the market showing an easy tendency and prices quoted at \$50 to \$55 furnace for 20%.

Ammonia—			
Muriate, white grain, lb.....	.08¾	to	.08¾
Muriate, lump.....	.17	to	.18
Arsenic—White, lb.....	.06¼	to	.06½
Red, lb.....	.55	to	.60
Barium Chloride—Ton.....	110.00	to	115.00
Nitrate, kegs, lb.....	.14	to	.15
Bismuth—Metallic, lb.....	3.11	to	3.20
Subnitrate.....	3.10	to	3.15
Bleaching Powder—			
Drums, 100 lbs.....	5.25	to	5.75
Borax—100 lbs., car lots.....	8.00	to	8.25
Coke—Connellsville furnace.....	2.50	to	2.75
Foundry.....	3.00	to	3.50
Copperas—Spot, lb.....	1.50	to	2.00
Ferromanganese—Spot.....	175.00	to
Last half.....	175.00	to
Ferrosilicon, 50%.....			85.00
Ferrotitanium, per lb.....	.08	to	.12½
Fuller's Earth, 100 lbs.....	.80	to	1.05
Glaucous Salts, bags.....	.60	to	.70
Calced.....			2.50
Iron Ore—			
Bessemer, old range, ton.....			4.45
Bessemer, Mesabi.....			4.20
Non-Bessemer, old range.....			3.70
Non-Bessemer, Mesabi.....			3.55
White crystals.....	.15¾	to	.15¾
Broken, cakes.....	.14¾	to	.15
Powdered.....	.17	to	.17½
Lead—Granulated, lb.....	.15	to	.15¾
Brown sugar.....	.13¾	to	.14
Litharge, American, lb.....	.09	to	.09½
Mineral Lubricants—			
Black summer.....	.13	to	.14
20 gr., 15 c. t.....	.14	to	.15
Cylinder, light, filtered, gal.....	.21	to	.26
Neutral, filtered, lemon, 20 gr.....	.37½	to	.38
Wood grade, 30 gr.....	.19½	to	.20
Paraffin—High viscosity.....	.29½	to	.30
Naphtha (New York)—			
Gasoline, auto.....	.32¾	to	.33¾
Benzine, 59 to 62°, gal.....	.29	to	.29½
Nickel Salt, double.....	.07½	to	.08½
Single.....	.10½	to	.11
Petroleum—			
Crude (jobbing), gal.....	.15	to	.18
Refined, bbl.....			.12
Platinum—Oz. ref.....	80.00	to	84.00
Potash Fertilizer Salts—			
Kainit, min, 16% actual potash.....			32.00
Muriate, 80 to 85%, basis 80%, ton.....	450.00	to	475.00
High grade sulphate, 90 to 95%, basis of 90%.....	400.00	to	450.00
Hard salt, man., 12.4% actual potash.....	Nominal		32.00
Potassium—			
Bichromate.....	.39	to	.40
Carbonate, cal. 96 to 98%.....	1.30	to	1.35
Cyanide, bulk, per 100%.....	.75	to	1.00
Chlorate.....	.48	to	.50
Prussiate, yellow.....	.95	to	1.00
Prussiate, red.....	3.50	to	4.00
Salt peter—Crude, lb.....	.15	to	.15¾
Refined.....	.27	to	.29½
Soda—Ash, 58% (43% basis), bbl.....	1.25	to	1.50
Strontia Nitrate, casks, lb.....	.48	to	.50
Sulphur—			
Crude, ton.....	28.50	to	29.00
Flowers, 100 lbs.....	2.50	to	2.70
Roll, 100 lbs.....	1.95	to	2.25
Tin—Bichloride, 50°, 100 lbs.....	.13¾	to	.14¼
Crystals, bbls., lb.....	.30	to	.30¾
Oxide, lb.....	.44	to	.46
Zinc Chloride.....	.14	to	.20

RUSH CAMP IN BUFFALO RIVER DISTRICT.

YELLOW ROSE IN RUSH CAMP.

Great Activity in the North Arkansas Zinc Fields

By THOMAS SHIRAS.

During the first 6 months of this year, according to reports from the ore buyers in the North Arkansas zinc field, the production was as much as the entire production of 1915. The production in that year was between 400 and 500% more than it was in 1914, and the last 6 months in this year promises to see the first 6 months' output doubled.

The field is just beginning to catch its stride, and is responding with cash dividends, to the more modern and thorough mining and milling methods that have been introduced during the past year's operations. There is not an idle mill in the whole field, and new installations during the year will average one each 2 weeks.

When the price of zinc ore began to soar a ripple of unrest swept over the field. It struck the local people first, especially those who owned land that showed croppings of free carbonate or silicate ores. They started to work and began to make a production immediately. Then suddenly the outsiders began to come in.

Few flat country operators are entering the field. Most of them are coming from the west, and from Mexico. They are introducing mountain methods, which accounts largely for their success. Up until last year nothing but flat country mills and methods were being used.

The ore bodies that are being worked are practically all in the upper ore-bearing stratas that outcrop on the mountain sides. They are worked by tunneling. Some of these tunnels have been driven back in ore to a distance of 1500 ft., which has proven conclusively that these deposits are not just rim deposits, but extend into the mountains. Invariably they are found in breaks, synclines, fractures or old underground water courses, that have become choked.

By far the greatest part of the ore that is being mined in the field is carbonate and silicate. It would be quite safe to say that nine-tenths of the production of the field is this class, assaying anywhere from 30 to 49% metallic zinc; much of it is shipped to the smelters just as it comes from the ground, without crushing or cleaning. This ore is termed hand-cobbed ore, and is in strong demand by the smelters.

Some drilling has been done in the valleys, and bodies of sulphide ores have been encountered, but they will not be mined to any considerable extent for many years, as the ore in the upper stratas is much more easy to mine, and can be produced much cheaper.

At the present time there are between 300 and 400 mines working in the field. Most of these however are small diggings, being operated with a force

O'MEARA MINE IN BUFFALO RIVER DISTRICT.

of from 2 to 5 men. Invariably these small mines are free-ore producers, and are being worked by men with small capital. This one feature has been responsible to a great extent for the success of the field during the last year. A man does not need a fortune to start operations. It is not a trust ridden field owned by a few big corporations. Every man is his own boss who can raise a grubstake. He can always find some land owner that will stake him with a lease to work on. He has the same chance as the old placer gold miner of the west had, for his free-

MACKINTOSH IN RUSH CAMP.

ore carbonate mine at the start has a good chance to develop into a big mill proposition with enough development work.

During the past 12 months, a much better working knowledge has been gained of the field, and some very glaring mistakes have been found that in a great measure were responsible for failures during the early history of the field.

One of the most startling disclosures that have

been made was the fact that former operators in the field threw away into their tailings piles on an average of 4% of their values. Mill construction during the early history of the field was very poor as far as it pertained to saving values. Few mills had tables or even sand jigs. Carbonate and silicate ore does not have quite as much specific gravity as jack. In some instances it is so closely interwoven in fine grains into the lime, that unless ground very fine complete recovery is impossible. The values were

ROSLN JACK MINE IN ZINC CAMP.

lost both in the coarse and fine tailings. Some of these tailings piles have been found to contain as high as 8%. In a late interview with J. C. Shepherd, of Rush, the largest producer in the field, he states that a saving of all but slightly over 1% is possible. He has been experimenting for several months on this one problem, and at this time is building a 200-ton tailings mill on his Big Hurricane mine in Searcy county, and will run his 25,000-ton tailings pile over it, and all other tailings that come from his regular concentrating mill.

A radical change in mills has been made during the last few months. Tables of the Wilfley type have been installed, also sand jigs, and extra rolls, and the loss generally hereafter will be small.

During the early history of the field flat country mills were constructed in spite of the fact that nine out of ten mines were high enough on the hill to in-

SURE POP MINE ON WATER CREEK.

stall gravity or mountain mills. Now wherever feasible the gravity type is being constructed.

There has also been a radical change in power. To the average man who comes into the field and looks at the countless mountains covered with growing timber, the fuel question is settled for him at once. Cheapest on earth, he thinks. But it has been found to be the most expensive steam producing fuel that could be had. Last winter shutdowns were numerous because of lack of wood cutters. The roads

SILVER HOLLOW PROPERTY IN BUFFALO DISTRICT.

are rough and in bad weather it is hard to get teams to haul.

Crude oil was tried under the boilers as a substitute, but was not much better owing to long hauls, and the power has finally evolved itself into gasoline engines, which are giving the satisfaction desired. Over wood they have cut the power cost on 100-ton plants \$25 a day.

Knowledge of ore too has been one of the most important things gained. The field produces an unlimited number of carbonate and silicate ores. Not a week passes that does not bring in one different in color, texture or weight from anything that has been found. Old dumps have been cleaned up in the field that have been rich in value, in which the operator who did the work years ago didn't know he had a "shine." These old diggings have been eagerly looked for, and many of the best mines in the field

GROUND HOG MINE ON COW CREEK.

MARKLE MINE IN DODD CITY CAMP.

are now in these old cuts and tunnels, that were considered non-productive 10 or 20 years ago.

The producing counties in the field now are Marion, Baxter, Boone, Newton, Searcy and Sharp. Independence and Izard counties are producing large quantities of manganese ore, but no zinc. Prospecting is general over those counties, and also in Stone and Izard, where some good ore bodies apparently will be developed during the next few months.

Cement Industry in 1915.—Shipments of natural cement in 1915 were 750,863 bbls., valued at \$358,627, a decrease in quantity of 422 bbls. and an increase in value of \$7257, compared with 1914. There was a slight increase in shipments of Portland cement and a small decrease in production and stocks, compared with 1914, shown as follows: Shipments in 1916, 86,891,681 bbls.; in 1915, 86,437,956. Production in 1915,

MORNING STAR GROUP IN RUSH CAMP.

85,914,907 bbls.; in 1914, 88,230,170 bbls. Stocks in 1915, 11,781,166 bbls.; in 1914, 12,773,463 bbls.

The method of handling material by means of a cableway is one which has a great deal of practical interest for all mining men interested in heavy excavating, filling and erective work, the construction of a power or reservoir dam, headworks, etc., stripping deposits and the disposal of waste, tailings, or other refuse over a dump.

C. F. Kelley on the Proposed Tax on Copper.

It is the belief of C. F. Kelley, vice-president of the Anaconda Copper Co., that the tax on copper which is incorporated in the new revenue bill will be stricken out in the senate. In a recent interview Mr. Kelley discussed the situation and the result of his trip to Washington:

I, of course, have no definite knowledge as to what the action of either the senate finance committee or that body itself will be upon the proposed measure. Upon our arrival in Washington we found that protests had been received from practically every commercial body in the state of Montana and from a large number of prominent citizens, including not only those who would be directly or indirectly affected, but also disinterested people who merely had the general welfare of the state at heart. We also found that the matter of opposing this provision of the bill has been actively taken up by the congressional delegations of many of the western states, but particularly by the Montana delegation, under the very able and intelligent leadership of Senator Walsh, Senator Myers being ill at the time. Mr. Evans had opposed the measure in the house, and had there been further time for consideration, I believe that his effort to have the provision stricken from the bill in the lower house would have been successful. Our mission resolved itself merely into that of furnishing such information, statistical and otherwise, with reference to the copper business, as was available to those directly engaged in it.

As a matter of fact there prevails an erroneous impression as to the amount of copper which is being used in munition manufacture. It is quite impossible for the producers to follow the copper disposed of to its ultimate use, as by far the greater part is worked up into brass and other alloys and used by manufacturers engaged in making an infinite variety of articles, of which munition manufacture is in some instances incidental to, or forms a part only of the general business conducted. Pure copper is used in munition manufacture for only two purposes, to wit: The primer of shells and the expansion ring that follows the rifling of the gun discharging the shell. The amount used for this purpose is infinitesimally small compared to the general production. A compilation of the uses to which copper is put in the arts and industries would, and does, fill an exceedingly large volume. A mere suggestion of the general production of the mills and foundries, such as wire and bar, brass and bronze, sheet copper, tubes, etc., indicates the infinite variety of useful purposes to which these different manufactured shapes or alloys are devoted. It has been estimated that there is over a billion and a quarter pounds of copper in the telephone and telegraph mileage of the world; that in the single long distance telephone circuit established between New York and

San Francisco there is about 6,000,000 pounds of copper.

In the electrification of the Butte, Anaconda & Pacific, for instance, 11,800 lbs. of copper per mile were used; in the electrification of the St. Paul more than 24,000 lbs. per mile were used. In an ordinary steam locomotive there is more than 3000 lbs. of copper. It enters into practically every line of trade, among which principal items may be mentioned electric lighting industry, boat and ship building, heating and cooking devices, building construction, hardware and coinage. It is estimated that fully 100,000,000 lbs. of bearing metal is milled annually in the United States to take care of the demand for new journals. Of this amount probably 50,000,000 lbs. so destroyed is copper, so that the manifest injustice of taxing every pound of copper produced and classifying it as a war munition becomes readily apparent. Moreover, it is doubtful if the demand for copper during the past year and a half would not have been substantially as great, although no doubt the price would have been much less, had there been no war.

Germany and Austria constitute the principal copper customers of the world. In 1913 the United States exported to Germany and Austria alone, according to a leading authority, 587,000,000 lbs. of copper. This export business has been wholly destroyed by the war. It may be conservatively stated that the amount of copper which has gone into war munitions since the declaration of war has been considerably less than the amount which would have been furnished to the market of which the United States has been thus deprived.

Another fallacy is that the export business has tremendously increased on account of shipment of tremendous amount of copper to the allies. The figures available in the advance sheet of the United States geological survey show that the total exports of copper during the year 1915 amounted to about 682,000,000 lbs., as against 840,000,000 for 1914, 817,000,000 for 1913 and 775,000,000 for 1912. An analysis of our export figures discloses that in 1915 there was less copper exported from the United States to Europe than in any year since 1910. It is no doubt true that in addition to the raw copper exported a very large quantity was exported in the shape of manufactured munitions, the exact amount of which is unattainable.

All this merely discloses the iniquity of the proposed measure in attempting to fix a tax as a war munition on the total production of the United States, irrespective of the purpose to which it was intended. However, it is gratifying to feel that through a proper presentation of the matter, particularly by the Montana delegation, a better understanding of the situation has been arrived at and the hope may be confidently expressed that the proposed copper tax will be eliminated from the bill.

The United States Potash Corporation was incorporated at Dover, Del., with \$10,000,000 stock, to mine for gold, silver and all kinds of ores.

Ore Sampling Conditions in the West

By T. R. WOODBRIDGE.*

The success of every mining enterprise depends on accurate knowledge of the constituents of the ore taken from the mine. This knowledge may be least necessary for a placer mine or for a company producing bullion from its own ores, but it is absolutely necessary to a company selling its ore, or to a smelter, custom mill, or sampling plant buying the ore.

In spite of the importance of sampling, a large part of the ore sampling of today is not done on a scientific basis. There are many operators seeking thoroughly satisfactory methods of sampling who, nevertheless, are not doing as accurate work as the present state of the industry permits. On the other hand, investigation shows that in the majority of sampling plants there is a great lack of uniformity, and that even in individual plants several methods or combinations of methods may be found.

Discussions concerning the theory and practice of ore sampling have appeared at various times in the transactions of the engineering societies and the technical press, but have not resulted in any general uniformity of practice. Especially is this true in regard to discarding methods known to be unreliable. Doubtless some operators are satisfied with this state of affairs and are not concerned with the accuracy of the sampling of individual lots of ore, provided the total purchase price of all lots equals the total value recovered during a certain period of time. Also, a few operators have worked out the problem of sampling for their local conditions to their own satisfaction and profit, and therefore do not welcome any criticism that may result in a change of methods. Most sellers and buyers of ore, however, are frankly disgusted with the persistent use of incorrect methods and would welcome a thorough investigation and discussion of the subject.

In connection with its efforts to increase efficiency in the mineral industries, the Bureau of Mines has undertaken to investigate present methods of sampling and analyzing ores in this country and to present the facts to all who may be interested in their study and discussion.

The object is to give the facts regarding the present methods of ore sampling in the hope that there may be discussion that will ultimately result in the standardization of sampling methods. Sampling would thus be raised from the position of an art to that of an exact science, where it properly belongs.

The first step forward would be the discarding of methods known to be inaccurate and of methods that, under certain conditions, may be manipulated to give inaccurate results to the advantage of either the seller or the buyer. This would eliminate one of the chief causes of the friction that often develops between the

seller and the buyer. At any rate, each party to the transaction should be familiar with the limitations of the method that has been employed by mutual consent, so that neither party will feel that the other is obtaining an unfair advantage.

Scope of the Investigation.

The subject of ore sampling is considered under five divisions, as follows: A definition of ore sampling; the condition of the ore as affecting sampling; description of the various methods of sampling used in the West, with flow sheets showing their application, and a criticism of certain details of practice; discussion of the methods investigated; and recommendations. The report deals principally with the first three of these divisions, although it may occasionally encroach upon the other two.

An exhaustive review or criticism is not attempted, and such deductions and suggestions as are made are offered with the knowledge that there must necessarily be some difference of opinion among well-informed and honest operators. It is therefore hoped that this paper will be freely discussed by those who can offer constructive criticism.

Correct Ore Sampling Defined.

The correct sampling of a lot of ore is the process of obtaining from it a smaller quantity that contains, in unchanged percentages, all the constituents of the original lot.

The commercial object of sampling is accomplished when the ultimate sample obtained meets the above conditions within an allowable limit of error, and has been obtained with reasonable speed and at a moderate cost. The final sample should be dry and of such bulk and degree of fineness as to be immediately available for the determination by the assayer or chemist of one or more of its constituents.

The commercial sample of an ore need not be more exact than the limits of error in the methods of determination employed by the assayer or chemist.

Conditions Affecting Ore Sampling.

The obtaining of a satisfactory sample of an ore would be a comparatively simple undertaking if the constituents to be determined were uniformly distributed throughout the whole mass. In most ores, however, the constituents, particularly the gold and silver, are more or less segregated. Ore in place in the mine is rarely of uniform metal content. The process of mining generally aggravates this condition, as the more heavily mineralized parts usually break up more readily, so that the finer particles frequently contain a higher percentage of the valuable constituents than the coarser particles.

Should the ore be screened before being sampled,

*Bureau of Mines. Excerpt from advance proofs of Technical Paper 86.

the difference may be lessened but never entirely eliminated. With every crushing during the sampling process this difference will persist to a varying degree, even after the final pulp has passed through a 120-mesh screen. Occasionally the condition is reversed—that is, the gangue breaks up more readily than the more heavily mineralized ore—but this does not alter the problem that arises through the segregation of certain constituents of the ore during mining and sampling.

In either event, even after repeated crushing and rolling (crushing with rolls), there still exists an imperfect mixture of fine and coarse particles, ranging from impalpable dust to pieces several inches in diameter. Unfortunately no method for making an intimate and uniform mixture of ore particles of various sizes has ever been discovered. No amount of shoveling or coning and no form of revolving receptacle will accomplish more than to make the segregation somewhat less apparent to the eye. When such a mixture is taken up with a shovel, the coarser particles tend to roll off or to collect at the edges of the shovel; if thrown upon a cone, the coarser particles tend to roll outward to the edge of the cone; if allowed to slide to the floor from an inclined chute, the coarser particles will run ahead and will accumulate farther from the edge of the chute than the finer, slower moving particles; if the ore falls through a long spout, the larger particles will bound from side to side, while the smaller particles will proceed in a more direct course; if fed into a revolving barrel, the finer particles will be carried higher on the side of the barrel and will be discharged from a different point than the coarser particles. When the mixture is screened, the softer and finer particles pass through first.

In fact, every time that the ore is handled the particles tend to segregate according to size. This tendency to segregate is frequently mentioned, as it forms the basis for most of the schemes for favoring either the buyer or seller of ore.

In considering the reliability of any sampling method this tendency to segregation should be constantly borne in mind. For any system or any detail of a system that may tend to make possible the selection or rejection of the finer or coarser particles should be considered inaccurate. So absolutely does the accuracy of a sampling method depend on freedom from selection that one may forget that gold, silver and other metals are to be determined by the process and examine the method solely as to its ability to take from a lot of ore the same proportion of all the various sizes of particles.

Lack of Uniformity in Sampling Methods.

The success of the older systems of ore sampling is considered by many to depend on the possibility of mixing particles of ore varying widely in size and in the percentage of their various constituents, whereas in reality it depends on the uniformity with which these

particles are finally distributed around the axis of a truncated cone.

With the further study of the subject and through the comparisons resulting from repeated sampling of the same product by the use of different methods, there has been developed the so-called "automatic" or "mechanical" systems of sampling, which are founded on the principle of taking small portions from the stream of ore at frequent intervals rather than large quantities at infrequent intervals. These systems may be said to be forms of fractional mixing of the particles of an ore, in that they aim to send to the final sample many thousands of easily mixed small portions, any one of which may not seriously affect the sample but which in the aggregate will approach the average value well within the limits of accuracy required.

A study or an examination of the sampling methods used in the United States shows that, in a large proportion of the plants, the theory of sampling has been given proper consideration, and many sampling plants have been built and are being operated on correct principles. It also shows that there is great variation in the application of many methods and a general lack of uniformity in carrying out certain details, which often results in a ridiculous waste of time and money and causes ore sampling to drift far from its true scientific and technical position to one of either guesswork, a too great dependence on the law of long period averages, or, in certain instances, to a plain case of matching wits.

These conditions are indicated by the fact that a method considered reliable in one plant may be considered unreliable in another, although the two plants may belong to one company; that much resampling and reassaying is considered necessary before an agreement is reached between the buyer and the seller; and that sampling often provides merely a means of settlement rather than a correct estimate of the contents of the ore. Therefore, today, as in many years past, there is the buyer who by accident or intent impoverishes the sample with too large a proportion of the lower grade, coarser particles, and the seller who screens and remixes his ores in order that the buyer may cheat himself.

Multisampling.

In many of the sampling plants that handle the more valuable ores are men who, although they refer with satisfaction to certain marvelously close checks in some resamplings, nevertheless take for granted that a large proportion of the lots received will necessarily and unavoidably show differences that will necessitate a second or third resampling. It is the custom in many plants to divide the sample at certain points in the process, and thus make what are known as duplicate, triplicate and even quadruplicate samples, each of which receives an entirely independent but similar treatment during the latter processes and is assayed separately. This is done for several reasons, one being that it furnishes a means for checking any gross error

in the succeeding operations, and another being the possibility of using an average of the results in making a settlement. In some agreements between buyer and seller it is provided that the difference between these multisamples be used as a guide in determining whether resampling of the ore is necessary. The necessity for resampling is sometimes decided on the merits of each particular case, or, in some localities, a certain agreed percentage difference or tolerance between an original and a duplicate is allowed before a resample may be demanded. In one instance, a 20% difference is considered a satisfactory check, but in the majority of such agreements a 10% difference automatically calls for a resample, whereas any difference less than 10% precludes resampling and forces a settlement on the basis of the original or an umpire assay. For example, a buyer working under a 10% agreement is satisfied as to the correctness of the sampling of an ore containing 5 ozs. of gold if one sample, the original, assays 5 ozs. and the other, the duplicate, assays either 4.54 or 5.50 ozs. In such a case the settlement would be based on the average of the second instance. With gold at \$20 per ounce, there would be a difference of \$9.50 per ton. Such differences are neither necessary nor desirable.

To appreciate these conditions more fully it must be realized that even with a lot of ore amounting to several carloads the division into these multisamples is usually made after the quantity retained for this division has been reduced to 500 lbs. or less. It seems proper, therefore, to criticize severely a sampling method that will not check the multisampling of 200 to 500 lbs. of ore closer than 10%. It is also proper to speculate on how much greater a difference might have developed had there been used for the check sample the entire lot of ore instead of the few hundred pounds. Furthermore, it should be borne in mind that even if these original and duplicate samples check absolutely, such checking does not prove the correctness of any previous part of the sampling process.

Proportion of Ore Retained for Sample.

It is unfortunate that, owing to limited storage room and to the length of time involved, it is not feasible for other than custom sampling plants to retain intact the whole tonnage of every lot of ore until final settlement. With smelting and milling plants, therefore, it is frequently the rule that, during the sampling, the bulk of the ore, the portion rejected, is taken directly to storage bins or beds where it immediately loses its identity through being mixed with other lots of ore, only a small part of the whole being retained for resampling and the settlement of possible disputes. In the case of high-grade ores, or of special contracts, some plants retain the whole lot. However, the prevailing custom is to retain a few hundred pounds in the case of ordinary lots and one-fifth of the lot in special cases. Montana has tried to protect both parties to the sale of ore by enacting a law compelling

every sampling plant to retain intact 2½% of every lot of ore until final settlement has been made.

The existence of a considerable difference between multisamples is not everywhere considered a disadvantage. It makes the matter of final settlement susceptible to delicate manipulation by both parties; at times it enables the seller to raise the price somewhat and at other times enables the buyer to pay a few cents less than he otherwise would. As the manager of one of the larger plants has aptly said, "Do not interfere much with these original and duplicate or resampling rules, as that is where we make our money."

The records of some sampling mills show that a system is possible whereby the ordinary difference between two samples will be well within the limits of the accuracy of the assay, say approximately 1%, and that a greater difference than this will be shown in less than 2% of the cases. To make such results general would mean the scrapping and rebuilding of many plants, but the annoyance and cost of such a change would be returned in many ways. Among the advantages would be that the doubt of the mine superintendent regarding the correctness of his returns would be eliminated, as would the difficulty of the smelter or mill superintendent in deciding whether his losses or gains in recovery were due to his metallurgical practice or to a careless or overzealous sampling foreman. There are few sampling-mill foremen who have not worked overtime trying to develop some system that would enable them to avoid during the current month the blame attached to the sampling department for the loss of metals in the metallurgical operations during the previous month, and frequently such foremen have been unable to locate the cause of discrepancy and have merely passed along the reprimand of the superintendent to the shovelers or other workmen with the remark: "Be careful not to get too much of the 'fines' in the sample; the superintendent says that we ran short last month."

Generally a foreman does not enjoy this state of affairs, and no one who has had experience with this hard-working and loyal class of workmen can seriously doubt that the adoption of more nearly uniform and more accurate methods of sampling will be enthusiastically welcomed by them.

(TO BE CONTINUED)

Briquet for Zinc Ores.—A special form of briquet for zinc ores, particularly suited to retort distillation, is patented by Otto Baltin, of Lipine, Germany. (U. S. patent 1,166,170.) The ore and reducing agent are formed into egg-shaped briquets which are so small that the sum of their exposed surface is many times that of the receptacle used in distillation. When charged into a retort these briquets have only one point of contact with each other, and expose practically their entire surface to the direction action of heat. Ample space is left between them for the easy escape of zinc vapors.

Present Situation in Tungsten Industry. What the Future Has in Store for Silver.

Better tungsten prices are inevitable. This was the opinion expressed yesterday by Lewis A. Jeffs, mining engineer, prominent in the tungsten properties of Idaho and Nevada. Mr. Jeffs is of the opinion that the buyers of tungsten ores have reached an agreement which has resulted in driving down the price of the concentrates and that by so doing they have put themselves in a very unfavorable position. In discussing the tungsten market Jeffs said:

"I firmly believe that better tungsten prices than those prevailing at present are inevitable and for the following reasons: To begin with there is apparently a combination among the buyers with the avowed intention of hammering down the price to be paid the producers. They have hammered down the price to such a point that at least three-fourths of the operators that have been shipping tungsten concentrates have stopped producing. I have been in touch with numerous operators recently both in Idaho and in Nevada and they are considering the advisability of suspending operations entirely.

"One of the arguments that the buyers have been making recently and which with the uninitiated has had considerable weight is the impurity argument. Tungsten concentrates contain a number of impurities. First among these is phosphorus. Just why this should be singled out and so much stress laid upon it is hard to understand for it can be removed by smelting with lime as in the basic Bessemer process. Another impurity is copper and still another is arsenic. Tin, sulphur and bismuth are also objected to.

"Producers should not forget, however, that not all of the buyers object to the impurities and when the demand for the new tungsten was heavy no objections were raised.

"Now the peculiar feature of the present situation is that with three-fourths of the producers in Nevada and Idaho and other western states closed down and with numerous operators about to close down a very small tonnage is being produced. In answer to the law of supply and demand a decrease in the supply in the face of a constantly increasing demand means higher prices.

"I am told on good authority that one of the largest companies in Nevada, the Atkins-Kroll Co., has discontinued operations at Osceola, Nevada. This is but one of the many straws that point to what may be expected in the near future in the producing field. A number of new mills that have been completed recently in Nevada have not turned a wheel and have been practically abandoned."

In 1915, according to a Survey report, there were 166,336 short tons of talc produced and marketed in the United States, valued at \$1,401,197. This exceeded the 1914 output by 15,248 tons and \$60,323 in value. The average price of the domestic talc marketed in 1915 was \$8.42 a short ton.

In a letter to a friend in Gilpin county, Colorado, U. S. Senator Charles S. Thomas discusses the future of silver. He ventured the prediction, at the time of the breaking out of the European war, that one of its ultimate and necessary results would be the re-establishment of silver as a money metal upon some general and fixed ratio with gold.

"I did this because I believed and still believe, first, that the effect of the war upon exchange in gold using nations would be magnified by a corresponding but more desirable fluctuation between gold and silver than it ever had. Second, because gold would disappear from the currents of trade in all the warring countries, and silver would very naturally fall into the vacuum thus created, being preferable to and perhaps an equally good basis for paper currency. Third and lastly, because the enormous cost of the war represented by debt of striking proportions would necessitate resort to silver as the only means of broadening the metallic basis for money and credit. If I am correct in this forecast, the intrigues of the money interests can only retard their operation; the movement cannot be avoided.

"I do not think the moneyed interests have had anything to do with the recent rise in silver or its more recent fall to 62½ cts. This is one of the spasmodic fluctuations in the value of the commodity, which are caused by sudden and temporary demand. I think these are liable to occur from time to time, resulting in a permanent rise of the level of market quotations. It is too early to predict a close of the war, and until that arrives, little if anything will be done for silver.

"When the war ends the total public debt of the belligerent and neutral European nations (who have been obliged to be at all times on a military basis at great expense), will be far in excess of a hundred billions of dollars. The annual interest upon this sum at 5% represents \$5,000,000,000, which, added to the cost of government operations, will mean an annual tax upon their producing masses of not less than \$7,500,000,000. This is much more than the total productive wealth of the countries concerned, and means repudiation, unless silver comes to the rescue of gold. Even then, the nations will have to stagger along under an awful load for many years, if they are ever to get out from under it. Between repudiation and payment in silver, the holders of these national securities will prefer the latter. I therefore conclude that the interests heretofore responsible for silver's demonetization will be found among the champions of that metal through the stimulus of self-interest."

By the systematic recovery of scrap tool steel, and following a plan of utilizing the material for the smaller sizes and shapes for which it is perfectly applicable, there is an opportunity in a mine repair and maintenance shop to save a great deal of tool steel.

Commonwealth Mine and Mill at Pearce, Ariz.

By W. A. SCOTT.

Commonwealth property at Pearce, Ariz., is producing 9000 to 10,000 tons of gold and silver ore per month, all of which is treated in the cyanide plant, illustrated herewith, which was built and equipped in 1913. The property is now under the management of A. H. Lawry, formerly of the Montana-Tonopah.

The two veins on the property have almost an east-west strike, and dip about 60° to the south, or toward the body of the isolated hill, which rises from a level plain. The Main vein, which is the best producer, is on a contact between rhyolite-breccia and andesite, although at the east end it is entirely within the andesite. The North vein is at the contact between andesite and sedimentary rock. Development and production are carried on through two incline shafts, reaching a

oil is used as fuel. The air compressor is steam driven, all other equipment about the mine and mill being driven by electric motors, current for which is produced by a generator, direct connected to a Corliss compound, condensing engine, developing 850 hp.

The ore is dumped from mine skips into a receiving bin, chutes from which discharge the ore into saddle-back, double discharge cars. These cars, operated by cable and counter balance, are hauled about 60 ft. and the ore dumped into a crusher bin of 650 tons capacity. This method of moving the ore from the shaft to the crusher bin is known as the C. W. Hunt Co. automatic railway system, which is much used at coal mines. The dry-crushing plant, below the crusher

CYANIDE AND OTHER SURFACE IMPROVEMENTS OF COMMONWEALTH MINING CO., PEARCE, ARIZ.

depth of about 1000 ft. on the dip of the veins. The work done shows a width of vein which varies considerably. It is 100 ft. wide in some parts of the mine. The ore body, which occurs in shoots and channels, is found next to the footwall in some parts and on the hanging wall in others; and the footwall itself is mineralized to a paying degree in some places. The gangue consists of quartz and calcite, carrying silver and gold in the ratio of about 1 oz. gold to 100 ozs. silver. It is said that manganese is associated with the gold and silver.

The new incline serves as the main working shaft, the old incline being used for handling tools and supplies. The pump station, on the 8th level, has triplex plunger pumps and one centrifugal, all electric driven, by which 1,000,000 to 1,500,000 gals. of water are pumped to the surface daily. This supply of water is used for mill work and other purposes. The 8th level, where the pump station is situated, is 423 ft. vertically from the surface. The 10th level is under water.

The source of power is a steam plant, for which

bin, contains a No. 6 K. Gates gyratory crusher, operated by a 100-hp. motor, by which the ore is crushed to 4-in. size; it then passes through a revolving screen, 12 ft. long, 40 in. diameter, having $1\frac{1}{2}$ -in. holes, and running 18 rpm. The oversize is re-crushed to $1\frac{1}{2}$ -mesh size by two No. 4 K. gyratory crushers. This $1\frac{1}{2}$ -mesh product is now delivered to a belt conveyor, 20 ins. wide, 274 ft. long, running 250 ft. per minute, on a 20° incline, whereby it is conveyed up to the sampling plant, where the ore is sampled with standard equipment. The next step is to carry the ore by a 95-ft. belt conveyor to the battery bins, it being distributed to the several bins by a self-propelling reversing tripper. These bins have a capacity of 800 tons, the ore discharging therefrom through six suspended Challenge feeders to the three 10-stamp batteries of 1550 lbs. each. The battery discharge is through 3 and 4-mesh screens to three 5-ft. Caldecott cones. The cone overflow passes to Dorr classifiers, the bottom discharge is feed for three 8 by 30 Hardinge mills. The Hardinge product goes to Dorr classi-

fiers. The Dorr sand discharge passes to one 4 by 20-ft. and two 5 by 22-ft. tube mills, which work in closed circuit; the Dorr overflow passing to a 38 by 12-ft. Dorr thickener. Here the pulp is thickened 2 to 1, and delivered to a 38 by 12-ft. Dorr agitator, which works in continuous series with nine 38 by 12-ft. Pachuca tanks. The material is discharged from the Pachuca to four 42 by 12-ft. Dorr thickeners, in which the counter-current wash is given. The tube mill product goes to Dorr classifiers. The pulp from the last Dorr thickener is passed to two 11½ by 18-ft. Oliver continuous filters, the pulp, after solution is taken out, passing to the waste dump. The cyanide solution is introduced in the Dorr agitators, using there, about 2-3 lb. to a ton of pulp.

The rich solution is first clarified by passing it through Merrill clarifying presses, having 36 by 36-in. frames; it is then pumped by two Buffalo single acting triplex pumps, having 8½ by 8-in. cylinders, to two Merrill precipitation presses, the zinc dust used in precipitating the metals being fed by Merrill feeders. The precipitates, being first dried in a steam drier, are fluxed and melted in two Donaldson tilting crucible furnaces.

The mill superintendent is C. G. Osgood, formerly superintendent of Montana-Tonopah mill. Other members of the operating staff are P. C. Lemmons, mine foreman; J. H. Tate and R. C. McGinnis, mining engineers; Ernest Hinrichs, master mechanic. There are 200 men on the payroll.

The Commonwealth Extension Mining Co. is developing ground adjoining the Commonwealth holdings on the east and southeast. This company is controlled by Bisbee stockholders, C. W. Hicks being president. J. S. Metcalf, formerly with the Commonwealth proper, is superintendent. The point at which a shaft has been sunk is near the base of the hill, and the 230-ft. level there has the same vertical depth as the 7th level in the Commonwealth mine. This shaft was sunk in andesite; water was struck at 230 ft., and a crosscut was being driven south for the vein. The property is equipped with a steam hoist and air compressor, and the company has high hopes of opening ore on the same contact that cuts through Commonwealth hill.

Suggestions for a Revised Mineral Land Law.

In response to an inquiry from a subscriber who desires to know what has been proposed in the way of new legislation for a revision of the mining laws of the United States, we append the suggestions of a committee appointed by the Mining and Metallurgical Society of America.

The following principal changes are suggested:

1. The survey of the public lands to be completed as soon as possible and all surveyed lands to be classified as

mineral or nonmineral according to the meaning of these terms now established by the United States statute or judicial decisions; such classification, officially announced, to be final until subsequently changed by the Government, and no such subsequent change to affect the rights of location under the former classification. Lands thus designated as mineral to be open to the location of mineral claims only and lands designated as nonmineral not to be open to the location of mineral claims until proved to contain mineral.

II. Mineral claims hereafter located to be 1320 ft. square—that is, 40 acres in size and square in form—with boundaries running north and south and east and west. Such claims, when located on surveyed land, shall be subdivisions of the survey sections. (Note—The location would be, of course, subject to all prior rights, surface or underground; and in many districts claims already located may leave only remnants of area not suitable in size or shape for separate locations. In such cases the practice now authorized by the Supreme Court, of establishing "imaginary boundaries"—that is, of claiming the full area of a claim and then disclaiming the parts of that area already occupied—would be followed. If such a location has no extra-lateral rights it will cause no special trouble. The purpose of this provision is, so far as existing rights do not prevent, to make mineral claims as easy to define as agricultural one.)

III. Any number of claims to be located by one person or association; and upon lands already surveyed and officially classified as mineral, the actual discovery of a valuable deposit not to be necessary to a valid location. Existing regulations concerning the marking, notice and record of location to be continued, with the additional requirement that within one year after the date of location record thereof shall be made in the United States Land Office of the land district.

IV. The present requirement of \$100 annual work upon each claim, to be amended to \$200, providing that \$300 per claim may be paid annually into the United States Land Office in lieu of the performance of such work, if any locator does not wish or is unable to meet this requirement. A person or association holding a group of contiguous claims to be permitted to do the assessment work upon one claim and thereby hold the group, but such work to be of amount equivalent to \$200 for each claim of the group. If any person or association perform assessment work in any one year to the value of \$200, or more, in excess of what is required to be done in any one year, the excess may be applied to succeeding years, provided, however, that no fractions of \$200 shall be considered for this purpose. Proceedings for patent to remain as now.

V. Subject to the existing extra-lateral rights of mining claimants or patentees, the holder or patentee of a mining claim located hereafter to have the exclusive right of possession and enjoyment of the surface held by him and of the minerals under it, bounded by vertical planes passing through surface boundaries of said land, but not the right to follow any mineral deposit beyond said planes. And the holders or patentees of claims heretofore located to have similar exclusive possession of all the mineral in said claims not covered by any existing extra-lateral rights.

VI. Notice of location of all mining claims made after the date of the passage of this act must be filed for record with the register and receiver of the land district within which the lands are situated within one year from date of each location, and unless final entry and payment be made for such claims within seven years after date of location, exclusive of the time covered by pending adverse claims, all rights thereunder shall cease.

Italian producers of or dealers in iron, steel, copper, brass and other copper alloys, German silver, lead, aluminum and scrap are ordered by the government to sell these only to army authorities. Contracts already made with other parties can only be executed by permission of the war office, with no claim for compensation if consent is withheld. Infringement of the order is punishable by fine and imprisonment.

The Right Use of Explosives in Mining Work

By E. M. WESTON.*

The miner's work on the Rand depends almost entirely on the right use of explosives. If their nature and their right use is not properly understood, then bad work is sure to be done, and accidents are sure to happen. It is not enough to know that gelatine explodes and breaks out the rock. We need to know what exploding means and how the rock is broken. It is not enough to know that a hole was too strong. We need to know why it was too strong, and why it was the explosion could not do what we expected. It will be quite easy to show that most of the miners on the Rand have wrong ideas about these subjects, and because of this lose money for themselves and others every day. This chapter is an attempt to explain these matters in as simple language as possible.

We would define an explosive as a solid or liquid substance or mixtures of substances, capable of being suddenly and more or less completely transformed into large volumes of heated gas, by means of heat or shock (as from a detonator or by a blow from a hammer) or both. This change from solid to gas is the result of chemical change such as that which causes a candle to burn in the air and disappear as a gas completely from our sight. A gas (such as air) when confined, especially where it is hot, exerts pressure or a push in all directions on whatever is keeping it in. A gas is made up of a number of infinitely small particles, so small that we cannot see them (as in the air we breathe). These always bound about everywhere and strike anything in their way, and the hotter they are the more they move and the harder they strike anything keeping them in and the more pressure or push they set up. In a drill hole when the explosive is suddenly turned into gas we have millions of small particles, at a great heat, bombarding the sides of the hole and setting up pressure, which, as we shall see later, gets up to over one hundred tons to every square inch of surface. There is no truth in the saying that "dynamite always strikes down."

Explosives are of two kinds, slow or rending, such as gunpowder, and high or quick, as dynamite. Gunpowder, when burning, turns or changes into gas in a one-hundredth part of a second (which is not very slow, after all). One part makes 200 parts or volumes of gas. When the explosion takes place this gas is heated to 2000 deg. and expands to 1500 to 2000 volumes, and it exerts a pressure of 11 tons on every square inch, so that if we had a hole 1 in. wide in a stope filled 10 ins. deep with powder, the explosive would try to force out the rock with a kick of $10 \times 11 = 110$ tons, suddenly applied in one-hundredth part of a second.

On the Rand we mainly use high explosives, such

as blasting gelatine. This turns into gas much more quickly, taking only one-twenty to fifty-thousandth part of a second to change into a gas. This is such a short space of time we cannot imagine it. When blasting brittle hard rock the more sudden the blow the greater the effect. One volume makes 6300 volumes of gas; but these, when the explosion takes place, are heated to 6000°, or hotter than any furnace, and then they expand to 16,000 volumes. This gas exerts the wonderful pressure of 117 tons on every square inch of the hole. So that in a hand hole 1 in. wide charged with 10 ins. (say, three plugs of $\frac{7}{8}$ -in. gelatine) the rock gets a sudden kick or push of 1170 tons applied so quickly that we cannot imagine it.

There are many explosives, but only a few of interest to us. These are nitro-glycerine, dynamite, gelignite, gelatine dynamite, and blasting gelatine. Recently some substitutes for these have been introduced on the Rand. Nitro-glycerine forms the chief constituent of the other four explosives. It is a thin oily liquid one and one-half times heavier than water, and is too dangerous to use by itself. Nobel found that certain earths absorbed it (sucked it up) and made it safe to use. Dynamite was the name he gave to the explosive he thus invented.

Gelignite is a mixture of nitro-glycerine, nitro-cellulose, potassium nitrate and sawdust. That is, it is a mixture of nitro-glycerine with things that absorb it and also help it to explode, and form gas themselves. It is 12% more powerful than dynamite.

Gelatine dynamite contains 80% of nitro-cellulose, with nitrate of potash and wood meal. It is 25% stronger than dynamite.

Blasting gelatine contains about 93% nitro-glycerine, which forms a jelly with an extract from cotton called gun-cotton, itself an explosive. It is also called nitro-cellulose and is a plastic jelly and is the best and most powerful explosive known for mining work. It is 50% stronger than dynamite.

The nitro-glycerine in the other explosives begins to evaporate at about 110°, and to come out of the explosive. It can generally be detected by its staining the wrappers of the cartridges. Any explosive in this state is most dangerous to use or to handle, and should be at once given up to be destroyed. Blasting gelatine freezes at about 34°. I have had it freeze in magazines on the Rand on winter nights. In this state it becomes hard. It should never be used in this state either, as it may not be properly exploded by the detonator in the hole, and is said to be liable to explode by the shock of handling roughly. Blasting gelatine can be safely burnt in small quantities, apart from the dangerous gases it gives out, but when it burns in large quantities, or if it be heated to 356° to 423° it explodes. High explosives can then be exploded in three

*Excerpts from *Practical Mining on the Rand*.

ways: by being heated, by a direct blow, and by the use of a detonator. A direct blow such as that of a hammer on an anvil will explode blasting gelatine, and it will also sometimes explode with rough handling. Accidents have been caused by tamping too roughly. At other times it can be cut to pieces in blasting the other holes of a round without being affected. The miner must remember to be always on the safe side. He cannot afford to take any liberties or he will pay sooner or later. When blasting gelatine is exploded by heat, it is only five times more powerful than gunpowder; but when exploded by a detonator it is 10 times stronger. An incomplete explosion from shock or burning means always the formation of much dangerous gas.

Detonators are filled with fulminate of mercury and chlorate of potash. Fulminate of mercury is made by the action of nitric acid and alcohol on mercury. It is the most powerful and sudden explosive known. When blasting gelatine is exploded three separate gases are given off: Carbonic acid gas, CO_2 ; carbonic monoxide, CO ; and nitrous oxide, N_2O . When blasting gelatine is burnt very much more N_2O and CO are given off, and these are most dangerous to life. For this reason the use of cheesa sticks made of sticks of gelatine burning on a stick has been forbidden.

Carbonic acid gas is not dangerous unless present in very large quantities.

Carbon monoxide gas is most dangerous even when present in only a few volumes in ten thousand. It is the gas which causes headache and loss of control of limbs, sickness and other symptoms, and if in large quantities death by driving oxygen out of the blood.

Nitrous oxide gas is also most dangerous, as it irritates the lung tissues and often causes death even after a lapse of time during which no injury is felt. Fortunately this gas is very readily absorbed by water, and if sprays and water blasts are turned on it should never be met with in large quantities. This gas can nearly always be smelt and felt in the nose and throat, thus giving warning of its presence. I have always held that many lives are lost in gassing accidents, in winzes or drives where the air has not been turned on, by a mistake on the part of the rescuers in their methods of work. Where there is an air pipe I think it unwise to try first of all to carry the disabled man out. The first effort should be to reach the air cocks and turn them on, or to break the pipe with a hammer or other tool. If this is done and the sufferer taken and laid in the escaping air, time is gained and the danger if the rescuer collapses is reduced. I need scarcely remind the miner of the need of at once having even apparently slight cases of gassing attended to.

Returning now to the subject of the detonation of explosives, the very sudden explosion of the fulminate in the cap sends a shock through the explosive, called the wave of detonation. This causes the solid particles of the explosive to unite in new ways to form gases. explosion is only quick burning, and if we could burn a candle in a fraction of a second it would act as

an explosive. This wave, travelling down to the charge, tends to lose its strength, and under certain circumstances, such as using a damp, weak detonator, or having air spaces or tamping between the cartridges, or poor explosive, it may be too weak to explode the bottom cartridge of a hole, and thus cause poor work and accidents. The end of the detonator should point always towards the bulk of the charge. In a properly loaded hole with No. 6 or 8 detonators, there is no fear that the bottom cartridges of any hole used, on the Rand will not explode properly, and there is no advantage, and many disadvantages, in the habit some miners have of putting the detonator in the bottom of the hole. The hole should be loaded as shown in the slips in the explosive cases. A still more dangerous practice has, I believe, led to several accidents, that is, putting the detonator in on the slant through the side of the middle of the primer cartridge. Too often, I am certain, the end of the detonator has protruded from the cartridge and been rubbed on the side of the hole while tamping or loading the hole and the miner has been blown up. To show that under proper conditions this matter of the loss of strength of the wave of detonation is not worth considering, I placed 18 $\frac{7}{8}$ -in. cartridges on end with the gelatine touching on the surface of a slimes dump and not packed in a hole. They all exploded perfectly. Do not try new fashions in loading holes. If bullringing in very long holes is feared, fill the bottom half with sand and blast in two sections, the top section first.

The miner must remember that even when in their box detonators absorb moisture very readily, and as they absorb moisture they lose their power. Hence, as few detonators as possible should be kept in the damp air of the mine. No doubtful or old detonators should be used in any circumstances. This is a very common cause of poor results owing to the explosive not developing its full force.

Fuse also absorbs moisture at the ends, which should always be cut off; damp fuse may hang fire or go out. Oil, which is frequently split in fuse boxes, dissolves the tar covering, and if it reaches the power retards the burning speed.

Norway exported 9910 metric tons of ferrosilicon in 1915, against 6144 and 6323 in 1914 and 1913, respectively. Iron ore and iron-ore briquette exports were 423,400 tons last year, against 467,800 tons in 1914, and 568,800 tons in 1913. Total imports of pig iron and finished steel were 302,200 tons in 1915, as compared with 223,200 tons in 1914 and 219,700 tons in 1913. Of these totals the pig-iron imports were 33,200 tons in 1915 and 32,200 tons and 30,700 tons in 1914 and 1913 respectively.

In tamping use a wooden tamping bar and a stemming material that is free from sharp bits of rock or anything that will cut the fuse. Be careful not to kink or double it over in the holes.

Relation Between Price and Volume in the Purchase of Mine Equipment

By MINER RAYMOND.

There are many laws governing business in general which the ordinary man takes for granted, giving never a thought to the whys and wherefores behind them, or as to just how closely actual facts uphold these rules. In a recent letter to the *Mining and Engineering World*, the writer made the statement that "more equipment is bought when prices are high, and when manufacturers are busy, than when a dull market renders the same equipment available at a lower figure."

An active curiosity as to how far available data would go toward proving the statement, led to an investigation, the results of which are presented herewith. Any extended analysis of cause and effect on this question would involve a discussion of many primal principles of economics, involving the laws of supply and demand, labor, and monetary problems; wherefore these notes will touch only such points as are pertinent to a comparison of the costs, market values, and amounts of equipment bought under varying conditions of business in general.

Before discussing the data assembled, the point at issue can be readily illustrated by the description of an incident experienced by many readers. The scene is laid in the office of the manager of the mine, smelter, factory or whatever you may choose as most familiar. Enter the superintendent, wearing on his face that do-or-die look common to the craft when the abstraction of money for new equipment is to be attempted.

"Say, Mr. Jones, we ought to have a new set of screens. Ours are all worn out and, anyhow, they're way out of date. We can't get half out of them that we should get to keep the other machinery going full. Now, John Smith & Co. have an awfully good new design—"

The manager replies in one of two ways. If business is slow, as before the war, he says: "Can't afford them. Business is rotten. Do the best you can till things pick up a bit."

On the other hand, if the question were asked at any time during the last year, the answer most probably would be: "All right, go ahead and get them in just as soon as the Lord will let you. We want to crowd out all we can while the market is up."

Multiply that incident by a large percentage of the number of mines, mills and factories in the United States, and you have the condition of the equipment market today. A strenuous demand for metals and metal products, primarily due in the present case to the great war induced a rising market. The producers bought new equipment to increase their output at the high prices. The manufacturers of equipment further stimulated the demand by large requisitions on the

producers for raw materials wherewith to build the equipment, and so resulted an increase of business all around, with the prosperity wave rolling higher and higher, until a high water mark shall be reached.

But the increased activity of the manufacturer created an increased demand for labor as well as materials, and higher wages followed. Thus with higher wages and more expensive material, the costs of manufacturing rose, and as always, the purchaser paid the piper. Again, the increased demand for equipment and urgent appeal for quick shipments caused the manufacturer to tack on a little better profit even to his increased costs, and again, it is the purchaser who pays the piper, for the machinery must be obtained so that he too may get greater profit by an increased output at the prevailing high market price. So it seems that volume of business and percentage of profit go hand in hand, a fact that will be referred to later in this discussion.

You may say that all this is very well in theory, but what are the real facts?

While the primary impulse that stimulated the present demand has been ascribed to the war, no mention has been made of the manufacture of munitions nor the production of materials therefor. The reason for leaving this branch of present activity out of consideration is that, while the situation is exceptional in its intensity, it is following the same cycle through which previous depressions and prosperities have revolved. Furthermore, the data here presented for comparative purposes is taken from the records of a firm manufacturing equipment for American firms only, with no munitions contracts whatever. The firm has an annual capacity of about \$1,500,000 worth of equipment for the preparation and mechanical handling of ores, coal and other raw and finished products.

As a basis for comparison, four curves were plotted to approximately the same scale as regards percentage of variation. The period covered is from Jan. 1, 1913, to July 1, 1916, by quarter-year intervals. The first curve shows the successive market prices of steel bars, tank plates and beams, the amounts taken being the average market values of all three for each quarter. Similarly, in the second curve, the prices plotted are the average costs per ton of five pig irons, namely: Pittsburg Bessemer, Basic Valley, Southern No. 2 at Cincinnati, No. 2 at Chicago, and No. 2-X at Philadelphia. These curves serve to show the variations in the manufacturer's costs of material, as minor items such as rivets, bolts, and so on, follow very closely the ups and downs of the major markets.

The third curve shows the variations in the cost of

labor for the same period. The first two curves are plotted from unit costs, i. e., per pound and per ton. To conform to these, the labor curve has been drawn through points representing the average monthly wage paid to the employes of the company. The total monthly pay-roll has been divided by the number of men employed, with corrections for the short month, February, and holidays.

These three curves cover the cost side of the question. It is interesting to note that, while more irregular, due to the fact that local conditions affect labor, while basic material costs are national, the general trend of the labor curve is very close to that of the other two above it. In other words, a rising cost of raw material is here accompanied by an increase in the wages of the men who work it into a finished product. High wages usually indicate plenty of work, which means that manufacturers are busy, and low wages indicate the reverse; but again the question arises as to what our data really shows.

Turning our attention to the fourth curve, in which the successive points represent the gross values of shipments for each quarter of the period, several considerations must be borne in mind. In the first place, the figures used are not the successive unit prices of a commodity as in the first three curves but represent the gross quarterly results of an effort to market that commodity. Sales problems have their effect. With business booming, undesirable inquiries are rejected, while in dull times it is "anything to keey busy." Again we must make allowance for limitations to factory output and, too, the amount of labor available to meet the demand for increased production, or, on the other hand, men held over to preserve an organization in slack times. Here, too, local conditions enter in as they may affect each particular manufacturer.

With these things in mind, we naturally look for greater irregularities in the rise and fall of the curve, and it is the rough course of the line that counts. Irregularities do appear in the fourth curve, but there is a very marked resemblance between this fourth curve and its predecessors, showing that shipments reach a higher total value when costs are up, than when cheap materials and low wages are the rule.

In a previous paragraph it was stated that bigger percentages of profit accompany better business. Admitting the truth of this, our point is proven in the case of one manufacturer at least, for a comparison of the four curves shows that there was more equipment sold when high costs of labor and material had raised the price of the machinery, and when these high costs themselves showed a greater general prosperity with consequently better profit, than when the opposite of these conditions was true. That is our original statement in extended form.

The writer's experience furnishes one interesting sidelight on this question. While it is true that the larger part of the buying is done at or near the top of the market, certain large corporations recognize and

take advantage of this law by purchasing and installing much of their equipment when the market is dull and prices low. The firms referred to are the large interests commonly called "Big Buyers." It is the poor man who pays the big price. It is the case of the old Negro with the leaky shanty roof—

"When it doan rain, Ah doan need no new shingles. When de rain come, shingles am too 'sensive."

A surprising amount of equipment is purchased on just that basis.

A Remedy for Limber Drill-Shanks.

Considerable time in the drilling of blast-holes with the heavier types of mounted rock-drills is wasted in straightening the hole which has become out of line. This may be attributed to several causes, among which are the long, limber drill shanks, the sudden passing from soft to harder formation, etc. Time is also wasted in starting the hole because the drill-shank, and often the carriage, are not rigid enough to keep the drill striking in one place. Thus two disadvantages tending towards considerable inefficiency are noted and it would

SECTIONAL VIEW SHOWING SUPPORT AT END OF DRILL CARRIAGE.

not be exaggerating to say that the miner loses 10% to 15% of his time in their behalf. A recent patent (No. 1,190,387) may tend to remedy this fault some by offering a support to the drill-shank below its socket. This support will be noted in the drawing as made up of parts numbered 13, 16, 18, 19, 20 and 23, the support being bolted to the end of the drill-carriage.

Electric Furnaces at Salt Lake City.

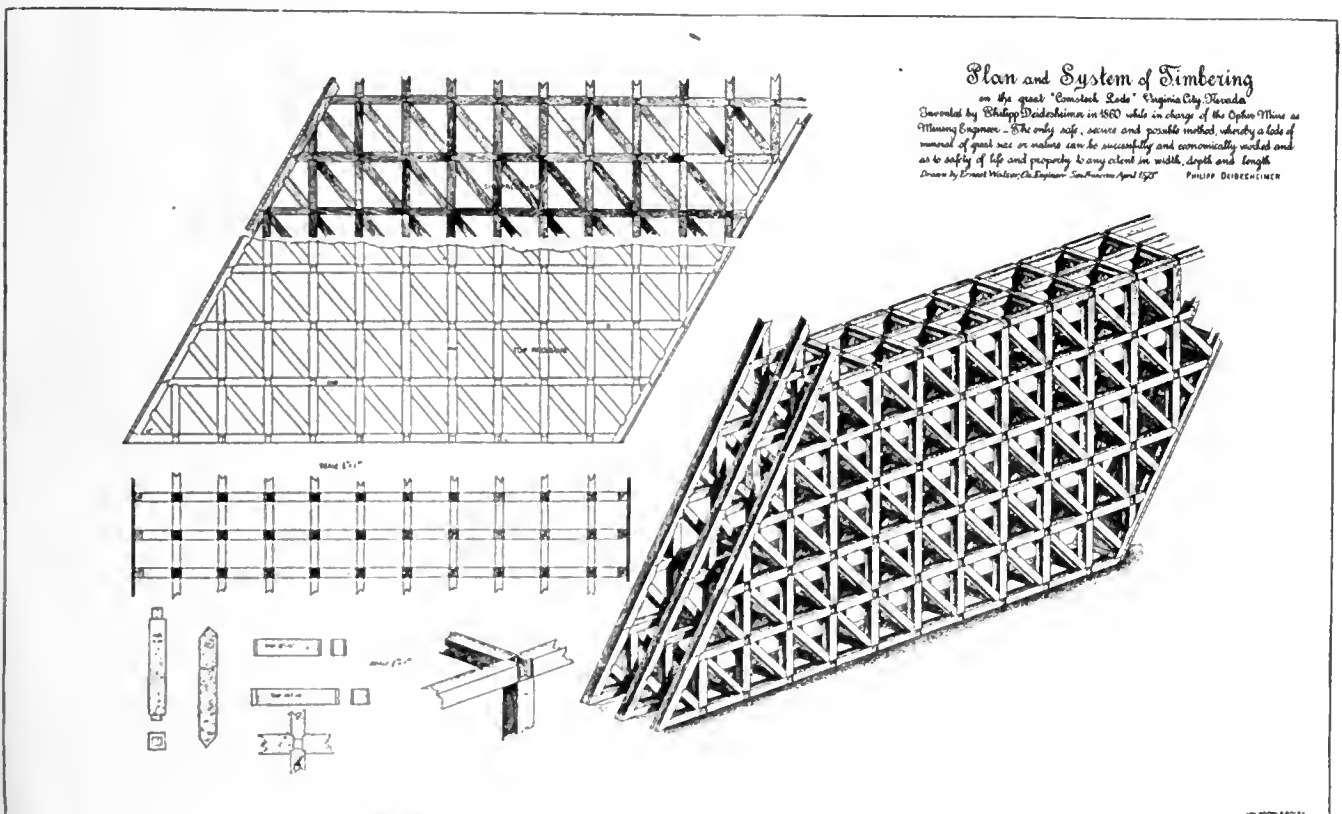

The Utah Iron & Steel Co., Salt Lake City, Utah, is considering the installation of electric furnaces chiefly for converting the scrap material available in that district into soft steel which may be rolled in its mills at Middale, near Salt Lake City. It is considering also the possibility of utilizing local ores for the manufacture of ferrotungsten and ferrochrome. It may install a furnace of as large as 12 or 15 tons' capacity, and perhaps two of the furnaces. The interests controlling the Utah Iron & Steel Co. also own the American Foundry & Machine Co., Salt Lake City, which is expanding its foundry business, and in that connection is shortly to install a 3-ton Rennerfelt electric furnace. Low-cost electricity and an abundance of scrap material make the electric furnace an attractive proposition against local high cost of suitable coke and high-cost pig iron.

Philip Dedesheimer, Inventor of the Square Set

EDITORIAL CORRESPONDENCE.

On July 21st at his home in San Francisco there passed away poor, old, almost forgotten, but hopeful that his mining claims would restore his lost fortune, Philip Deidesheimer, inventor of square set timbering. While there is some contention as to the first use of the square set in mining, it seems essentially true that the Comstock lode was the real home of the square set, and that Philip Deidesheimer was the father thereof. He met a truly great responsibility when he came to the Ophir mine on the Comstock

he was driving, rather than across it. In doing this he was following his practice at the drift mine. Then he drifted along the footwall and brought across the deposit another line of butting caps, parallel with the first. Light traces separated the two lines at the posts. Ore was in the roof, and he put the men to work on top of the sets he had stood on the level, just as he had previously done at his drift mine in those places where the ore went up above the lower sets. He had the posts of these upper sets stood in mortises cut

lode in 1860 to solve the perplexing problem that puzzled the best mining talent of the times.

An immense body of rich ore, 65 ft. wide, had been discovered in the Ophir mine, and although the best mining men in America were trying to solve the problem, they failed to get out the ore without losing more than they mined. The case was rendered all the more desperate by the remarkable richness of this large body of ore. At Georgetown, Cal., Philip Deidesheimer had been mining a drift deposit with success, carrying a face in places as wide as 125 ft. Some of the Ophir directors engaged him to go to the Comstock and solve the problem.

This problem Mr. Deidesheimer solved, as all the world now knows. Sensibly starting from the footwall he cross-cutted the deposit to the hanging, putting in two lines of butting caps, parallel with the crosscut

into the caps, directly over the posts on the lower floor. Soon the braces were made stronger and a crude square set was formed. These cross braces, or rather collar braces, were first nailed to the caps and posts. Later, bracket spikes were driven into the posts for these collar braces to rest on. Finally, the framing was changed so that the side brace rested on the post, as did the cap, resulting in a true square set, post, cap and girt.

As the slope increased in size and the ore continued to go up and up, sill timbers were used to stand the posts of the level sets on so as to give a better foundation to the structure, and then as the weight began to come, wall plates and angle braces were put in.

Complicated indeed, and some seem to think this was due to his Germanic descent. But this was not the case. Mr. Deidesheimer was solving new prob-

lems and progressing along new lines, for he was doing things that had never been done before under like conditions; in the end he accomplished a most remarkable feat, proving him to be the master miner that he was. Of course, like any one reaching into the unknown, Mr. Deidesheimer allowed himself a large factor of safety and rightly took every precaution so that this newly-devised system would not come to grief. Would not any good engineer do the same, no matter if the system did become elaborate? Mr. Deidesheimer, moreover, had rich ore to mine, and so he could not afford to lose any of it for a little less timber and a little less work. Therefore, he did things that with less rich ore could not have been done, and so no wonder that soon Deidesheimer's system of timbering was greatly simplified as it came into use under other conditions.

But think of the master mind of this miner who developed, step by step, under the stimulus of the heavy demands that the ore body was making on him, this marvelous system from the happy thought of lines of drift sets placed with their caps butting over the posts and with 2 by 4-in. sprags as collar braces between them, into a system by which he was able to carry a stope varying from 60 to 100 ft. wide and several hundred feet long, up to a height of 400 ft., without the use of any filling and without losing it. Of course, the walls along the Comstock were much less heavy than later when more ground was opened up along the lode, still the walls of the Comstock lode are none too strong at best. So it was quite a feat. The successful running of such a large and high stope for mining was not so rapid then as now and it is one that has never been repeated even in districts where the ore and the walls have been stronger, let alone under like conditions of weight. We now appreciate that it was not as good mining to use so much timber as it would have been to use waste filling concomitant with the taking out of the ore, but could any one other than a master miner have done this gigantic piece of stoping, treading new paths all the while? With a knowledge of mining, in no respect meager, we consider this the greatest mining feat ever performed in any time and in any land. It is America's real mining triumph.

Philip Deidesheimer, the man who did all this, the man who gave his great invention unfettered by a patent to mining, died in practical want at the age of 84 years. Had he patented his system of making individual timbers meet to form a series of square sets, and had the mining companies that have used his method of mining since that time paid him a royalty as meager as one-hundredth of a cent per ton for ore extracted, he would have been a millionaire years ago. Unselfish, confident in himself, engrossed with the pleasure of doing his task well, he did not patent his idea. So that during his declining years he found himself in need, although fortunes have been made time and again at mines where this mining method of his alone made successful operation possible.

Production of Bromine in the United States in 1915.

Bromine is made in connection with the manufacture of salt in the Saginaw valley in Michigan, in the Ohio valley in Ohio and West Virginia, and in the Kanawha valley in West Virginia. In Michigan bromine has been marketed in the form of fine chemicals, but as a result of the great increase in demand caused by the war in Europe, a large quantity is now being marketed as bromine itself. The bromine produced along the Ohio river, where salt and bromine occur naturally and where there is cheap rail and water transportation and an abundance of cheap coal and gas, has in part been exported to be made into fine chemicals. Here is an opportunity for the American chemist which should not be neglected.

The production of bromine in 1915 was 855,857 lbs., valued at \$856,307, an increase of 278,866 lbs. in quantity and of \$653,213 in value. The great increase in the production and especially in the value of bromine in 1915 is significant. The high price of bromine during 1915 and the first 5 months of 1916 was due, in part at least, to an unprecedentedly large demand from abroad, where it is said to be used in making asphyxiating gases. The comparatively low value per pound in 1915 indicated by the value of the total production as compared with that shown by the market quotations is due to the fact that considerable bromine was sold at prices stipulated in contracts made before the demand increased and to the further fact that the prices given are those fixed at the point of production and do not include cost of freight.

Increase in Value of Mineral Products of the United States in 1915.

The value of the mineral production of the United States in 1915, according to preliminary figures compiled by the United States Geological Survey, was approximately \$2,373,000,000, a gain of \$258,000,000, or more than 12% over 1914. The value for 1915 has been exceeded but once—in 1913—when a total of \$2,439,000,000 was recorded.

The metallic products reached the greatest value ever recorded, having advanced from \$691,000,000 in 1914 to \$987,500,000 in 1915—a gain of nearly 43%. The metals contributing most largely to this increase, their combined gains being 91% of the total, are as follows: Pig iron, increase, \$102,630,000, or 34%; copper, \$89,930,000, or 59%; and zinc, \$78,589,000, or 224%.

The value of the nonmetallic products in 1915 has been exceeded in 1913 and 1914 only, showing in 1915 a decrease of less than 3% from the preceding year. The figures for 1914 and 1915 are \$1,423,000,000 and \$1,385,000,000, respectively. The final figures for the value of the nonmetallic products in 1915 may be somewhat increased over the preliminary figures given.

The mining activities and output reported for the 6 months just ended show that 1916 promises to be a record-breaking year in the value of mineral products.

What the Mining Companies are Doing

Federal, Idaho.

Net earnings of the Federal Mining & Smelting Co. during May totaled \$174,934, as compared with \$146,709 in April and \$292,258 in the quarter year ended March 31, making the total for the first 5 months of this year \$613,901. The company is increasing the output of the Morning mine and equipping the North Star-Triumph group, on the east fork of Wood river, near Hailey, Idaho, with a 200-ton concentrator which will enable that property to begin production on a large scale. The annual report of the Federal Co. for 1915 showed an operating profit of \$155,930 in addition to income from other sources of \$352,663, a total of \$808,602. In 1914 the operating income was only \$189,093, and in 1913 it was \$419,932. Income from other sources was \$702,463 in 1914 and \$644,134 in 1913.

Standard, British Columbia.

The net profit of the Standard Silver-Lead Mining Co. for April was \$86,773, as compared with \$136,943 in March. As the operating expenses and other disbursements were practically the same both months, \$44,535 in April and \$44,000 in March, the lessened income of the company for April was entirely due to a smaller production of silver-lead ore and concentrates.

The summary of the financial statement for April, which could not be completed because smelter settlements had not been received on two cars, and which will be mailed to the shareholders of the company with their June dividend checks is as follows:

Receipts—	
Preliminary settlements, 729 tons.....	\$ 95,115
Zinc sales	26,847
Umpires	1,052
Boarding house	4,907
Store supplies	3,387
Total receipts	\$131,309
Disbursements—	
Ore production	\$ 21,586
Tramming	953
Milling	4,790
Power	489
General expense	918
Shipping and selling	1,639
Boarding house	3,351
Taxes	3,000
Insurance, etc.	1,036
Development	3,279
Aylard tunnel	2,254
Home office account.....	1,234
Total disbursements	\$ 44,535
Financial Statement—	
Net profit for April.....	\$ 86,773
Balance April 1, 1916.....	284,163
Total	\$370,936
Dividend No. 41.....	50,000
Balance April 30, 1916.....	\$320,936
Recapitulation for April—	
Cash in banks.....	\$201,263
Ore shipped, but not settled for.....	167,921
Total	\$369,184
Vouchers and payroll.....	48,247
Balance	\$320,936

Butte & Superior.

It is estimated that earnings of the Butte & Superior Co. for the 6 months ended June 30 were approximately \$6,000,000, or better than \$20 per share. Against this there was charged \$50,000 per month for sinking the new shaft. The total cost of this work will be about \$500,000.

Realizing that the spelter market for the past year or more has been abnormal, the management of Butte & Superior has been devoting much attention to the company's possibilities under 5 or 6-ct. spelter. Under normal conditions it is believed that the company can produce 150,000,000 lbs. of spelter per annum at a cost of four cents a pound or less. On 5-ct. spelter this would produce earnings of \$5 per

share; on 6-ct. spelter \$10, there being 272,500 shares outstanding.

Butte & Superior has on its books contracts for delivery of spelter at varying prices through September. On the last buying movement the company through its own sales department sold itself quite well up to Oct. 1. In addition, it has made some sales calling for shipment through December although the company has spelter available for delivery during the last quarter of the year.

In addition to spelter which the company sells direct a substantial proportion still finds outlet through the American Metal Co., to which company Butte & Superior sells concentrates.

The company has made no important sales recently. Earnings for the full year 1916 based on business actually done to date, should run close to \$40 per share.

Calumet & Hecla Outputs.

The June and 6 months outputs of the Calumet & Hecla and subsidiary mines compare as follows (in lbs. of copper):

	June.	May	April.	6 mos., 1916.
Ahmeek	2,280,923	2,070,551	2,158,451	11,461,195
Alhuez	922,584	953,069	929,960	5,137,907
Calumet & Hecla.....	7,217,837	6,865,907	5,709,434	38,157,582
Centennial	216,919	221,879	257,790	1,269,697
Isle Royale.....	1,138,811	1,128,461	950,580	6,035,766
La Salle.....	69,370	123,592	95,863	632,608
Osceola	1,571,714	1,775,222	1,783,470	9,791,439
Superior	286,124	331,432	385,034	1,758,465
Tamarack	515,331	620,314	559,374	3,446,425
White Pine.....	302,448	446,607	404,587	2,190,472
Total	14,522,064			79,881,556

Utah Copper Co., Utah.

The 6 months ended with June was the most prosperous 6 months in the history of the Utah Copper Co. Except for the last 6 months of 1915 it never produced as much copper in a similar period. At present production is running at a high point as shown by the June output of 18,000 lbs.

Utah's net earnings for the half year from its own operations must have been close to \$16,000,000, a figure never before even remotely approached. The first quarter contributed \$6,500,000 on a production of 36,564,000 lbs. of copper; the second quarter showed production of 48,500,000 lbs. and net of \$9,500,000. To this should be added \$1,250,000 received in dividends from Nevada Con., bringing final net up to \$17,250,000, or about \$16 per share on Utah's 1,625,000 shares. The inclusion of Utah's equity in Nevada Con.'s undivided earnings for the 6 months would, of course, serve further to enlarge the total.

The company's production and earnings for the first half of 1916 and 1915 compare as follows:

	1st half 1916.	1st half 1915.
Production, lbs.	85,000,000	67,100,000
Cost per lb.	7½c	7¾c
Net earnings	\$16,000,000	\$5,000,000
Nevada Con. dividends.....	1,250,000	625,000
Total earnings	\$17,250,000	\$6,525,000
Per share	16	4

Wolverine, Mich.

The Wolverine Copper Mining Co. ended its fiscal year on June 30 with earnings between \$12 and \$13 a share, against which there was distributed dividends of \$11 per share.

Higher wages and advances in the price of materials forced the cost of production at Wolverine up to about 10 cts. a pound for the 12 months about to end. There was a wide margin of profit, however, as the company sold its copper well ahead at high prices and received an average of about 21 cents a pound. The year's yield should approximate 6,750,000 pounds.

Labor shortage has resulted in keeping down production during the past few months. There has also been a falling

off in copper contents of the rock. In May the recovery was but 15.82 lbs. of copper per ton of rock.

Operations in detail were as follows:

	1915-16		1914-15	
	Production, lbs.	Av. yield.	Production, lbs.	Av. yield.
Six months ending Dec. 31	3,509,387	3,566,338
January	460,967	16.52	608,141	19.04
February	516,607	18.07	545,108	17.37
March	577,684	18.00	613,921	19.56
April	588,032	17.91	649,960	18.60
May	495,437	15.82	630,152	18.17

Wolverine has still considerable copper left in the old workings. When the bottom of the property has been reached the old stopes will be attacked.

Tonopah Belmont, Nev.

The combined condensed statement of the Tonopah Belmont Development Co. and the Belmont Milling Co. for the quarter ended May 31, 1916, shows as follows:

Received and receivable for ore, bullion, etc.	\$ 644,475.54
Mining, milling and administration expenses	322,393.20
Net earnings for quarter	\$ 322,082.34
Miscellaneous income	5,312.01
Total net income for 3 months ended May 31, 1916	\$ 327,394.35
Available Resources—	
Due from smelters and silver stored at 50 cts. per oz.	733,502.68
Due from others	9,775.04
Loans on collateral	250,000.00
Cash in banks	509,382.76
	\$1,502,660.48

Doe Run Lead Co., Mo.

The condensed balance sheet of the Doe Run Lead Co. as of Dec. 31, 1915, follows:

Assets—	
Plant property	\$14,417,547.43
Investments	18,000.00
Cash in sinking fund	1,000.00
Working and trade assets	246,805.74
Current assets	210,444.80
Due from affiliated companies	444,890.90
Deferred assets	4,500.00
Total	\$15,343,188.87
Liabilities—	
Capital stock	\$ 6,574,900.00
Gold notes	986,000.00
Current liabilities	190,253.53
Due affiliated companies	48,558.19
Reserves	303,371.88
Surplus	7,240,105.27
Total	\$15,343,188.87

Miscellaneous Company Notes.

Kerr Lake Mining Co. produced 237,942 ozs. of silver in June.

The Iron Cap Copper Co. in May produced 172,422 lbs. of copper at a cost of 12.24 cts. per pound. Net earnings were \$28,124, exclusive of construction.

Spelter can drop to 6 cts. a pound and Butte & Superior Mining Co., the world's largest individual producer of spelter, can show earnings of between \$10 and \$12 per share. These estimates have been made by officials of the company after close study of operating statistics.

The Utah-Apex Mining Co. made a new record in May with earnings of \$162,476, which is nearly \$10,000 in excess of previous estimates. Earnings for the 5 months ended May 31 compare as follows: May, \$162,476; April, \$152,307; March, \$107,936; February, \$82,036; January, \$96,009; total, \$600,764.

The June copper production of the East Butte Copper Co. was 1,639,560 lbs., a new high monthly record, compared with 1,517,000 lbs. the previous month. Production by months thus far this year follows: January, 1,060,000 lbs.; February, 1,277,160 lbs.; March, 1,306,900 lbs.; April, 1,501,000 lbs.; May, 1,517,000 lbs.; June, 1,639,560 lbs. The June output of silver was 41,503 ozs.

Directors of Mass Con. Mining Co. have declared an initial dividend of \$1 a share, payable Aug. 15 to stockholders of record Aug. 5. This dividend will call for \$100,000, there being 100,000 shares authorized, all of which are outstanding. On Jan. 1 last the company had balance of assets amounting to \$213,361 since which time operations have shown substantial profits ranging from \$17,000 in January to \$66,000 for May, the esti-

mated profits for past 6 months being \$225,000. June profits are expected to be equally as large as for the month of May. Present production is about 450,000 lbs. refined copper monthly compared with average monthly production for 1915 calendar year of 390,000 lbs., an increase of 15%.

At the first annual meeting of the Greater Miami Copper Co. at Miami, Ariz., the following directors were elected for the coming year: Thomas Wakefield, Sr., Frank Kuren, W. H. Piggott, H. W. Adams, F. E. Pearl, N. E. Milford, Joseph Perry. The officers elected were N. E. Milford, president; Joseph Perry, vice-president; W. H. Piggott, treasurer, and H. W. Adams, secretary. A contract was let to drive in 150 ft. on the new tunnel.

The bid price for the stock of the Union Sulphur Co. last week was raised to \$11,000 per share. By two successive advances of \$1000 each the price was raised from \$9000, the highest prices ever recorded for a security in the United States. The company, which is the largest individual factor in the production of sulphur in the world, has been paying dividends at the rate of 100% monthly, or 1200% per annum. It has a small capitalization—\$400,000—of which \$200,000 is outstanding.

May earnings of the Eagle & Blue Bell Mining Co. were exceptionally large—\$28,000—compared with \$16,956 in previous month. Present earnings are more than double those of last year of \$143,345 and \$121,536 in 1914. The output has been sold ahead at high prices for the remainder of 1916. The company is now in a position to declare another dividend and it is probable one will be ordered within a month. In 1915 two dividends—10 cts. in August and 5 cts. in December—were paid, but no payment has been made this year.

A close estimate of the U. S. Smelting, Refining & Mining Co.'s earnings on its common stock, for the 6 months' period ending June 30, is expected to be about \$15 per share. The net earnings for May were \$1,300,000; June is expected to show net of \$1,200,000. This is expected to bring the net earnings for the second quarter in the vicinity of \$4,000,000, which, with the \$3,000,000 earned during the first quarter, will make a total for the 6 months of \$7,000,000 in round figures. The estimate for 1916 shows earnings for the first 6 months of better by \$1 than was earned on the common stock during the entire year 1915. Contrary to the general belief, less than 20% of these earnings have been derived from property in Mexico.

Ore reserves of the Granby Con. Co., B. C., at the end of the present year, it is expected, will have been increased by fully 3,000,000 tons above the 18,000,000 tons of 1.8% copper ore. From the product handled at the Anyox smelter there has been secured nearly an ounce of gold and between 20 and 30 ozs. of silver per ton. These precious metals values have been sufficient to pay the cost of the transcontinental haul of the blister copper to the Nichols refinery in New York and all eastern expenses. In brief, the only charge against the Anyox copper itself has been from mine to and through the smelter; the balance has been more than met from gold and silver receipts. In its Bonanza property Granby is understood to have a very good asset upon which, to date, only development work has been done. The Midas mine in Alaska should start shipments of ore to Anyox during the current month.

The Bingham Mines Co. earned for the months of April, May and June a trifle over \$40,000, May being high month with \$15,426. For the same quarter Eagle & Blue Bell earned about \$55,000, May also being the high month at \$27,957. Allowing for an equity in Blue Bell earnings of 75%, which is the amount of Bingham's ownership, total profits available for Bingham in the second quarter were nearly \$82,000. Although this is best showing ever made by either property, it would have been materially enhanced were it not that Eagle & Blue Bell shipments were reduced to 50 tons a day on June 15 by the American Smelting Co. A large number of bonds have recently been converted so that of the original issue there is now outstanding only \$250,000. Last year \$87,000 were purchased and since then \$250,000 have been converted. There is now \$50,000 sinking fund cash in treasury for the purpose of retiring another block of bonds.

American Mining Congress; 19th Annual Meeting

LA SALLE HOTEL, CHICAGO, NOVEMBER 13, 14, 15 and 16, 1916.

Unusual efforts are being made to make the 19th annual meeting of the American Mining Congress, to be held in the Hotel LaSalle, Chicago, Nov 13-16, 1916, one of the most successful in the history of the organization.

The official call has been issued, and, as usual, the convention will be composed of the active and associate members of the Congress and members of affiliated organizations, specially invited guests and duly accredited delegates appointed under the authority extended for the appointment of delegates.

The American Mining Congress is an incorporated body and only active members of the organization can legally vote upon such matters as relate to the permanent business affairs of the Congress, the control of which is lodged in a Board of Directors consisting of thirteen members, who are elected to hold office for three years.

The Board of Directors is largely guided by the

CARL SCHOLZ,
President American Mining Congress.

resolutions adopted by the Congress in annual session, and will maintain a working force continually engaged in carrying out the directions of the Congress.

The convention will be an open forum for the discussion of any question which the program committee may present or the resolutions committee shall determine to be of such importance to the business of mining as to warrant its consideration.

Any member of the convention may introduce by written resolution any question related to mining. All resolutions are referred without debate to the Committee on Resolutions.

The Resolutions Committee is composed of one member from each state represented in the convention, such member to be selected by the delegation from each state present on the opening day of the convention.

A general meeting of the Congress will be held on the morning of each day of the convention, at which only subjects of general interest will be considered.

These subjects will be grouped under the heads of Safety, Efficiency and Conservation, and will occupy the morning session of each day of the convention.

In order that delegates may attend the discussion of only such questions as are of direct interest, the afternoon and evening sessions will be divided into sections, each giving consideration to its special problems. By this plan each delegate may attend that section which is considering the subject which is to him of greatest interest.

A program of varied interest and speakers of national prominence or special knowledge of the several subjects will be provided. The more important papers will be printed and distributed in advance of the sessions and each paper will be followed by short discussions of the subject presented.

Co-operation for better conditions is to be the keynote of the convention. A better understanding between employers and employes is one of the most important subjects for consideration. The truth of the issues involved is to be told plainly but without offense. Conditions must be understood and faced if remedies are to be provided.

Co-operation is the great need of the mining industry. The great purpose of the convention will be to inaugurate plans by which all branches of the mining industry may work together for the solution of common problems.

The entertainment committee will provide unique and interesting functions for such time as is not occupied by the serious work of the convention. Trips to various points of interest, a smoker and banquet will be arranged and every effort made looking to the enjoyment by the members of the greatest meeting of mining men ever assembled.

The Situation in Silver.

The principal factors governing the silver market of late has been the selling by China and the absence of India as a buyer. London continues to absorb all the silver offered in the market, but its stocks remain abnormally low.

The increased business of photographic goods manufacturers is responsible for an increased domestic demand, the Eastman Kodak Co. consumption totaling about 4,000,000 ozs. annually. The largest individual user is said to be the International Silver Co., whose wants total approximately 3,000,000 ozs. annually.

In his weekly discussion of silver market conditions during the past week, S. R. Wagel says:

The market during the week was dominated by other factors than the Mexican situation; as recent developments point to an amicable settlement, there is no support to the bullish attitude. Early in the week, the market advanced very slightly, but since then prices have been dropping. There is no demand in London, and the stock is comparatively heavy, the total on Thursday last being £1,300,000. There has been a slight addition to the stocks in Shanghai, because the Chinese are continuing to melt additional amounts of small coins, and adding to the stock of sycee.

The exchange markets in Shanghai and Hong Kong are very dull. The speculators are said to be fully covered for the moment. Although there is a likelihood of the additional shipment being made to Bombay, on account of the Government of India, the market has not exhibited much strength. The Bombay market was active late in the week, and fairly large amounts were sold in London. These sales have been responsible for the drop in prices.

The bank of France lost during the week, 1,649,000 francs of its silver reserve; the total of silver with the bank now amounts to 343,939,000 frs. as against 638,875,000 frs. previous to the war.

England and Zinc Smelting.

The question of zinc smelting in England is discussed in a recent issue of the London *Times*. It is a problem which the English government has shown a marked disinclination to tackle so far. The proposals recently submitted by a deputation of Australian producers are on the same general lines as those submitted to the government a year ago. They cover a proposal to erect smelting works in England to treat about 60% of the Australian output. British capitalists are quite willing to put up the works if the government will protect the new industry from German dumping after the war. Up to the present the producers have not been able to obtain any guarantees from the government on this subject because of the fiscal issues involved.

But the producers are not wedded to any particular

scheme, so long as the one adopted ensures the Empire's independence of foreign sources of spelter supply in the future. In view of the political issues involved, they would be quite prepared, if the government desires not to raise controversial fiscal questions in wartime, to entertain a proposal that the State shall erect works of its own and make a contract for the supply of concentrates with the producers over a period of years. Nearly two years have elapsed since this question was first raised, and a great deal of public money has been wasted on buying spelter at very high prices owing to the government's procrastination. It must decide the matter sooner or later, and it would be sheer folly to delay action any longer. Zinc smelting is a very technical subject, and therefore, if the best results are to be obtained, the necessary works should be erected at once, in order that German competition after the war may be satisfactorily dealt with.

A New Method of Mine Flotation.

A new method of flotation has evidently been discovered, but of a destructive rather than a constructive nature as are pneumatic and oil flotation. This was noted in the prospectus of a recently formed company in Canada, the Rognon Gold Mines Ltd. The company is capitalized at \$2,500,000, par \$1. The promoters and vendors of the property have received 2,000,000 shares. Of the 500,000 shares of treasury stock left 100,000 are now being offered the public at par \$1, or in other words \$100,000 is going to be used for development. A company formed in May, 1916, is handling the stock of this company.

The promoters have realized that offering the public only \$1 for every \$20 they receive is not much of a drawing card. The public should be satisfied with the percentage of the profits which they receive (and which the promoters consider fabulously large); but the promoters are kind to their investors so give the investors in their stock a guarantee. They will refund their money to them at the end of 15 years, if it is not paid in dividends. This will probably be done by selling the public another 100,000 shares of the promoters' 2,000,000 shares or else the 100,000 shares will simply be deposited with the trust company as security.

In short the promoters will be out nothing but a big bluff on their guarantee. Of course the trust company may fail at any time and not be able to pay its guarantees, but that is not brought to the mind of the investor. What relation exists between the mining company, the trust company, the security company, promoters, vendors and other probable companies recently formed for benefit therein, is something considered as absolutely unnecessary for the public to know of. At least he would probably have a good time trying to break this flotation bubble and see what was inside.

Laboratory and Practice.

Experimental work carried on under the usual laboratory conditions has frequently proved an unreliable guide as to the commercial possibilities of a process. In the treatment of ores laboratory experiments are important but the results obtained from them should be corroborated by tests on a commercial scale and under the same conditions as to the details of treatment as will be met with in practice.

In commercial operations, the object sought is profit. If the process selected to treat an ore can not be operated profitably then that process is a commercial failure, no matter how successful it may be from a purely scientific point of view. Practical details affecting the cost of operation are at least of equal and sometimes greater importance than the percentage of extraction attained. In small-scale laboratory tests, not only is the item of cost on a commercial scale difficult to estimate accurately, but extraction results also are very apt not to accord with those obtained when operations are carried on under commercial conditions. It is essential, therefore, that a balance be struck between cost of operation and efficiency of operation so that the greatest possible profit may be realized. Laboratory tests and investigations may lead to the development of methods of greater efficiency, but cost of operation can usually be most accurately checked only by commercial-scale operations.

The most efficient work in the cause of safety must be done by methods which will constantly keep before the mind of every employe that upon him rests an individual and personal responsibility. It is felt that efficiency in safety can only be attained by education and constant agitation of the subject and the hearty co-operation of the employe with the management. This fact implies that the management should show its willingness to do its part in the installation of guards and appliances.

Let us be thankful that we are optimists, that we are working for the interests of the world's most unquenchable optimists—the American metal miners and prospectors. Their courage never fails them, they are undaunted by a bad run of luck. They know that night is always followed by dawn. They cheer themselves and all who come in contact with them.

The weakness in copper prices last week led to a larger demand and much more cheerful sentiment among the producers. Contracts for fairly large tonnage for last quarter delivery were closed last week at 23 cts. These sales were made by the smaller producers.

A copy of the index to Volume 44, covering the first half of 1916, has been sent to all subscribers regularly receiving it. It will be sent to all other subscribers desiring it.

PERSONAL.

Chas. Butters, Oakland, Cal., was in Tonopah, Nev., last week.

Charles H. Moyer has been re-elected president of the Western Federation of Miners.

F. J. Fols, consulting oil geologist, has opened offices in the Gallais building, Tulsa, Okla.

Maurice W. Bacon, Spokane, Wash., president of the Hudson Bay Zinc Co., is in Salmo, B. C.

James Davis has been appointed superintendent of the Calaveras Con. Mining Co., Melones, Cal.

G. A. Gordon, superintendent of the Standard Silver-Lead Co.'s mill, is in Winnipeg, Manitoba.

Charles Knox, president of the Montana Tonopah Mining Co., Tonopah, Nev., is in Oatman, Ariz.

Waldemar Lindgren is on professional work in the western states and will return to Boston about Sept. 1.

Ernest Clifford Wood, civil and mining engineer, has reopened his office at 401 Empire State building, Spokane, Wash.

J. W. Brown is now secretary-treasurer of the Isabella Mines Co., Victor, Colo. He succeeded D. W. Thatcher.

Robert W. Wooley, director of the mint, has resigned to assume charge of President Wilson's publicity campaign committee.

Fred S. Porter is with the Canadian Klondike Mining Co., Dawson, Alaska. He was formerly located at Treadwell, Alaska.

Frank L. Sizer, mining engineer, San Francisco, Cal., has been in Kingman, Ariz., relative to inspecting some property in the Chloride district, Arizona.

F. W. Bradley, San Francisco, Cal., president of the Bunker Hill & Sullivan Co., has been inspecting the company's property and new smelter at Kellogg, Idaho.

Newton W. Emmens, northwestern representative of the Kusla Spelter Co., with zinc plants in Oklahoma and Pennsylvania, is making his headquarters in Spokane.

E. W. Klumph, mining engineer, recently graduated from the Michigan College of Mines, Houghton, Mich., is now in Butte, Mont. He is accompanied by I. T. Field.

J. R. Nicholson and E. N. Vanderlip, Globe, Ariz., have gone to Anchorage, Alaska. They will spend about a year prospecting in the Broad Pass district on Indian river and other areas.

Frank Watson, a former operator at Rossland, B. C., and more recently interested in developing the coal fields of Alaska, has removed his headquarters from Seattle, Wash., and is now in Rossland again.

Dr. A. N. Talbot, professor of Municipal and Sanitary Engineering, in charge of Theoretical and Applied Mechanics at the University of Illinois, who last year was honored by the University of Pennsylvania with the degree of Doctor of Science, has this year been made the recipient of the degree of Doctor of Engineering by the University of Michigan.

Walter Douglas, general manager of Phelps, Dodge & Co., has been made vice-president and will have offices in New York. S. W. French, former general manager of the Copper Queen, will succeed him and the offices will be moved from Bisbee, Ariz., to Douglas, Ariz. G. H. Dowell has been made general manager of the Copper Queen and A. V. Dye will be assistant general manager for Phelps, Dodge & Co.

OBITUARY.

John Francis Campion, vice-president of the Denver National Bank, Denver, and director of the Carbonate National Bank, Leadville, Colo., passed away on July 17, 1916, at Denver, Colo. He was born on Prince Edward Island, Dec. 17, 1849. In 1862 he went with his parents to Sacramento, Cal., and later joined the Union forces in the Civil war. After the war he returned to California and was interested in the White Pine mine in California. He lost there and went to Eureka, Nev., where he reclaimed his losses and then purchased the Pioche-Phoenix mine, Pioche, Nev. In 1879 he went with the rush to Leadville, Colo. The Elk and Lucy B. Hussey mines were among the first he located and developed in the district. The IbeX Mining Co. was formed by Mr. Campion, associated with A. V. Hunter, G. W. Trimble, Eben Smith and Charles Cavender. The present Little Jonny shaft was sunk and in 1893 the company began producing under the general management of Mr. Campion. He was general manager of the company at the time of his death and did much in financing many enterprises aside from mining in Colorado.

Charles William Henry Kirchhoff died in New York City July 20 at the age of 64 years. He was editor-in-chief of the *Iron Age* from 1889 until 1910. He was connected with the publication for 29 years and was prominent for years in the mining industry, being at one time president of the American Institute of Mining Engineers. Mr. Kirchhoff was born in San Francisco, Cal., and was graduated from the Royal School of Mines in Clausthal, Germany, in 1874. For the next 3 years he was chemist of the Delaware Lead Refinery in Philadelphia, and then joined the staff of *Metallurgical Review* as assistant editor. In 1878 he joined the *Iron Age*, with which he remained until 1881, when he became managing editor of the *Engineering and Mining Journal*. Three years later Mr. Kirchhoff returned to the *Iron Age*, being successively associate editor and editor-in-chief. Mr. Kirchhoff was the special agent of the U. S. Geological Survey for the collection of statistics of the production of lead, copper and zinc during 1883-1906. He was a member of the American Iron and Steel Institute of Great Britain, the American Society of Mechanical Engineers, the Verein Deutschen Eisenhuettenleute, and an honorary member of the Franklin Institute of Philadelphia.

SCHOOLS AND SOCIETIES.

American Association of Engineers.—The National Board of Directors of the American Association of Engineers has adopted a resolution as follows: "Resolved, That all applications for membership received prior to Sept. 1, 1916, be accepted (provided the applicant has the required qualifications) at the present rate of no initiation fee and \$10 per annum membership dues." According to an amendment of the Constitution adopted at the May convention an initiation fee of \$2 shall be charged after 1000 applications have been received. It is estimated that this number will be reached before Sept. 1, 1916, but it was agreed to offer all engineers an equal opportunity to join at the present rate until then. The initiation fee will be increased \$2 for each additional 500 members secured after 1000. The qualification committee of the association has under advisement a revision of the qualification record which will restrict certified membership to a greater degree than heretofore. The association has grown from 30 members to 891 in 14 months by active, aggressive effort in promoting the welfare of engineers and engineering along commercial lines.

American Electrochemical Society.—The fall meeting of the Society will be held in New York city on Sept. 28, 29 and 30, 1916, of the week of the Second National Exposition

of Chemical Industries. The outline of the program is as follows:

Wednesday, Sept. 27, evening: General reception, with registration, at the Chemical Exposition, Grand Central Palace.

Thursday, Sept. 28, forenoon: Reading and discussion of papers. General subject: "Made in America."

Afternoon: Visiting the exposition.

Evening: Complimentary smoker. An invitation will be extended to the members of the American Chemical Society and other visiting chemists and engineers.

Friday, Sept. 29, forenoon: Reading and discussion of papers.

Afternoon: Visiting the exposition.

Evening: Subscription dinner-dance.

Saturday, Sept. 30, forenoon: Reading and discussion of papers; possibly an excursion.

Afternoon: Visiting the exposition.

The arrangements for the New York meeting are in the hands of the New York Section of which Dr. Colin G. Fink is chairman and J. Malcolm Muir, 239 West Thirty-ninth street, New York, is secretary.

NEW PUBLICATIONS.

Spirit Leveling in West Virginia. By R. B. Marshall. Washington, D. C., U. S. Geological Survey. Bulletin 632; pp. 168. For sale by Mining World Co., 20 cts.

Includes a description of all bench marks and lines run since 1896. The altitude of each bench mark is given.

Talc and Soapstone in 1915. By J. S. Diller. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. II:9; pp. 4.

Prices, production, imports and general conditions are reviewed by states and countries.

New Jersey Department of Conservation and Development, Annual Report for 1915. Trenton, N. J., New Jersey Dept of Conservation and Development. Annual Report, 1915; pp. 77; illustrated.

Separate reports are given by the state geologist, forester and fire-warden.

Abrasive Materials in 1915. By Frank J. Katz. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. II:10; pp. 6.

The customary annual review of the production and market conditions during the year. Each abrasive material is considered separately.

Graphite in 1915. By Edson S. Bastin. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. II:11; pp. 13.

The production and conditions of the market are reviewed in general for the United States and also by states, with information on the world's production and imports.

Triangulation in California, 1913-1915. By R. B. Marshall. Washington, D. C., U. S. Geological Survey. Bulletin 614-C; pp. 60; illustrated.

The work is taken up by counties and the location of each triangulation station is described. In tabulated form the azimuth of each station is given with respect to other stations, as also is the distance from one station to another.

Potash Salts, 1915. By W. C. Phalen and W. B. Hicks. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. II:12; pp. 39.

Potash until the past year has been produced to practically no extent in this country. The import of this material is reviewed. For the greater part information is given on the nature of substances, including minerals, from which potash may be obtained. The occurrence of deposits of such materials is also gone into with possible methods which might be used for extracting the potash. Chemical methods for the

qualitative and quantitative analysis of potash are given in a practical manner

Microscopical Determination of the Opaque Minerals. By Joseph Murdoch. John Wiley & Sons, New York. Book; pp. 165; illustrated. For sale by Mining World Co.

A more minute investigation of substances is often necessary than can be attained with the eye, chemistry or small lens. The transparent minerals may be studied by use of polarized light and the microscope; petrography; the metals by reflected light, metallography and this third branch of studying opaque minerals is now being recognized as of importance, and the study called mineralography; in which reflected light is of necessity used with the microscope. Methods of procedure in using the microscope are first given, with the proper methods for preparing the specimen to be examined. The system of classification is then gone into and the phenomena exhibited under the microscope described. These phenomena or peculiarities are of both a micro-physical and micro-chemical nature.

Coal Miners' Pocketbook. McGraw-Hill Book Co., New York. Book; pp. 1172; illustrated. For sale by Mining World Co. \$4.

The book was formerly known as the Coal and Metal Miners' Pocketbook and consists of the usual contents of a handbook, namely, principles, rules, formulas and tables. The aforementioned information is treated under separate headings as Weights and Measures; Mathematics; Surveying; Mechanics; Strength of Materials; Concrete; Masonry; Wire Rope; Power Transmission; Specific Gravity; Weight and Other Properties of Materials; Hydrostatics; Hydraulics; Heat and Fuels; Boilers, Steam Engines; Compressed Air; Electricity; Internal Combustion Engines; Prospecting; Mining; Explosives, Supporting Excavations; Hoisting; Haulage; Ventilation; Mine Fires; Preparation of Coal; Safety and First Aid; Trigonometric and Surveying Tables and a Glossary of Mining Terms.

Making Money Make Money. By H. L. Barber. A. J. Munson & Co., Chicago. Book; pp. 315. For sale by Mining World Co. \$1.50.

A duplicate title of the book might justly be given as A Primer of Investing. It has been the intent of the author to show the wage-earning class how to invest their capital to bring more than merely a small interest amount. There are 20 separate discussions, or discourses, as they are termed. The general idea in each has been to put facts in front of the reader which will make him see the folly of putting his savings out on a loan bringing in a small amount as interest and at the same time permit the borrower to reap a much larger percentage as profit from the loan. He advocates the investment of savings in an enterprise to reap the benefit not only of the interest you obtain, but also of the profits which the borrower formerly received from the fruits of your savings and labor. In other words he advises one to invest and make your money make money and not merely interest. He further points out how this policy may be started with small sums.

PATENTS RELATING TO MINING.

Electric Furnace. Peter Eyer mann, Witkowitz, Austria-Hungary. (1,189,356; filed Dec. 5, 1912.)

Process of Treating Metalliferous Materials for Roasting, Reducing, Sintering, and Like Processes. Friedrich Carl Wilhelm Timm, Hamburg, Germany. (1,189,313; filed Oct. 30, 1913.)

Titaniferous Products and Method of Producing the Same. Louis E. Barton, Niagara Falls, N. Y., assignor to the Titanium Alloy Manufacturing Co., New York, N. Y. (1,189,229; filed Sept. 11, 1914.)

Apparatus for the Separation of the Sand and Water Raised in Dredging Gravel. Leon Désiré Drouard and Paul Armand Drouard, Rouen, France. (1,190,224; filed April 1, 1912; renewed Feb. 11, 1916.)

Progress Made in the Manufacturing Industries

Poppet Valve Engines.

Bulletin No. 28, recently published by the Nordberg Mfg. Co., covers a line of poppet valve engines which includes three types, namely, full poppet, poppet-uniflow and poppet-corriss. It is pointed out that the engine best suited for the purpose is recommended in each case. For ordinary non-condensing service, the high-speed full poppet valve engine shows the highest efficiency. For condensing service two types of engines are offered—Nordberg poppet-uniflow and Nordberg poppet-corriss, the former being an engine with uniflow cylinder design, that is, exhaust ports in the cylinder barrel and poppet steam valves, and the latter a compound engine with a full poppet high pressure cylinder and a corriss valve low-pressure cylinder. The poppet-uniflow engine is particularly adapted to widely fluctuating loads on account of its flat steam consumption characteristic. Recently two of the largest uniflow engines so far constructed in this country have been shipped to the Youngstown Sheet & Tube Co., for steel mill drive. The poppet-corriss engine is adapted to constant load or constant m.e.p. work, under which conditions it shows very high steam economy. A compound engine of this type, fitted to an ammonia compressor showed by test a steam consumption of less than 10 lbs. per indicated horsepower hour.

The bulletin is well illustrated, showing many installations of engines, and also pictures of details of construction of the valves, valve operating gear, removable cages, cylinders and head. Particular attention is drawn to the construction of the latter, which contains all cored passages and ports, the cylinder proper being a simple cylindrical casting which is free to expand and contract with temperature changes.

Following the discussion of the different types of engines and their construction, a number of pages are devoted to test results. This is followed by a short discussion of the application of poppet valve engines to compressors, pumps and ice machines. The remaining part of the bulletin is devoted to the illustration and description of the frame, bearings, rods, cranks and receiver. Copies of this bulletin are being distributed on request.

Hauling Borax in Death Valley, California.

The 20-mule teams, with their picturesque drivers and long, snake-like 50-ft. cracker whips, that have made Death Valley and the mines of the Pacific Coast Borax Co. in California famous for more than a quarter of a century, and around which romance and tragedy has been weaved by the versatile publicity agent, are giving way to the more prosaic haulage system of modernity.

Within the past year chugging gasoline industrial locomotives, with their trains of from 10 to 15 loaded cars, wind their way up and around black mountains and over Death Valley and the dry bed of Salt lake and the famous mule teams are passing into history. This change has been brought about by the cost data expert, who with his charts and figures and the experiences of others behind him, decreed that while the 20 mules were picturesque and afforded the publicity agent good material for literary essays, they proved too expensive in the production of borax.

The gasoline industrial locomotive, he said, would not only cut down the haulage costs about one-half, but speed up the mines and cut down manufacturing and mining costs. His promise has proven true since the installation of the first two Plymouth gasoline locomotives more than a year ago, according to Supt. R. W. Sheehan of the Pacific Coast Borax Co., and the change was more than warranted by the results achieved.

The full story of this interesting experience, as well as that of other mine owners in different fields, is contained in a 96-page book, "Cutting Haulage Costs in Half," issued by the J. D. Fate Co., 211 Riggs avenue, Plymouth, O., and which was printed for free distribution. Copies of this book may be had by addressing this concern, and should prove

profitable to any mine operator, because of the compilation of cost data and other information.

TRADE PUBLICATIONS.

Products de la Ingersoll-Rand. Ingersoll-Rand Co., New York. Catalog; Form No. 92975; pp. 123; illustrated.

This is an edition in Spanish in which the products of the Ingersoll-Rand Co. are summarized. Different types of pumps, rock drills, air compressors and allied equipment are covered. In as many cases as possible a small illustration is given with a brief description and specific data in tabulated form for most of the equipment.

Roller Bearings. George Automatic Roller Bearing Co., Cincinnati, Ohio. Booklet; illustrated.

Besides illustrating and describing the construction of the bearing, views are given showing the method of taking the bearing apart for cleaning and inspection. Different types of mountings are reviewed and illustrated. It is stated that one of the special features of this bearing is the use of a tapered bearing with balls at either end, thus automatically adjusting variations in the actual diameter of the rollers.

Oil Engines and Pumps. National Transit Pump & Machine Co., Oil City, Pa. Three folders; illustrated.

The first folder is relative to a line of pumps which the company now has in stock. The different types are listed and under each tabulation details are given of the sizes, etc., of pumps of different capacities. Engines for use with the same are also listed therewith. The other two folders illustrate and describe a line of engines using oil or gas for fuel. The operation of all are described in general and briefs are given on the practical use of each separately. Brief statements are also given regarding the cost of operation of the same.

Dry Concentrators. Sutton, Steele & Steele Mfg., Mining & Milling Co., Denver, Colo. Catalog; pp. 16; illustrated.

Concentrating tables, screenless sizers, deduster and dielectric separator are the equipment described. This class of machinery is of most importance, it is stated, where the water supply is costly. In the operation of this class of equipment air under a low pressure is used in place of water, the design of the equipment, of course, being in general like that of the water concentrating tables and classifiers. The machines and superior points of dry concentration are described and compared with water concentration plants. Some specific data is given and a flow sheet of a Sutton, Steele & Steele dry concentrating plant is shown on the last page.

INDUSTRIAL AND TRADE NOTES.

An interesting evidence of Detroit's increased importance as a center of steel consumption comes the announcement that Joseph T. Ryerson & Son have prepared the way for Detroit warehouse development by purchase of a suitable industrial site. The property consists of about 3 acres in the Milwaukee junction district and is one of the few remaining vacant sites having the double facilities of both Grand Trunk and Michigan Central direct trackage.

Taylor Foundry & Engineering Co., Grass Valley, Cal., recently built a 75-hp. Taylor electric hoist for the Sixteen-to-One mine, at Alleghany, Cal. It is equipped with heringbone gears, and will be operated by direct connection to a motor by flexible coupling. This company also sold one of its 22-hp. hoists to the Orleans mine, Grass Valley; and a 300-gal. triplex electric pump to the Enterprise Mines Co., for its Pennsylvania mine; also, a similar pump for Polar Star mine in Grass Valley district.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Tolovona.

According to Dan McCarthy, conditions in the new camp are better than ever and if operators could get plants on their ground the output would be surprising. In a number of places pay has been found, but operators cannot haul machinery over the trail. It will take a greater part of the good season to get it in by river. Operators are taking out pay from 2 below Livengood creek to 20 above. And about the richest ground yet discovered is that of Cub Bear and Henry Crook at the lower end of the camp. Several of the operators on Livengood who have recently struck pay are making arrangements to get plants to their property.

Fairbanks.

At the head of Dome creek a tungsten find has been made and traced over to Cleary creek, near here. George White, mining engineer in charge of the Eagle antimony mine, is reported to have investigated the find and reported it promising. The strike is supposed to have been made by Missou and Rice. Quite a stampede has been in progress to the district.

The Eagle mine produced about 1000 tons in 1915, and up to the present time has produced another 1000 tons. There is a good-sized crew of men at work and these will be added to soon. What the mine will produce during the summer is not known, but it probably will be at least 2000 tons.

J. Leach and D. Thorsón have purchased the interests of Pete Malone in 13 below, Cleary creek. The consideration for the deal is rumored at \$25,000 cash. Several years ago the property belonged to the estate of Mark Sullivan. The property was not considered good and was sold by the administrator to Malone for \$8000, with the understanding that it should be paid out of the ground. Malone has worked the ground and taken out a substantial sum. Last summer he struck very good pay.

Katalla.

A recently formed company, the St. Elias Oil Co., has purchased the property of the Alaska Oil & Refining Co. Falcon Joslyn, one of the principal interests in the company, says: "There are two routes feasible, both about the same distance, which would enable us to ship our coal, oil and lumber into the interior, where the mines and development work demand such materials. The first thing we will do is to try to get patents for more of our claims and at the same time increase the output of the refinery. We are pumping 4 wells at present, but within the month will have 8 wells. We will put in tanks at Katalla to facilitate the immediate shipment. The improvements consist of 9 wells, most of which are down at least 2000 ft.; a complete refinery, which has been in operation for 5 years; several tanks and well equipped camps on different portions of the property, together with tools and drilling equipment. The property was first taken up in 1903 by the English Co., who put down 5 wells very secretly and capped each one after reaching a certain depth. Work was discontinued. Several years passed, during which time there were internal troubles in the company, one part of which seemed trying to depreciate the value of the property, presumably to get control of it—then A. F. Gwin, taking advantage of this, secured the holdings of the Amalgamated Development Co., Vancouver, B. C. The Alaska Oil & Refining Co. succeeded, and through mismanagement went into hands of a receiver in 1913.

ARIZONA.

Oatman.

The Tom Reed Mining Co. has resumed operation of its entire battery of 20 stamps for the first time in several months. But 10 stamps have been in use during 1916 up to this time. Ore has been opened on the new 1400 level of the main workings, and the 600 level of the Black Eagle workings is showing a large tonnage of pay ore.

The Gold Road mine of the U. S. Smelting & Refining Co. continues its usual output, which is estimated at about \$75,000 per month. The mill is also handling 30 tons per day from the Gold Ore mine nearby, and it is reported that the average recovery is \$20. The Gold Ore is continually looking better according to reports of those familiar with the property, and is developing into a splendid property. A 30-ton mill is being planned by the company.

The United Eastern continues to block out ore, and at the same time its new main working shaft is being steadily driven downward. It is estimated that the shaft will be completed to the 600 point by the time the new mill is ready for operation. It is expected to start the mill by the first of November.

The Pioneer mine, handled by Keith & Keith of Boston, is the scene of an extensive development campaign, and the operators claim they now have more than \$1,000,000 worth of pay ore blocked out, with the workings but 400 ft. in depth. A mill is now projected to handle Pioneer ore and ore from the Arizona Tom Reed, adjoining, if ore should be developed. E. R. Hibbard of Chicago is reported to have purchased an interest in the Arizona Tom Reed which calls for the payment of \$25,000 into the treasury.

The Big Jim continues to show improvement as drifting to both east and west is continued on the 400 and 485 levels. Some 200 ft. of drifting on the 400 level is said to show average values of about \$40 for the full width of the drifts; while a smaller amount of drifting on the 485 level shows pay ore but not so high in value. The vein is more than 30 ft. in width on both these levels.

Officials of the Sunnyside state that work of refinancing the company has been successfully completed and that operations will be resumed within a short time.

Lucky Boy officials state that they expect to resume operations within 2 or 3 weeks. They believe that they were but a short distance from ore when work was discontinued to allow their plant to be overhauled. Crosscutting will be started on the 350 level as the first work.

Gilt Edge has resumed operations and is continuing its shaft downward from the 300 point. The heavy flow of water which caused suspension of work is now being taken care of by a new sinking pump. Notwithstanding reports which had been circulated to the effect that the company was in financial difficulties, the officials state that both cash and stock reserves are in good condition.

The Gold Dust Co. is planning to make alterations in the equipment of the old Orion mill, and start operating it on ores which are being developed on its 2d and 5th levels. It is stated that a large tonnage of medium-grade ore is being developed.

The Boundary Cone has at last encountered its expected ore shoot in the west drift on the 750 level. The width and extent of the ore body is not known as yet, but the operators say that it is better than the ore on the 550 level at the same distance away from the main crosscut from the shaft. It is

said that the east drift on the 750 level is also getting into ore. On the 550 level fine milling ore was opened in drifts both to east and west, and then the shaft was carried to 750-ft. depth before lateral work was resumed. Conditions now existing are very satisfactory.

On the 500 level of the Fessenden drifting has been started on a 3-ft. feeder vein which was penetrated by the south crosscut. The vein is quartz, showing high mineralization and fair pan values in gold. The operators expect to drift on it to its junction with the main vein.

The Sun Dial is steadily sinking, with its shaft now down about 150 ft.

Oatman United is steadily sinking, and Engineer J. K. Turner reports satisfactory progress and encouraging formation.

The shaft of the United Northern is now down 370 ft., and will be continued to 500 before lateral work is started.

North Star has started crosscutting on the 400 level and is reported to have cut several quartz stringers showing high values.

Gold Road Bonanza has its shaft down 300 ft. and will sink to the 500 ft. Arrangements are being made with the Gold Road Co., adjoining, whereby the Bonanza will be given permission to drive a crosscut into its ground from one of the deeper workings of the Gold Road mine, for exploration purposes.

Prescott.

During the last few days, several important deals and much unusual development has taken place in the mines of Yavapai county. Probably the most important deal, to Prescott was the transfer of 50 claims on Copper creek, owned by C. J. McNulty and Mike McBride, to the Daly-Crawford-Lewisohn syndicate. The 50 claims are believed by mining men to be in a region which is a continuation of the rich Copper Basin field. Approximately \$300,000 is involved in the deal, to be made in payments as development progresses.

D. R. Finlayson, former superintendent of the Copper Chief mill, has taken charge of the Green Monster property, and is pushing development. While commercial ore has not as yet been struck, officials of the company say the development has been all that could be expected and that they look for important determinations to be made in the near future. A. P. Thompson, geologist, is assembling geological data on the various outcrops and contacts. Road building will be commenced at once. By the time the machinery, which has been ordered, arrives, the foundations and buildings will be ready for installation. The site for the camp on the property is ideal, both from a standpoint of sanitation and comfort. The buildings will all be permanent and completely protected; will be completed and ready for occupancy as soon as the machinery arrives.

The old Sunnyside group of gold mines, 11 miles south-east of Prescott, has been taken over under option by H. A. Groom, of Phoenix, who plans to begin operating soon. This group was discovered in the early 80's by Enoch Williams and a considerable amount of ore taken out and treated by an arastra. Williams also did placer work in the gulches leading to the vein of the group. A tunnel, 383 ft. long, is already on the property, extending about 40 ft. below the surface at a depth where the sulphide zone begins. The Sunnyside vein is traceable on the surface for about a mile, and Groom is confident that it extends to great depth.

Announcement has been made by Supt. William Ellingford, of the Gold Blossom Mining Co., of the striking of a high-grade lead-silver ore body at a depth of 185 ft. Sinking will be continued until the 200 level is reached, when drifting will begin. The property is situated 6 miles south of Prescott and was originally patented for farming purposes.

One of the biggest strikes in the history of the Walker district was made this week on the old Homestead mine, recently acquired by J. J. Shockley and associates, of New York. A 3 ft. gold ore body was encountered, carrying a good milling grade in the loose formation. The strike was made at a depth of 75 ft. in the main shaft. The Homestead lies in the center of the Walker and was first operated in the 60's by J. J. Milliken, when its free product was treated by an arastra. The old mine was abandoned when base ores

came in and until its recent re-opening, the property had lain idle for almost a third of a century. The strike in the Homestead has encouraged many other operators in the Walker and adjacent districts.

Extensive exploration and development is being planned on the New State property in the Hassayampa district, following a strike made several weeks ago. The Elk holdings are to be worked at once. A force of men is now employed in cleaning out and retimbering the old 525-ft. tunnel.

Jerome.

The Jerome-Victor Extension shaft at Jerome is to be sunk about 500 ft. below the present level, 1200 ft., work to start within a few weeks. The 700 station has been reached in unwatering the property, formerly known as the Haynes property, and as there is no lateral work below this level, the unwatering will from now on proceed rapidly. After sinking is started, it is expected that the shaft will be put down at the rate of 100 ft. per month. Only 120 ft. of cross-cutting and drifting was done on the 1200 level and it is believed that prospecting of the lower levels on the mine will disclose new leads that will change the plan of operation.

The main shaft of the Pittsburg-Jerome mine has been sunk 195 ft. below the 500 level, and considerable copper is showing on the face of the ledge, with a soft formation in the bottom of the shaft. Indications of water encountered on drifting in the south crosscut have led to the construction of a dam across a drift run from the 500 level at a point 160 ft. north of the shaft. The road to the property is being built by a force of 75 men. An extra crew has been put at work at the mine. The new road, although longer than the old one, will have a much less grade and will make the hauling of ore and supplies an easy task.

CALIFORNIA.

Grass Valley.

Close to 400 tons of ore per day is hoisted from the central shaft of the North Star mines. The ore, after being dumped, passes over grizzlies, the undersize, amounting to over 200 tons, passes direct into the mill bins; the oversize, amounting to 170 tons per day, passes through mechanical feeders to two sorting tables, where 6 men and a foreman, working one 8-hour shift, pick out 70 tons of waste, consisting of diabase and granodiorite. The picking tables are given a longitudinal shaking motion, by which the ore is moved forward and fed to a jaw crusher by which it is reduced to a size required for the stamp mill. By this arrangement the sorters handle an average of 11½ tons of waste per man in 8 hours.

Weimar.

New York capitalists have taken under bond and option the Big John gold mine, 8 miles east of Weimar, and also bonded the holdings of J. D. Nelson and Joe Snyder. It is stated work will commence within 30 days. The Big John has produced some rich ore and is stated to contain much profitable quartz.

Alleghany.

The Morning Glory Gold Mines Co., whose affairs are managed by A. A. Codd, is building a 5-stamp mill. Amalgamating plates and a table will serve to recover the gold.

A 75-h. p. electric hoist has been purchased by the Sixteen-to-One Mining Co. and it is probable a stamp-mill will be acquired within the next few months. An excellent tonnage of milling ore has been exposed in the lower workings, with occasional seams of specimen quartz found.

The Croesus Mining Co., of Chicago, is adding 5 stamps to its 15-stamp mill at the Plumbago mine, increasing its capacity to 70 tons daily. The main ore body has been opened at widely divergent points and shows quartz of uniformly good grade. W. E. Pearson is manager.

Recent work in the Twenty-One, adjoining the Tightner, has been of such a satisfactory character that the management is arranging to install a 50-ton Hendy mill, which will operate in conjunction with the Lane mill now in commission. The Morning Glory is to be equipped with a compress-

sor, hoist and 5-stamp mill. Much good ore has been recently opened in virgin territory.

Arrangements have been made for installation of a compressor at the Louise Con., and an Allis-Chalmers ball mill is being placed in position at the Irelan. Other companies are planning improvements to their plants. Completion of the new mills will increase the output of this district to from 350 to 400 tons per day.

Jackson.

The Argonaut Co. has completed its impounding dam for restraint of mill tailings and will divert them into the basin in the early fall. The dam is approximately 500 ft. long and 40 ft. high. Construction of the new 40-stamp mill is making good progress. The rock crusher is in place and considerable machinery for the main plant has been installed. Ore of splendid grade is coming from below the 3800 level for reduction in the old 40-stamp plant.

The Kennedy Mining Co. has arranged to increase the height of its restraining dam from the present 40 ft. to 60 ft. Shaft sinking is proceeding rapidly and ore of excellent grade is being drawn from the 3700-ft. workings. As soon as the 3900-ft. point has been gained extensive lateral workings will be driven from this level. The company is paying good quarterly dividends.

Nevada City.

The Delhi mine, in the Columbia Hill section, has been taken under bond by Colorado capitalists. Unwatering has commenced and it is expected to start mine examination within a few weeks. The Delhi has been idle about 10 years, but formerly produced well. W. D. Griffiths is in charge of operations.

The Columbia Con. Mining Co., with headquarters at Nevada City, has arranged for the building of a 20-stamp mill at its Ocean Star mine in the Ormonde district. A 200-h.p. electric generator has been installed and will deliver power to the Ocean Star and Columbia properties. A ball mill and mine machinery are also to be installed at the Ocean Star. At the Columbia 10 stamps are falling on good ore. The company has augmented its holdings by the purchase of upward of 100 acres of patented ground. E. C. Klinker is manager.

Amador City.

The new mill at the Treasure mine is making a high-gold extraction, according to late advices from the property. Hardinge ball mills are employed in place of stamps, with the resultant product treated on Witley concentrators, Deister-Overstrom tables and Frue vanners. The ore shoot in the new shaft has widened into a strong vein.

Independence.

The Reward group of gold mines, including the noted old Eclipse, has been acquired by English capitalists for a reputed cash price of \$50,000. The property is a large, low-grade, gold proposition and was operated over 60 years ago. The Eclipse is credited with an output in excess of \$3,000,000 and was equipped in 1853 with a stamp mill, shipped from England. It is stated the new owners will install a large flotation plant. The main ore body assays around \$8. The syndicate is represented locally by A. Burnett and J. A. Summers.

The Keane Wonder mine in Death Valley is to be extensively operated, according to present plans. The company will be reorganized and endeavors made to open a large tonnage of ore below the present workings. The cyanide plant is operating at present on tailings. The Keane Wonder is owned by the Frances Mohawk Co. of Goldfield. F. N. Fletcher, of Reno, Nev., is manager.

Slatington.

The Sierra Slate Corporation of New York has acquired the Enreka slate quarry and has started work. It is stated 50 men will be employed within a few weeks and from 1000 to 3000 squares of slate will be sent to eastern points. The slate is of splendid quality, particularly for roofing purposes.

Nashville.

Developments on the 500 and 600 levels of the Montezuma mine are disclosing wide bodies of milling ore, in places over 40 ft. wide. Assays range from \$5 to \$30. Sinking of the shaft to the 1000-ft. point has been completed and

drifts and crosscuts have been started to pick up and develop the main ledge. The Montezuma is being worked under bond and option by the Wingfield interests of Nevada and eastern people headed by W. J. Loring. The same people hold a bond on the Havilla, an adjoining property, and will probably work it through the Montezuma shaft.

Portola.

The 100-ton flotation unit at the Walker copper mine is operating on excellent ore and shipment of concentrates will start within 20 days; 150 men are on the payroll and a large amount of new underground work is proceeding. Motor trucks are operated between the mine and Portola delivering supplies, etc.

COLORADO.

Cripple Creek.

The Rex Mining & Milling Co. has put the Ironclad mill again in commission, Thomas Kavanaugh, manager of the plant, having set the machinery in motion on July 18. The plant has a capacity of 100 tons daily. This tonnage will be mined from the open cut on the Magna Charta property adjacent to the mill. Kavanaugh has miners prospecting by adit tunnel driven into the Newton Hill spur of Ironclad, on the Annex lode. The dirt from this tunnel pans freely.

Margie M. Gold Mining Co., an eastern corporation, will reopen the Little Daisy mine. F. F. Eddy of Boston is in the district purchasing mining supplies and arranging for the starting. The property is located near the Midland Terminal tracks, a short distance from the shaft house of the School Section Leasing Co., on Block 8 of School Section 16, on the west side of the railroad.

Below the 650 level of the Jerry Johnson main shaft Cripple Creek Deep Leasing Co. has loaded out 2 cars of ore, mined from the vein under development at the 850 level, making 5 cars shipped since operations were resumed on June 25. The ore is averaging \$20 a ton. The Deep Leasing Co. is driving a crosscut to the contact east of the shaft, from the 750 level. It has been carried 100 ft. and is nearing the contact when it is expected ore will be encountered, as the ore at the deeper level is found in the granite-schist contact.

The Isabella Mines Co. made about \$12,000 net profit during June from a production valued at \$37,000. This included lessees and company account operations. This profit is good, considering that the company shipments totaled but 15 cars mined from the rich shoot on the Buena Vista vein, under development at the bottom level of the Lee shaft, at a depth of 1275 ft. This ore is high-grade, 2 cars shipped during the month having netted \$4749. Lessees who were accredited with the shipment of between 50 and 60 cars shipped considerable low-grade ore, lowering the general average value of the June production, which, however, will not fall below \$20 a ton.

Leadville.

S. Marshall Carlton states that he believes the Penderly fault, which was first encountered in the Judge Penderly property on Carbonate hill in the early days and later traced north into the Augusta and Clipper claims where it was found through the workings of the Northern shaft, has again been cut in the Alright property on Poverty Flats. The lessees on the Alright recently encountered granite in their drifts at 260 ft. and 40 ft. east of the shaft. Here the face of the granite is exposed for several feet, both above and below the level of the drift and undoubtedly is the east side or upper bench of the Penderly fault. Should this prove to be the case, one of the important faults in the Leadville district has been traced between 2500 and 3000 ft. further north than it has been known to exist. Such properties as the Alright, Jason, Northern and Coronado, which are on the west side of the fault, will have to be greatly increased in depth before reaching the ore zone, which was encountered at a depth of 260 to 300 ft. in the Hibsche and M. E. C. properties on the east side of the fault. The theory is that before the faulting, the Fryer hill basin continued west as far

as the D. & R. G. depot and encompassed the greater part of the territory throughout Poverty Flats and North and South Fryer hills, including that portion of Evans gulch. The upheaval is assumed to have broken the basin nearly in half, bringing the granite close to the surface at the east side of the fault, from which point it pitches rapidly to the east under Fryer hill. The west side, broken by the upheaval, shows the formations slightly upturned at the line of faulting, leaving them in place further west. Mining close to the fault on the east side will be shallow, but the dip of the formations to the east again leaves most of the upper zones in place under Fryer hill.

Rico.

The Rico Wellington property is now out of debt for the first time in several years. It has \$96 in cash on hand and between \$15,000 and \$20,000 worth of ore in transit and unsettled for. The property is shipping 35 cars a month, which are netting about \$600 each. The lower workings are beginning to open up ore on the other side of the fault that was believed to have been the end of the ore. The ore body was cut off by the fault, but it is again being picked up and will be as good as the ore that has been taken from the old workings. The ore that is being opened shows a low grade ore in the upper part of the face, while the lower part of the face looks like shipping ore. At the time the control of the property was taken over by the Jesse Knight interests of Utah there was a bond of \$150,000 on it. There was also expended \$75,000 for a mill and other equipment. Since then \$250,000 has been spent in development, which was quite expensive, as it was hand work. Debt now has been cleared from the company's accounts by the present management.

IDAHO.

Burke.

The Marsh Mining Co. has secured from the Federal Mining & Smelting Co. a favorable lease on claims adjoining its property, forming a portion of the Tiger-Poorman mine. The lease runs for 10 years at a royalty of 35 cts. a ton, while lead sells at 5½ cts. or less, with an additional royalty of 30 cts. for each cent above that figure. This lease ends all threatened litigation between the Marsh and Federal companies and settles all claims for damages by the latter company for alleged trespass by the Marsh. The Marsh is to be reorganized soon as the Marsh Mines Con., capitalized for 2,000,000 shares at \$1 each, of which 500,000 shares are to be held in the treasury, subject to subscription by stockholders of the Marsh Co. of record Aug. 10, at 15 cts. a share, payable in three 5-ct. installments; that remaining unsubscribed to be taken over by a stockholders' syndicate that has underwritten the entire block. Exchange will be made share for share of new issue for the old, and the Spokane & Eastern Trust Co., Spokane, the company's transfer agent, will exchange the certificates free of charge, and at the same time receive subscriptions for the treasury shares of the reorganized corporation.

Kingston.

Additional equipment is being installed in the mill of the Hypotheek Mining Co. and when the enlarged plant is ready to operate the capacity will be increased from 100 to 200 tons daily, according to Otto A. Olson, secretary and assistant manager. "While these improvements are being made we are operating the mill about half time," said Olson. "Since the plant was put in service a few weeks ago we have shipped to the Northport smelter 3 cars of concentrates and 3 cars of mixed concentrates and crude ore, but hereafter the shipments of concentrates and crude ore will be kept separate. The crude ore averaged 75% lead and a car of concentrates went 55% lead, while the remainder ran 65%. Recent development in the mine has resulted in opening some good ore bodies. On the intermediate level between the 700 and 900 levels the ore shoot has now been drifted on for 120 ft. and still shows 6 ft. of fine milling ore in the face. On the 1100 level the first ore shoot proved to be 70 ft. long, and the drift now looks as if it were breaking into a second. The

ledge in which these ore bodies occur is parallel to the vein, which was so extensively developed during a long period of years by the old management, and between 500 and 600 ft. south of it."

LAKE SUPERIOR.

COPPER.

Houghton.

New Arcadian has found that the shaft, which is being carried down to the new lode on the 6th level, about 315 ft. from the exploratory shaft 1800 ft. south of the working shaft, is mostly in the foot-wall side of the lode, but that the part of the lode that is laid bare is well mineralized. It will not take long to extend the pit and then to cut through the remaining 23 ft.; and then the drifting which is proceeding rather slowly in the same kind of coarse stamp rock first found by the crosscut will be driven along rapidly in both drifts. The ground is looking particularly good in the 900 level north, almost over to the New Baltic boundary. The shaft is down about 70 ft. from the 1250 level on its way to the 1400, with the usual speed.

Calumet & Hecla is shipping to the mills a daily average of about 10,400 tons of rock, a rate that was not lessened a particle by two holidays.

Hancock is increasing its yield up to about 21 to 22 lbs. of refined copper from richer ground at its own No. 2 shaft and by closer selection, and it is expected that if the present prices continue, that the profit for the year will be \$300,000 to \$400,000. This will be enough to pay indebtedness and leave a good surplus. Hancock knows now after a long exploration of the five lodes the average that can be depended on from them, and that it will give a good profit. The local feeling concerning the Hancock has wavered, it is true, it would naturally over so long a period of development, but now the belief in the future of this mine is becoming very strong. The management will raise the increase over the normal pay of all its employes that is now prevailing from 10 to 15% and will also pay 25 cts. a day from July to all employes on the payroll of Dec. 31, as has been announced by the Calumet & Hecla, Mohawk, Wolverine and Quincy.

New Baltic this week set men to work breaking ground on property owned by the Johnson heirs, for the purpose of starting a shaft, as the management believe that by their deeds they have a legal right, but the owners had the men arrested. It is likely that this is only the first step towards ascertaining what authorization the company possesses. The company has endeavored to purchase the land they desire, but it and the Johnson heirs have been unable to agree, and this has led the company to believe that it has a legal right to take steps to bring the matter to a head.

Indiana will very soon commence to explore the Knowlton and Butler lodes and probably a shaft will be sunk after the proper data has been gathered concerning the outcrops. There is every reason to believe that these lodes persist through this mine and that they carry their usual mineralization. They will have a strike of over three-quarters of a mile and a very great depth. The search for the felsite bed that caused the stock to sky-rocket about 6 years ago still continues and though it has been fruitless so far, the chances are considered good from the geological data.

North Lake is expected at almost any time to cut into a lode that made a very good showing in the diamond drill cores obtained about 3 or 4 years ago, and there are two or three other lodes beyond to the southeast that also disclosed encouraging rock. These lodes have not been identified so far and their opening will give valuable geological data even if they should not reveal any copper. A distance of 650 ft. will have to be covered before the lodes to the northwest, Nos. 1, 2, and 3 of the North lodes of the South Lake, can be reached by the crosscut that is now being driven in that direction.

Cherokee last week began mining operations and blasted out in two cuts a showing of copper that fulfills the promise of that entered at the top of the lode. There is much heavy

copper both mass and stamp, but the former predominates. The new Lidgerwood hoisting engine is now running and the exploration will be pushed; the small exploratory shaft will be sunk far enough to ascertain if the mineral contents warrant the opening of the property as a mine. There is an ample amount of money in the treasury.

IRON.

Iron Mountain.

New work is being commenced by the Oliver Co. in this vicinity. There has been a fire in the Dober mine for several years and as it continually keeps growing worse it has been decided to flood the mine and quench the fire. The fire is supposed to be between the 4th and 6th levels. For the purpose of flooding a flume has been built from the mine to the river. Later the mine will be pumped out and efforts will be made to keep the fire from starting again.

The closing temporarily of the Dober will not put any men out of work, as work will commence at once on the new shaft on Section 2, directly west of the old shaft. The new shaft will be concrete and one of the best on the range. Very few miners have been employed at the Dober since it filled with gas several months ago, only trammers remaining at work getting out the ore that was broken down. The new shaft will be pushed to completion at the earliest possible date. It will be a 4-compartment shaft and when finished will serve three mines, the Dober, Isabella and Section 2. After the Dober filled with gas experts were employed to ventilate the mine. A blower was installed and the gas driven out to an open pit. Since that time sulphur fumes have been pouring out of the open pit to the discomfiture of residents on the windward side of the pit and the destruction of gardens, trees, lawns and vegetation. It was to abate this nuisance as well as bettering conditions for the men underground that the management decided to flood the mine and crown out the fire.

Ishpeming.

Work started by the Cleveland-Cliffs Co. at the Holmes mine is going ahead rapidly. The shaft being sunk through diorite is going down at the rate of 125 ft. a month. A hoisting system has been devised by Supt. L. C. Eaton. Two buckets are used for hoisting the rock and other material and are operated in such a manner that they cannot dump while being hoisted, nor can any rock fall back into the shaft, even after they reach surface. As the buckets come out of the shaft the openings close behind them. The buckets are operated as effectively as skips or cages are usually handled. Oliver is driving a drift from Section 16 to the Holmes mine, to be used as an opening for the workmen in case of fire or other trouble underground. As soon as the Holmes shaft reaches a point directly opposite the Oliver drift Cleveland-Cliffs will start a drift to meet it. The brick combination office and warehouse, which is the first of the permanent buildings to be erected, is about complete. The foundation for the engine house has been completed and work has been started on the concrete base for the ore crusher. The concrete portion of the crusher plant will be 80 ft. high. There will be 3 crushers in all and the plant will be one of the largest on the range. The air compressor and hoisting engine are on hand, ready to be put in place, though it will be some time before any of the buildings for the machinery will be ready.

House & Person have the contract to strip for the stockpile ground, the tracks leading to the shaft and crusher. They will complete their work in a few days.

MISSOURI-KANSAS.

Joplin, Mo.

Among the mine operators of the Joplin district the consensus of opinion is that the zinc market has reached the bottom, and that a reaction may be expected within a short time, owing both to the decreased production on various accounts. Production is off probably in excess of 2000 tons. Among the mines reported down are, the four plants of the A. W. C., Ramage, Once More, Airedale, Rebecca, Sparkler,

Liberty Bell, Cygni at Prosperity, three of the Carmean & Squires plants at Webb City, and a number of smaller mills.

A rich blende ore strike near Belville has been made which promises the development of a big mine in the near future. The land is owned by J. H. Stephens, and the company is composed of Roy Clayton, Harry Stephens and W. T. Penniman. The new Bonnie Bell Mining Co. has sunk a shaft northwest of the original one on the Mexico-Joplin land at Thoms Station, and has an excellent run of ore at 100 level. Further development is to be pushed.

The completion of the new \$100,000 concentrating plant on the Chapman land by Chapman & Longacre gives to the Joplin district one of the larger mills, its capacity being 1000 tons per 20 hours, and is thoroughly modern throughout. The new Cumberland plant replacing the one burned down in May has been completed. This plant is owned by F. C. Wallower and is much larger than the old one.

Jess Breigel and associates have started up their new Mary C mine at Prosperity and expect to have it going full capacity in a few days. The new mill owned by George J. Kusterer, Thomas H. Noonan, Courtney G. Talcott and eastern capitalists is about ready for operation at Duenweg. A new sludge plant is being erected by the A. W. C. Mining Co. on its tract on West Seventh street, located some distance to the east of the No. 2 mill.

Miami, Okla.

An unsuspected body of ore was opened up recently by the Admiralty Zinc Co. on its leases. The new mill is located west of the first mill which was erected by the Century Zinc Co. before the sale to the Admiralty Zinc Co. was consummated. The combined output of the two plants will not be less than 3 carloads per week. The power plant of the King Jack mine was lost by a cave-in recently, entailing a loss of from \$1000 to \$5000. The King Jack is owned by the Commerce Mining & Royalty Co. and it has not yet been decided by that company whether to abandon the mill or to build the ground up near it and install a new power plant on the other side from the cave.

MONTANA.

Butte.

The Anaconda Copper Mining Co. has awarded a contract for the sinking of the Nettie shaft from the 500 to the 1500 level and work on it has already started. This means that the necessary work to show what can be expected in the lower levels of all the western Butte mining district is to be done. The Nettie is proving to be an exceptionally rich mine in silver values and some picked samples of ore are said to run as high as 600 ozs., while the average now being taken from the 500 level is very high in silver. The Davis-Daly, Butte & London and several other companies have mining claims in the western district and the development of the Nettie to the 1500 level will give the owners of those properties some idea of the values at that depth in their own properties. The work of completing the shaft from the 500 to the 1500-foot level will take about a year. The shaft is to be 3-compartment. The only other deep mining planned at present west of the central Butte district is that at the Butte & Zenith City, which is some miles beyond the Nettie. The showing in both of these shafts as they go down will be watched, as it is possible a new mining district covering a big extent of ground in the entire section will be opened up.

The North Butte Mining Co. had the best month in the past year in production of metals in June. With both the Granite Mountain and Speculator shafts in use for hoisting the total tonnage for the month was 41,136, or about 1500 tons per day. From this was realized 2,096,326 lbs. copper, 90,713 ozs. silver and 142.23 ozs. gold. This was the largest metal reduction and by far the largest production in point of value that the North Butte Co. has had in some years. Supt. Braley hopes to reach soon the production point of 2,250,000 lbs. of copper per month that he has been striving for.

The report of the Barnes-King Co. for June, just issued by President Goodale, shows that very little gold was taken

out at any of the properties during the month, as shutdowns had been necessary to prepare for the increase in output at all of them. At the North Moccasin the plant was closed down from June 15 to July 1 for needed repairs. It had been expected that the work could be done in a week or 10 days, but it took over 2 weeks. The mining and milling operations were resumed July 1 so that the present month will doubtless show a normal production. The mill ran during the first 14 days of June and treated 945 tons, and from this the cleanup amounted to \$7800, or a little over \$8.25 per ton. This was a big improvement on the ore showing in April and May. At the Piegan-Gloster the mill was in operation 8 days and was then shut down without a cleanup of resulting bullion from the treatment of 700 tons of ore. The installation of new machinery, required for the treatment of Shannon ore, made this shutdown necessary. The pumping equipment for the Gloster shaft, which was promised for March 15, has not yet arrived. The mine is now drained, however, to the 500 level and it is expected that there will not be much further delay in unwatering the winze below the 500. When this is done it will be possible to begin mining the good ore which it is believed exists below the 500. At the Shannon there has been some vexatious delays also. The delivery of material has been slow and bad weather in the last few months was responsible for delaying the construction of the aerial tramway. The work at the present time is going forward and the management expects soon to have the aerial tramway completed. Shipment of the Shannon ores which are already on the dump will then begin and the ore treated at the Gloster mill. The Shannon vein on the tunnel level is being explored to the west, but has not yet discovered a new ore shoot. At the Woodrow Wilson work was continued during June on tunnels Nos. 2 and 3, and a distance of 105 ft. was driven. No 1 tunnel was timbered where it was beginning to cave.

NEVADA.

Goldfield.

Seams of \$15 ore are being opened in the big vein on the 225 level of the Lone Star, now being drifted on in a southerly direction from the Nelligan shaft. Driving is proceeding in hopes of intersecting the vein which yielded rich ore when worked several years ago by the Patrick lease.

The Goldfield Oro has resumed work on the 800 level at a point where seams of good ore were recently encountered. The work is advancing in the great Columbia Mountain faulted zone, where some of the richest ore in the district has been mined in nearby properties. The company is also preparing to start work at other points on the 700 and 800 levels.

Fully 20 companies are operating in Goldfield, in addition to several individual owners and lessees. The success of the flotation process at the Goldfield Con. has instilled new life into the field and many properties long idle are undergoing development. The Goldfield Con. Co. is now sending about 800 tons daily through the flotation units and will have the plant operating at its full capacity of 1000 tons in a short time. June net earnings are estimated at \$40,000. It is stated July earnings will probably be the best of several months.

Rochester.

Native silver discovered in the bottom of the Codd winze below the 800 point on the dip of the East vein, together with the shipment of \$16,700 in gold and silver bullion representing the first half of the month's mill run, are the two most important happenings in connection with the Rochester Mines Co. during the past week. In north territory, Raise 166 from the 250 level on the East vein, is being carried up 30 ft. wide, breaking from 5 to 7 ft. of ore averaging \$25. The entire bottom of the Codd winze is in ore of better than average milling grade. Occasional pieces of native silver are found which are the richest specimens ever found in the camp. The Codd winze will be connected with the raise from the Friedman tunnel at an early date, furnishing a new outlet for ore from all portions of the mine, to move by gravity

from the stopes to the mill. Connections have been made in the north portion of the mine with the old Tero raise of the Four J workings in Block 3, and the drift is continuing, soon to enter Block 4 of the Crown Point claim. As has been previously reported, it is now believed that the ore shoots already encountered in both the East and West veins in Block 3 are the downward extension of the rich apexes formerly mined by the lessees, and which produced in Block 4 some of the best ore ever found on the hill. Preparations are going forward rapidly in the mill for additional equipment which is counted upon to nearly double present capacity.

Seven Troughs.

The bottom of the Bird Winze in the Seven Troughs Coalition which has reached the 1740 point has just cut a 6-in. stringer of ore running nearly \$500. A larger streak of almost the same richness has been passed through, and no hanging wall yet in sight. The winze is cutting diagonally through the vein at this point, exposing a large body of mineralized matter with the high-grade streaks running through. The ground is heavy and the progress slow, but more important announcements are looked for at any time. In the north drift on the 1700, three streaks of high grade are now exposed, giving greater indication of being the same ore shoot exposed in the deep winze.

National.

N. P. R. Hatch, Chicago, who has a lease on the Buckskin National Gold mine, is building a 10-stamp mill on the property. The gold will be saved on plates and tables. This mine belongs to Senator Bell and associates of Winnemucca.

The Indian Valley No. 2 mine, in charge of F. R. O'Leary, has cut the National vein by driving an 800-ft. crosscut, the vein having been cut at a depth of 300 ft.

Mancy brothers, railroad contractors, have secured a lease on the Auto Hill group and have commenced sinking a shaft.

Gerlock.

Toboqua Mining Co., controlled by John Harman and associates, is operating a mine and mill and shipping silver-lead concentrates, running 165 to 170 ozs. silver and 40% lead. The property is 40 miles from Gerlock, on the Western Pacific railroad. The June shipments amounted to 3 car loads, which were sent to Salt Lake smelters. The mine is developed through tunnels and one 550-ft. shaft. A 2135-ft. tunnel level, through which all ore is now taken out, taps the main workings at the bottom of the shaft. Greater depth on the ore is gained by a 200-ft. winze from the tunnel level. The workings in ore extend about 900 ft. along the strike of the vein, which has a width of 2 to 3 ft. The ore is a sulphide, in a gangue of andesite and lime. All the ore is concentrated in a 60-ton mill, equipped with a crusher, three sets of rolls and seven tables and vanners. Water for mill work is pumped from the lower workings up to the tunnel level, through which it drains out. The pump is driven by compressed air.

Yerington.

Pittsburg Dolores Mining Co., for which E. J. Schrader is general manager, is mining and milling about 70 tons per day of gold and silver ore, running \$9, making an extraction of 92% by cyanidation. The property is located 25 miles south of Yerington. The ore body has an average width of 2½ ft., and is contained in a vein that occurs between a grano-diorite foot wall and a rhyolite hanging wall, the basic formation being grano-diorite. The gold and silver are associated with iron sulphide, accompanied by some arseno-pyrite and antimony. A small percentage of the silver is argentite. The mine is opened by adit levels on the vein and by crosscuts to the vein, and a winze is being sunk from the lowest tunnel level. The underground workings aggregate 14,000 lineal feet. The ore is transported from the main tunnel level over a 1500-ft. surface tramway to the mill. The mill equipment for pulverizing consists of one crusher, 2 sets 14 by 27 Colorado Iron Works rolls, one 5 by 18-ft. Allis-Chalmers tube mill. The rolls reduce to 4 mesh, and 70% of the tube mill product will pass 200 mesh. Cyanide solution is introduced in the trommel ahead of the coarse rolls. In the leaching process that follows fine grinding, the Dorr system of counter-current decantation is used. The metals are precipitated in zinc boxes. They use 1½ lbs. of cyanide per ton of ore, and 14 lbs. of

lime. In milling ore running \$9, there is \$7 gold and \$2 silver. The mill tailings run 60 to 70 cts. The matter of installing a ball mill to replace the rolls is being considered. Mining costs are given at \$1.50 ton; milling costs, \$2; transportation, 20 cts., and general expenses, 70 cts. C. R. Olson is mill superintendent, J. B. Perry being mine superintendent.

NEW MEXICO.

Mogollon.

A. H. G. Palmer, manager of the Alberta Mining & Development Co., is in camp arranging to start work on the Alberta group of claims. This company owns some of the best located mineral land in the district, with a considerable tonnage of mill-grade ore blocked out ready for mining. The property is opened by a 300-ft. tunnel which cuts the main ledge, on which drifts both east and west have encountered bodies of good ore.

The main shaft on the Eberle mine, operated by the Oaks Co., has been unwatered and timbers repaired. Both north and south drifts from bottom are being advanced, yielding a grade of ore practically all of which is being shipped to custom mill. This work is on the Queen vein or Mother lode of the district, which in places has a width of 50 ft.

Retimbering of shaft to 500 level on the Pacific mine has been completed and electric power is delivered from the central plant of Socorro Mining & Milling Co. The property will be operated electrically throughout. Extensive developments will now be actively conducted and regular ore shipments started to the Socorro Co.'s mill as soon as the aerial wire rope tramway is completed.

The last semi-monthly bullion shipment by Mogollon Mines Co. amounted to 1500 lbs. of gold and silver.

Abundant rains in the mountains the past week have assured a continuous ample water supply for mine and mill and all plants are running at full capacity. The economic importance of utilizing one of the locally available sites for a hydro-electric installation is becoming more and more apparent, and it is confidently believed some definite steps to this end will be taken in the early future on a scale sufficiently large to meet the growing power consumption of the district.

Santa Fe.

Charles W. Henderson in his report to the U. S. Geological Survey for the first half of 1916 shows small increases in the production of gold and silver and large increases for lead, copper and zinc. In the Mogollon district, which in 1915 produced 40% of the gold and 65% of the silver output of the state, the Fanny and the Last Chance cyanidation mills were operated continuously, and the Cleaveland-Weatherhead mill, idle in 1915, was placed in operation in April. Gold bullion and concentrates continued to be shipped from the Elizabethtown district, Colfax county, and gold bullion from the Whiteoaks district, Lincoln county. The output of silver was affected considerably by the idleness of the Cosak cyanidation mill, in the Cochiti (Bland) district, Sandoval county. Gold-copper ore continued to be shipped from the Orogrande district, Otero county. The purchase by the Phelps-Dodge & Co. of a large area in the Organ Mountain district, Dona Ana county, promises a future production of all five metals. Silicious and copper ores carrying gold were shipped from the Lordsburg district in quantities that indicate an output nearly double that of 1915. The Santa Fe Gold & Copper Co.'s matting plant at San Pedro was operated continuously. The Burro Mountain Copper Co.'s flotation mill in the Burro Mountain district, was placed in operation in April, 1916. The Chino Copper Co.'s mill, which in 1915 produced concentrates containing 68,293,893 lbs. of copper, yielded during the first quarter of 1916 a total of 16,267,450 lbs., the total quantity of ore treated for the three months being 714,400 tons, an average of 7850 tons a day, the highest average tonnage treated by the mill since it began operations. Shipments of copper from the Magdalena district increased. Lead ore was shipped from Cooks Peak and Tres Hermanas districts, Luna county; from the Central and San Simon districts, Grant county; and from the Mag-

dalena district, Socorro county. Increased shipments of zinc carbonate and zinc sulphide concentrates were made from Magdalena, Hanover, Cooks Peak, Florida, Tres Hermanas, and Pinos Altos districts. A mill was erected in the revived Steeplerock district, Grant county, and some shipments were made.

OREGON.

Baker.

Charles G. Yale, reporting to the U. S. Geological Survey on Oregon for the first half of 1916, says: "The bullion receipts of the mint and smelters at San Francisco show that the output of gold has increased \$107,000 and that of silver 11,000 ozs. in the first part of 1916 over the output of the corresponding period of 1915. The increase in gold is due entirely to dredging operations. The Powder River Gold Dredging Co., which in the first half of 1915 had but one dredge operating, near Sumpter, has been working with two dredges during the first half of 1916. With the exception of three deep mines, all in Baker county, this is the largest gold mining enterprise in Oregon. The properties of the Cougar Mining Co., near Sumpter, have been placed under lease and bond to the United Gold Mining Co. of Spokane, Wash. in addition to the 200-ton mill, tube mills and a cyanide plant are to be installed. The Queen of Bronze copper mine, which ships its ore from Waldo by team to Grant's Pass and thence by rail to smelters at Gennett and Tacoma has been sold to men who intend to extend a railroad to Waldo. After years of idleness work has been resumed on the Iron Dyke mine at Copperfield, which is shipping ore to Colorado for reduction. The Black Eagle property, near Grant's Pass, has been sold to men who are to erect a 50-ton mill. There is a notable activity in the hydraulic mining industry of the state, particularly in the counties along the northwest border of California. Many old properties have been reopened, and new ones have been put in shape for working. The most productive deep mines in the state continue to be those of the Cornucopia Mines Co. and Baker Mines Co., in the Cornucopia district, Baker county; Commercial Mines Co., in the Mormon Basin district; Homestead, Iron Dyke district, and Humboldt Con. Gold Mines, in Malheur county. The largest producers among the placer mines are the Powder River Gold Dredging Co., Baker county; Columbia mines placer, in the placer district, Josephine county; Sterling hydraulic, in the Forest Creek district, Josephine county, and Layton, in the Applegate district, Jackson county. Baker continues to be the most productive county in the state, containing nearly all the larger mines."

SOUTH DAKOTA.

Lead.

The Custer Peake Copper Co. is installing a new 100-h.p. boiler and compressor, and about Aug. 1 the shaft will be unwatered and development work started. The shaft is now down 250 ft. and will be continued to 500 ft., followed by lateral work. It is the intention to thoroughly develop the deposits. It is also probable that a concentrator plant will be erected later.

The Deadwood Standard at Ragged Top has been turned over to leasers and the 100-ton cyanide plant is being put in shape for operation. Local parties are in charge and it is expected that the property will again become a regular producer.

Announcement is made that the New Puritan Co. will commence work soon. For some time past the plants on the property have undergone repairs so everything will soon be in readiness for active operations. The property is equipped with a modern cyanide plant.

Development funds to the extent of about \$100,000 are in the hands of the Custer Peak Mining Co. and preliminary work has been commenced to sink the shaft to the 500-ft.

level. A new 100-hp. boiler is being installed, at the side of one of equal capacity, which served to furnish power when past operations were in progress. A 5-drill Norwalk air compressor has been delivered at the hoist and is ready to be set on its concrete base, which is being constructed. The repairing of the upper 75 ft. of the 2-compartment shaft is completed and it is expected that the removal of the water from the 250-ft. shaft will commence soon. A skip and a No. 5 Cameron pump will be used for the purpose. John H. O'Brien, general manager, estimates that \$25,000 will be sufficient to put the shaft down from its present level, 250 ft., to 500 ft., leaving a surplus of \$75,000 for the construction of plants as may be necessary for the treatment of ore. The property has developed from a gold and silver prospect at the surface to a promising copper mine at 250 ft. The first discovery which was sampled showed a 6-ft. vein which assayed \$7 in gold and silver. It was regarded as sufficient for the investment of \$60,000 which was expended to bring about the present development. The vein widened as it was sunk on and at 100 ft. had changed into a solid body of iron sulphide. At 150 ft. indications of copper appeared and these gradually increased until, at 250 ft., there is a formation vein about 100 ft. wide which will sample between 1½ to 2% copper and carries \$2 in gold and silver. The confidence at present is based on the theory that the copper content of the rock will increase in the next 250 ft. at the same ratio shown in the last 150 ft.

Custer.

In the vicinity of Custer, individuals and companies continue to take out both scrap and plate mica. The Old Mike mine, which was closed down for a time while disputes as to ownership were settled, is again a steady producer and regular shipments are being made.

The Cuyahago Co. has recently shipped a car of ore, which carries a high per cent of sulphur and some copper. Preparations are now under way for the installation of a new hoist and the deepening of the shaft. After this has been completed regular shipments of the ore will be made.

Hill City.

The Hill City Producer's Co. is busy developing its numerous leases and getting the plant in shape for the treatment of the tungsten ores. It is expected that the mill will be ready to handle ore by Aug. 15. The properties throughout this district are being thoroughly developed and as soon as the mill is ready considerable custom ore will be treated.

B. C. Yates, assistant superintendent, and A. J. M. Ross, general foreman of the Homestake mines, are visiting mines in Alaska.

TENNESSEE.

Del Rio.

E. D. Stone, formerly mineral agent Southern railway, and J. H. and W. F. Aldrich of Birmingham, Ala., have associated themselves as copartners operating as the Pond Ridge Barytes Co. for the purpose of mining extensive deposits of barium sulphate in this vicinity. Their output is about 100 tons per day.

UTAH.

Antelope.

The Jeanette Copper Mining & Milling Co. has recently been formed and with about \$57,000 are now developing property located in the north backbone of the Uintah basin, and is reached by a good automobile line from Rock Springs, Wyo., south 55 miles. The company owns an outcropping ledge of 22% copper. The officials are: J. Tom Fitch of Helper, president; F. B. Hammond of Moab, vice-president; C. R. Jones, secretary-treasurer, who with Arthur Gibson, ex-Sheriff George A. Storrs and W. H. Griffin, Jr., make up the directorate. The company has 1,000,000 shares, 20 cts. par value. The treasury stock has all been sold and there

is a cash surplus of \$57,000. It owns 34 unpatented claims. The property has been opened by 1000 ft. of tunnels, shafts and open cuts. Upwards of \$10,000 has been expended in work. The main ledge stands up from the surrounding country rock 30 ft. What were considered fair samples gave average returns of 22% copper, 20 ozs. silver and \$3.20 in gold to the ton. This ledge is persistent and is 15 to 20 ft. wide. Some time ago a lot of 23 sacks from the ledge was shipped and carried 22% copper. A force of 7 men has been working since last April. The expectation is to at once increase the force. It is the expectation to at once plan for a flotation mill with a capacity of 150 to 200 tons. Probably 5 tons will be put into 2 by concentration. Owing to the long haul the ore must be concentrated to be handled profitably. It is likely that a line of trucks will be put on. The road is excellent to Rock Springs, the nearest railroad point. There is a shaft 100 ft. deep from which there is a 100-ft. drift, a tunnel in 95 ft., with only 40 ft. to the ledge, an incline down 35 ft., another shaft 20 ft. with a 30-ft. drift, besides 10 to 35 ft. of work on all the other 34 claims.

Park City.

Recently returning from inspecting the Silver King Con. R. R. Morris says: "The ore is developed in a bedding plane between the 1550 and the 1700 levels. The first-class ore is developed there for about 400 ft. along the strike. The ore will average 4 to 5 ft. wide. The ore is averaging \$60 to \$65 a ton, gross, as it is broken and shipped. The present output is 70 tons a day. The new tramway is making progress. It will be 10,000 ft. long and should be completed by Aug. 15. Most of the towers are up. The mill will be ready about Sept. 1. It will work over an old second-class dump of 25,000 to 30,000 tons. The present production of ore is from development. There is no effort whatever being made to stope the ore. When the tramway is completed the company will ship 75 tons daily of first-class, in addition to 50 tons of second-class. Recently the sulphide ores have been averaging near 45 ozs. silver and 30% lead, the carbonates, 50 to 57 ozs. silver and 30 to 36% lead.

Beaver.

The shaft at the Moscow mine has been completed to the 1000 level. The work of drifting out and connecting up with the old productive workings to the west will be taken up immediately. All during this piece of work the old stopes have been made to produce about enough ore to meet expenses. During the month of June the company shipped a total of 6 cars. Considerable of this was cleanup ore and carried only about \$700 to \$1000 a carload of 50 tons. However, some of the better grades of copper ore brought net as high as \$2550 a car. Cars averaged more than 9% copper. The new shaft was first sunk to the 800-ft. level. Here connection was made with the old workings. Later the sinking was resumed, and now this task has been accomplished. This new shaft on the east side does away with unnecessary wagon hauling and will add greatly to the profits of the company. It has been completely electrified. At present a force of 30 men are employed. It will take some little time to connect up on the 1000-level with the old workings. This will give additional depth under the old stopes.

H. S. Joseph, managing director of the Cedar-Talisman, states: "We have 50 tons of lead ore in the bins and 50 tons at the Salt Lake markets. In addition to this we are extracting some high-grade zinc ore." Joseph now has 10 men at the property, 6 of whom are working on ore. Lead ore has been found on the 100 level, the 225, 600, 700 and 800 levels. That on the 800 is the deepest that lead has yet been opened in the Cedar. This makes a continuous lead showing for 800 ft. on the strike of a regular fissure vein. The ore varies from 1 ft. to 2½ ft. There is a winze from the 225 level which has been sunk 50 ft. in ore. Recently the mine has been wired for electric lighting.

Cottonwood

A compressor and drills have been installed at the Reed's Peak property. Two shifts are working in the tunnel. It is headed for the intersection of the Birthday No. 1 fissure, with the main north-south fissure and according to the calculation of the management it should be reached with a few shifts' work. In and near the intersection is where a

big ore body is expected to be found. The holdings consist of 21 claims situated in South Fork canyon, Big Cottonwood district, about 2 miles north of the Cardiff mine. The property is well situated for being thoroughly developed by the tunnel that is being driven and which has penetrated the mountain for 850 ft. A depth of 500 to 600 ft. has been gained in that distance.

WASHINGTON.

Spokane.

According to James A. Welch, president, the Norman Mines Co., operating the Last Chance and Great Western groups, 6 miles from Northport, will construct a mill this fall to handle the lower-grade ores from both properties. Experiments have been conducted for some time by Harry W. Newton, the company's assayer, and it is recommended that a plant be erected that will cost \$6000 and recover from \$15,000 to \$20,000 from the large dump at the lower terminal of the tramway. No crushing machinery will be necessary at this time, but the company plans to increase the milling efficiency with funds derived from treatment of this dump. It is also announced that the company has just entered into a contract with the Ozark Smelting & Mining Co. at Coffeyville, Kan., by which it will forward 1000 tons of lead zinc ore at a net profit of \$22.50 the ton. This ore is now being loaded at Northport and the entire consignment will be out before the end of August. Shipment of ore of higher grade than heretofore forwarded will necessitate sorting and storage of low grade. The latter will, however, be put through the new mill at a profit, as it carries an average of around 9% lead. About 30 men are now on the payroll, of whom perhaps 10 are engaged in sorting over the old Last Chance dumps. A new 15-h. p. gasoline hoist, just installed at the Great Western, is running smoothly and the winze is down to the 85 level in a fine body of ore. At the 100 level drifts will be run each way and stoping commenced.

"The reorganized company that recently took over the Copper King mine, adjoining the United Copper, announce that shipments of the ore already broken down in the stopes will begin soon. The tonnage available is not definitely known, but it is considerable and, basing an estimate on the first 5000 tons shipped from this property by the old management, it should run about 2.5% copper and some gold and silver. This should leave a fair margin of profit after defraying all expenses.

"The Security Copper, also adjoining the United Copper group, and situated about 2 miles from Chewelah, comprising a surface area of approximately 200 acres, is being steadily developed. The 2-compartment shaft now is down 350 ft. and, with the top work all kept up, good roads established, the camp is well equipped and in fine condition and the company's determination to put the property on a producing basis as soon as possible, it is quite likely that the shaft will be sunk to the 550 level and a crosscut run from the 500 station to and across the No. 4 vein before November. There are six veins known to exist in the Security Copper, five of which are very large, and it is believed that these all will be opened by the proposed crosscut.

"Development by contract is under way on the Chewelah Con. group—a lead-silver proposition—while the others produce copper principally, with some gold and silver, with the exception of the Blue Star, a high-grade lead-silver producer, now being operated under lease, from which shipments have been made recently. At the White Cat a force of miners is employed sinking on the vein, and more extended development will depend upon the results of the present work. The holdings cover several hundred feet of the United Copper vein and are regarded as among the most promising in the district.

"At the Lookout, lying south of the White Cat, which also is believed to cover an extension of the United Copper vein system, a shaft now is being sunk and already is down to the 200 level. Recent operations at the Hecla have been confined to drifting on the vein encountered in the shaft and

some excellent ore has been opened. The management intends to continue development, however, and it is probable that the crosscut will be extended to the second vein toward which the level originally was directed. The equipment is actuated by an excellent steam power plant, and good progress is being made.

"A faulty pump resulted in the flooding of the workings at the Juno-Echo property recently, but a new pump has been ordered and as soon as it is installed work will be resumed in the crosscut toward the vein, begun a short time ago. The shaft on this property is being sunk by two shifts. A heavy flow of water has been encountered in the tunnel being driven to cut the vein of the Copper Cliff holdings, on the east slope of Quartzite mountain. The bore now is in several hundred feet, and the influx of water, together with marked changes in the character of the formation showing in the face, indicates the proximity of an ore body.

"The outlook for practically all the companies, both development and operating, in the Chewelah district is decidedly promising, and within the next year there undoubtedly will be a number of new shipping properties added to the list. Lack of capital to properly finance development and exploration is all that has prevented the camp from becoming recognized as one of the important copper regions of the west, but this difficulty gradually is being overcome, and nearly all the interests represented there have funds to carry their plans to a successful conclusion."

The Electric Point Mining Co., which owns and operates the Electric Point mine, near Northport, has closed a 1-year contract for its entire output with the Consolidated Mining & Smelting Co. of Canada, the ore to be treated at the smelter at Trail. Shipments are to be made at the rate of 75 to 100 tons daily, and the clean sulphide ore is to be kept separate as much as possible from the carbonates. All ore running less than 60% lead in car lots is to be classed as carbonates and will take the lower freight and treatment rate provided in the contract. Settlements are to be based on the New York price for silver and the American Smelting & Refining Co.'s quotations for lead. "Developments at the Electric Point property have been very encouraging lately," said Jesse M. Hall, field representative for Walter Nicholls of Spokane, head of the local syndicate that recently acquired a fourth interest in the Electric Point Co. "The No. 2 ore chimney is proving to have all the characteristics of an ordinary ore shoot instead of being a chimney of ore. Where crosscut on the 225 level it shows a width of 33 ft. and a drift has been run in both directions at nearly right angles to the crosscut, which is now 65 ft. long, and with both faces still in ore. The bulk of the vein filling throughout these workings is a mixture of carbonates and crystallized lead running from 30 to 58% in lead, according to the percentage of crystallized lead disseminated through the carbonates. The clean galena and crystallized lead, which together constitute 25 to 30% of the vein matter, average 75% in lead. The drift to the No. 3 chimney is nearing that ore body and is following a streak of fine carbonates containing occasional bunches of solid galena. When I left the mine a 5-ton motor truck with a trailer was hauling ore from the mine to the bunkers at the foot of the hill and nine 4-horse teams were hauling from the bunkers to the ore bins on the railroad at Boundary. We have started work on the Gladstone adjoining group with 5 men, which will be increased to 10 in 2 or 3 days. We have opened several showings of iron ore and lead carbonates containing boulders of galena. These veins vary in width between 2 and 4 ft."

WISCONSIN-ILLINOIS.

Highland.

The 100-ton power and concentrating plant built for the Saxe-Lampe Co. by the Galena Iron Works Co. will be given a trial run next week. Arrangements have been made with buying interests to take all output. Another 200-ton milling plant is nearing completion for the New Jersey Zinc Co. and it is expected to be going before Aug. 15. Two-compartment shaft 8 by 18, with cages, is in an immense ore body

extensively proven with drills. Recent shipments of carbonate zinc ore is coming from waste heaps thrown up by the miners of two generations ago. The lands now owned by the New Jersey Zinc Co. are being swept clean in this manner. The Minter, Lynch, Franklin, Edwards, Leuke and Kennedy lands owned by this company remain to be mined underground, following mainly the workings left by the former owners. Drills are at work upon the Hying land for the New Jersey Zinc Co. Blue River Bottoms Co. is another operating concern turning bottom lands, where years ago miners discarded as worthless, the ore now is in excellent demand for the manufacture of oxide zinc. Several cars of carbonate and complex ores are ready for shipment. Waters-Fecht Co. hold 2 cars awaiting bids. Burrichter Mining Co. hold 1 car of each, carbonate, lead ore and blende. Winkers Mining Co. offered 3 cars of high-grade carbonate zinc ore last week. Several small operating companies, sub-lessees of the St. Anthony Mining Co. on Sec. 5, hold 1 or 2 cars each of carbonate zinc ore. Pusch, Hudek, Topp Co., local producers, offer 3 cars of top-grade carbonate zinc ore and 1 of blende. Kroll Mining Co., recently incorporated, capital stock \$25,000, is raising zinc ore under new management.

Linden.

New York mining men have secured a 90-day extension of option on the producers operated here by the Saxe-Pollard Co. of Milwaukee. In the deal are listed the Gilman, Glanville, Hinkle, Weigle-Jacobs and Jewell properties, the consideration being \$300,000. The extension was granted to enable the exercise of the option with Campbell-Boston type of magnetic zinc ore separator plant which is to be supplied immediately, agents of the manufacturer having been on the ground. Low-grade zinc ore producers of this field, and they are many, have received serious set-backs recently on account of prices, and the magnetic zinc ore separating plant is coming to be recognized as indispensable. The Gilman and Glanville mines alone recover 2 cars of zinc concentrates daily. Contract with the Linden Zinc Co. on this production up to 46% assay zinc content, expired 2 weeks ago and has not been renewed. All other low-grade producers, and in this class are assigned producers whose output assays below 50% zinc content, have been without a market for nearly 2 months, and a conservative estimate of ore held in bin exceeds at this time 3000 tons; and for the entire field in excess of 10,000 tons. Drilling machines resumed work of exploration on the option on the Saxe-Pollard mines, meeting with exceptionally rich strikes on the Gilman mine. A new producer is being brought in on the Wickes land, where a company recently incorporated is building a new power and milling plant. The output is protected, the promoters having practically concluded to deliver the entire output to one of the leading zinc ore refineries now engaged in the Cuba district.

Platteville.

A new producer is the Block-House mine. The leasehold obtains on lands formerly known as the Cruson-Kistler-Stephens Co. Incorporators have a fine 200-ton electrically driven plant on this land. At present an output of 1 car daily is maintained, the crude ore being provided with separator facilities at two points locally, one the Enterprise Separating Works and an independent Mathey type of separating plant installed years ago at the Homestead mine, owned by the Shepherds. The efficiency of the plant was raised considerably by the additional installation of Dines machines. The Climax Mining Co., another of the recent developments of the Kistler-Stephens combination, has in operation the Homestead mine and plant, and has also resurrected the Grant County mine in which a score of different incorporations have lost their capital madly endeavoring to pick up the giant Empire range noted for its richness some 10 years ago. It is now declared that the Grant County has opened up on this range and will become a wonderful producer. The same combination, all local, have purchased 113 acres of land known as the W. F. Weigle farm, and big ore bodies are being cut for active mining. Another producer has been developed for this company on the Alderson farm. A new producer for another company known as the Bell Mining Co. is developed and producing ore and a plant is being supplied

from second-hand material taken from the Enterprise mill. Several new incorporations are at work with good results, drills are in operation on five leaseholds near the zinc bearing areas and new companies have been organized, leaving this district in the best shape it has ever known to become a really great zinc producing center.

Cuba.

An improved tone in the spelter market rejuvenated zinc ore prices, substantial gains being recorded early in the week. This was shown in heavier shipments to zinc ore refineries, proving that low-grade independent producers were given a little more consideration, while mines affiliated with these refineries unloaded heavier shipments than reported for last week. The Linden Zinc Co., zinc ore refiners, have taken over the Campbell Magnetic Zinc Ore refinery at this point, with two relays of men to operate the plant, and 2 cars of low-grade ore came from the Standard Metals Co. for a try-out. The plant has been operated off and on for the past 5 years and is now under the management of Chas. Singer, an expert in the dressing of ores, who was in charge of the same type of plant at Linden, where ore values have been brought up to premium grades.

The National Separating Works have discarded the old coal-firing method and have put in a gas producer that is operating perfectly for heating low-grade ores preparatory to crushing and separating. Much time is saved and a gain in output of the high-grade finished product is claimed.

Utt-Thorne Co., operating the Lawrence mine, have been shipping regularly to the Benton Roasters. Standard Metals Co. is negotiating with a local foundry for the early construction of a zinc ore separating plant at the Anthony mine. Nearly all the mining companies in this field are beginning to realize conclusively that the only solution of low-grade zinc ore production to meet the markets at all times is the magnetic separating plant. Current is now available at all points in the field through two exclusive power projects, one at Galena, and the other at Mineral Point. Another 6 months, it is believed, will witness the shipment out of the field entirely of high-grade refinery product.

WYOMING.

Casper.

With the expectation of finding oil when the Wall creek sand is reached, interest in the partially developed Muddy field is increasing. Well No. 1, section 3, which was brought in by the Standard Exploration Co. for the Merritt Oil & Gas Co., is being cleaned out. Drillers will go deeper into the oil sand. They were only down 70 ft. when oil was struck. The well is now flowing about 25 bbls. daily and the head comes off at about the same time each morning. For 2 weeks it flowed for about 20 minutes starting at 7:30 a. m. and quitting for the day. Considerable tankage has been made ready to hold the oil when the well is deepened into the sand formation.

The Wintesides Co. has completed the erection of the new wooden rig to take the place of the steel one which collapsed about July 3 on their deep test well. It has resumed work. This is the first attempt to be made to reach the lower, or Wall creek sand, from which the geologists expect much in the way of production. They think that the oil found in the Big Muddy sand is but a seepage from the lower sands and that when these are reached the main oil body will be tapped.

CANADA.

BRITISH COLUMBIA

Salmo.

The Emerald mine, in the Sheep creek district, idle since June, 1915, has been reopened under the management of John Waldbeser, with 10 men, and the force soon will be

increased to 20. It is the intention of the management to resume shipments of high-grade lead ore to the Trail smelter. About 5 tons a day will be shipped, most of this coming from development work, while the second-grade ore encountered in course of development will be left in the mine to be removed for milling at a later date. Last May an option was given covering the stock of Iron Mountain, Ltd., which company owns the Emerald mine, to Spokane parties. The time limit on this option has expired and Waldbeser and his associates express their satisfaction over the fact that the option was not exercised. Mining men who have examined the property are agreed that the Emerald is one of the most promising mines in the district, a contention that is amply borne out by its reputation as a steady shipper during the past 10 years.

J. L. Bruce of Butte, Mont., spent a few days in this district looking over the Hudson Bay mine which is controlled by the Hayden-Stone-Jackling and Butte-Superior interests, last week.

M. W. Bacon of Spokane inspected work at the Hudson Bay mine last week in company with R. K. Neil. Bacon returned to Spokane while Neil expects to spend some time in and around Salmo. He expects to make a trip into the Bayonne district soon to examine some promising prospects in that section.

The Hudson Bay mine is now shipping lead-zinc ore to Mineral Point, Wis. W. R. Salisbury, who has the contract for hauling the ore from the mine to the point of shipment, Salmo, has 36 head of heavy horses and a Yuba traction engine hauling ore now.

Wm. Barbour, an old time prospector of this camp, just brought in some samples of high-grade silver-lead ore from Summit creek in the Bayonne district. Only for lack of transportation facilities it is said there would be some good shippers from that district.

There are on the way from Spokane now due to arrive soon in Salmo, 15 pack mules to be used in packing ore from the Spokane group of claims owned by Laib Bros. This group is situated on the east side of the summit between Sheep creek and Kootenay lake, about 9 miles from the Motherlode mill, to which point the ore will be packed and from where it will be hauled on wagons to Salmo and shipped to the smelter at Trail. About 2 tons of ore a day will be brought out. The ore is a high-grade silver-lead containing some gold values.

Trail.

The zinc output at the Consolidated Co.'s electrolytic plant in connection with its smelter, soon will be increased from 15 to 20 tons a day, and by Aug. 1 it will reach 30. Recently the company shipped 250 tons of pure zinc to Great Britain. Two other departments which were recently added to the Trail smelter were copper converters and a copper refinery. The former have been in operation for some time turning matte into blister copper, and now the refinery also has been put in operation. President J. J. Warren announced that the company would be shipping refined copper at the rate of 35 tons daily by August, at latest. Manufacture of hydro-fluosilic acid also has been begun by the company. The plant is operated in connection with that recently established for the manufacture of sulphuric acid. Both acids are being manufactured, primarily, for the company's own use, large quantities being required in its zinc, silver-lead and copper refineries. Hydro-fluosilic acid was formerly purchased by the smelter at Pittsburgh. Sulphuric acid was obtained in Victoria.

Silverton.

The Standard Silver-Lead Mining Co. on Aug. 10 will pay the regular monthly dividend of 2½ cts., or \$50,000, to stockholders of record Aug. 1. This will make the disbursement for the current year \$400,000, and will increase the grand total to \$2,200,000, or 10 cts. a share more than the par value of the stock. Encouraging news is received from the mine about the disclosure of ore bodies carrying considerable galena in the new workings in the Alpha ground above the No. 1 level of the Standard mine proper. No change of significance has occurred recently in the lower workings of the Standard itself.

ONTARIO.

Cobalt.

During June Nipissing mined ore of an estimated value of \$291,669 and shipped bullion from Nipissing and Custom ores of an estimated value of \$193,403, according to the monthly report. Development was principally sinking at three points for opening the ground for exploration at lower levels. Sinking the winze on vein 102 in 96 tunnel was continued to a depth of 170 ft., at which point keewatin was encountered. A station was put in at 155 ft. and crosscutting to the vein is now in progress. Future work in connection with veins 102 and 96 will be done from the 90-ft. and 155-ft. levels. At 81 shaft, the station and preliminary crosscuts were completed at the 520-ft. level and sinking was resumed to 575 ft., at which point the shaft encountered keewatin. The character of the rock between 520 and 575 ft. does not appear favorable for deposition of ore. Crosscutting to the Cobalt Lake fault-vein is now progressing at the 425 and 520-ft. levels. The vein will be reached at the 425-ft. level before the end of July. Work at 80 shaft was mainly confined to sinking the new winze at the 200 level, from which a large area of favorable ground in the southern portion of the lot will be explored. The present depth of the winze is 186 ft. The 2nd level is now being put in at 180 ft. Keewatin is expected at 193 ft. The first level station is in at 115 ft. and as soon as sinking has been completed crosscutting at both levels will be started. Some stoping was done on a branch vein.

Boston Creek.

The shaft has been completed to the 200 level and drifting started at the R. A. P. Syndicate property. Two shifts are drilling and three mucking. The intention is to drift 300 ft. west, after which a crosscut will be started to cut a parallel vein about 200 ft. distant, in the swamp, to the south, and a showing 12 ins. wide on surface. It is proposed to raise a vertical shaft from this crosscut for ventilation. At a depth of 35 ft. the main ore shoot was first located in sinking. The width at that point was 10 ins., but assays from it gave as high as \$730 gold. The shoot cut off to the east and was again picked up in a drift on the 100 level. Assay values as high as \$61 were obtained at the latter level and at this point the ore shoot was found to have widened out to 6 ft. It is hoped to again locate this at the 200 level in the east drift. On the west drift at the 100 level an ore shoot 12 ins. wide and of a good grade was found and it is hoped to pick this up also on the 200 level in the west drift. Drifting will go on east and west as on the upper level. On the 100 level 175 ft. of drifting has been done to the west and 225 to the east. The syndicate will ship some of the high grade ore and a bumping table is being put in for separating it. It is expected that shipments will be started about Sept. 1. Nothing definite has been decided upon regarding a mill as yet, because the ore body has not been investigated thoroughly enough.

Porcupine.

The Triumph Mining Co. is operating the Success Gold Mines, Ltd., on an option. Three shifts are working and about 60 ft. of crosscutting each way has been done from the 300 level, the lowest point reached. The Triumph began operations on March 3 last. Free gold was found at several points in the sinking of the shaft and in many places assays of as high as \$1.25 a ton in gold have been obtained from the country rock adjacent to the vein. The indications are of the best, and with good showings at upper levels it was considered advisable to go deeper and carry on exploratory work from the 200. The company has a steam-driven compressor plant, purchased from the Jupiter. Two drills are being used, crosscutting both ways from the shaft, north and south. The 100-ft. level assays of \$8.80 were obtained. The vein there was broken up, however, and the crosscut row being continued from it is hoped to pick this up in the lower level. The rock has been giving low assays all the way down. The shaft was sunk at an incline of 62°. The vein followed the latter for 49 ft., when it cut out. At a depth of 10 ft. one assay as high as \$23.80 was obtained. A number of narrow stringers or bands have been cut in crosscutting and these seem to give fairly high assays.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallography, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

Year.....	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Until the past day or two the situation in copper presented nothing of a noteworthy character. Business was wholly lacking, neither resellers nor first hands reporting even inquiries from consumers. There has come a change that may mark the beginning of a renewal of activity. Some good inquiries are said now to be in this market and at least one of the larger selling interests has been offered business on the condition that concessions are made. Up to the present time this dealer has rejected the bids, and, as middle class of producers seems more inclined to put their prices nearer the views of consumers, the business tendered may be secured by them. Although the leading producers and sellers continue to quote 29 $\frac{1}{4}$ cts. for October and 29 cts. for November-December, these are merely nominal quotations, as no contracts have been closed at them for weeks past. Among resellers there is a well defined appearance of weakness which finds expression in current reports of offerings for forward delivery at price concessions.

It is contended, however, by usually well informed authorities that a really large order could only be covered by the principal interest, and if such business is placed it would be on the basis of the figures now quoted by that factor. The view prevailing with consumers is that the chief sellers are maintaining their prices at the present high level because they sold larger quantities of copper months ago at or near the figures now quoted, and that their present attitude is assumed as much for the protection of the buyers of those lots of the metal as for any other reason. But the continued dullness of the market seems to have got on the nerves of second hands, with the result that offerings have been heard of at 24 $\frac{1}{2}$ @25 cts. for spot and nearby electrolytic.

At the same time there are reports that some of the producers are ready to close July-August contracts in fairly large lots at 26 $\frac{1}{2}$ cts., and later months at 26 $\frac{1}{4}$ @27 cts. To consumers in general, however, such offerings do not appeal and although a considerable amount of buying remains to be done by them they display no inclination to hasten purchases, except in the instance above noted. A reason for this is found in the belief quite widely entertained that the continued absence of the foreign buying interest which has hitherto been the dominant sustaining factor is inevitably making for a decline in market values of the red metal.

Among certain observers the apparent weakness of resellers is attributed to the usual end of the month influences, which are apt to operate even in normal times, namely, the desire of those who have overbought to liquidate some of

their holdings. These second hands, who are consumers, have come into the market to sell their surplus, is the contention, so that the abnormal condition of spot copper selling under futures is the result.

A representative of one of the principal dealers in commenting on the prevailing abnormal price conditions, said that, in view of the large buying movement which ended some 2 months ago, he did not consider it as unusual. "These are abnormal times," he continued, "and we must look for extraordinary conditions to prevail. The larger interests, because of their sold up condition, as indicated by their bookings, do not feel that any change is necessary at this time. There is much business in sight and this must come sooner or later."

"When a buying movement actually starts again it is not at all unlikely that another rush in prices will be witnessed. Some of the users of copper in this country have been holding off, it is true, but they are gradually getting into a position where they will be forced to buy regardless of prices. Whether they will purchase sparingly on the hand-to-mouth basis or for some time in advance will depend in my opinion by the condition of the market at the time they begin their activities."

In London electrolytic copper displayed marked weakness during the earlier part of the week, but later recovered somewhat, going from £121 back to £122. Standard copper in the English market has further advanced 10/- within the week, closing firm.

Quotations for copper per pound at New York for the week ending July 26 were as follows:

(For Thrd Quarter Delivery.)

	Lake.	Electrolytic.

Tin.—A somewhat brighter hue has been imparted to the prospect by a renewal of buying interest the past week. A fair amount of business in futures has been consummated and some sales of spot tin have also been put through. Buyers were attracted by the lower range of values reached after the recently protracted decline, but holders were prompt to raise their quotations on receipt of orders, while London and Singapore followed with a proportionate advance. In some quarters the belief is entertained that the end of the bear raid has been seen, but on the other hand, while the market may remain firm, consumers have indicated that they will not go much above the present quotation in the condition of affairs now obtaining. It is pointed out that tin is arriving freely, as a result, no doubt, of absence of difficulties encountered in the securing of export permits, while users are insured against a sudden shortage by their substantial holdings bought a while back. On this basis it is held that they are in a position to keep prices from advancing unduly.

As a matter of fact, prices have receded a little from the high point of the week. Futures have advanced during the interval to 38¼ cts. for August, 38 cts. for September, 37¼ cts. for October, 37¼ cts. for November and December. The premium on spot over the late months is now only ½ ct., which is asserted by sellers to indicate the firmness of the latter.

The advance in the foreign market has not fully covered the losses sustained on last week's slump. Singapore closed with week at £171 10s, showing a net gain of £6, while London advanced £2 5s on spot tin.

Quotations on tin per pound at New York and per ton at London for the week ending July 26 were as follows:

July	New York		London		Singapore.
	Spot.	July.	Straits, spot.		
20	41.00c		£169 10 0		£166 0 0
21	38.75c		168 5 0		170 0 0

Lead.—The dullness in the spot market has been relieved somewhat by business on export account, but at the expense of much cutting of prices by outside sellers. The domestic consumers are well covered for this month and are waiting for a readjustment of prices in August, which they believe to be inevitable. The absence of new munition business that would require the use of lead is counter to the hopes of sellers, who had expected a renewal of buying for war purposes. Statistically the position of lead is held to be excellent. Stocks are at a low point and are now accumulating, according to all accounts, for producers are averse to letting them accumulate. When consumers do not come forward producers go after them and cut prices to the necessary extent to bring business. That is indicated by the fact that on the late buying Missouri producers were the cheap sellers. But when consumers are in need of lead for prompt delivery

they are likely to have to pay stiffer prices, at least on anything other than Missouri brands. All of which reflects the limited extent of stocks on hand.

The recent export transactions, according to some accounts, covered a considerable amount of lead, Canada, as well as Europe, doing the buying. The fact that the American Smelting & Refining Co. has not changed its quotation is accepted as an indication that its present price of 6.50 will be continued during the balance of the month.

Quotations for lead per pound at New York and per ton at London for the week ended July 26 were as follows:

July	New York			London	
	Indpts.	A. S. & R. Co.	6.50c	Spot.	Futures.

Lead Ore.—Production in the Missouri-Kansas-Oklahoma district was a little off last week, because of a breakdown at the plant of the Empire District Electric Co. The market was a little weaker than during the previous week and \$70 was the price at which most ore went, though a very small amount brought \$73. There were produced in the district during the week ended July 22 1,835,950 lbs. of concentrates, bringing the total for the year to 60,867,592 lbs., and these amounts had respective values of \$64,166 and \$2,670,681.

Zinc Ore.—With the spelter market again coming to its own, ores in the Missouri-Kansas-Oklahoma district were selling at better prices during the week ended July 22. The top price remained at \$75, as during the previous week, but the lower grades showed strength in that they were in strong demand at \$50 and in general were bringing better prices than during the previous week. There were produced 9,221,150 lbs. during the week and 393,703,693 lbs. for the year to date. The week's production was valued at \$302,092 and the year's at \$18,336,790.

Calamine.—As during the previous week, this ore remained steady at \$40 to \$50 and there were produced 63,470 lbs. of concentrates, with the total for the year given at 19,027,500 lbs. Total values were given at \$1395 for the week and \$704,848 for the year to date.

Spelter.—A rather active demand has developed within the past week. In addition to purchases made by consumers France and Great Britain are reported to be seeking larger quantities of spelter here. As a result prices have taken a pronounced upturn. Today's quotation for spot spelter is 10½ cts. St. Louis, while 10¼ cts. is asked for July, 10 cts. for August, 9¾ cts. for September and 9¼ cts. for delivery over the last 3 months of the year. Authorities who thought that short covering in St. Louis might cause an advance to 10 cts. a pound, St. Louis, and did not believe that price would be exceeded in the near future, have revised their opinion since the appearance of export buyers in the market. They are now inclined to believe that future prices will be determined wholly by the extent to which foreign governments make their needs felt in this market.

It is noticeable that in the inquiries from abroad the higher grades of spelter are inquired for. At the close, while 10½ cts. St. Louis is the generally prevailing market price, some sellers are refusing to accept less than 11 cts. per pound, and they show little desire to fill any large orders for delivery over the fourth quarter at 9¼ cts. per pound.

Quotations for spelter per pound at New York and per ton at London for the week ending July 26 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—The market has remained nominally steady at \$80 a flask since the decline from \$83 a week ago. The situation appears to be that sellers are ready to take advantage of any renewal of demand to advance their pretension, but as the ammunition makers keep out of the market and other classes of consumers are buying no more, if as much as nominally, a further recession of price in the near future would cause no surprise, since there have been some pretty large arrivals recently and second hands are tired of waiting for a higher market.

Antimony.—Although 400 tons have been bought, according to report, by a munition maker, the fact has been without influence to improve the tone of the market, depressed as it is by the heavy stock on hand, and a further decline in prices must be recorded. There are sellers at 14¼ cts. and even that figure might be shaded in some quarters. Offerings at 12½ cts. for shipment in bond from China within a few days are reported to be making.

Nickel.—The situation is without new features. There is a little inquiry for export, but the movement into home consumption continues very slow. Ordinary forms are quoted at 45@50 cts. per pound, as to size and terms of order, while electrolytic commands a premium of 5 cts. per pound.

Aluminum.—Rather more activity has developed and a firmer feeling prevails, with 59@61 cts. per pound asked for No. 1 ingots, New York.

Platinum.—Prices have continued to move downward the closing quotation being \$90, a loss for the week of \$3 to \$5 an ounce, according to seller.

Pig Iron.—The leading feature of the market con-

tinues to be the European demand for bessemer iron, between 20,000 and 30,000 tons having been taken within the past few days, with additional business in sight. The market is very firm, but no higher. Foundry grades remain steady, but are without animation.

Ferromanganese.—There has been no further change in the contract price, the market closing steady at \$1.75 for spot and nearby deliveries. Little business is being done. Spiegeleisen is offered more freely, but is in better demand at \$45@50 at the furnace for 20%.

No. 6. Vol. 45.

CHICAGO

August 5, 1916.

OPEN CUT WORKINGS OF UTAH COPPER PROPERTY—LARGEST COPPER DIVIDEND PAYER IN 1916.

\$137,849,595 in Dividends by Mines and Works in Half Year

By GEO. E. SISLEY.

The resourcefulness of American mines and works was never better demonstrated than by operations during the 6 months of 1916 ending with June. To meet the enormous demands for the various metals production was speeded up to the limit and there resulted a production far ahead of all previous records.

As a result of this great production dividends were paid well beyond the imagination of the most optimistic. From reports received by Mining and Engineering World, and they were never before so complete, American mines and works made disbursements well nigh unbelievable. For no less than \$137,849,595 was paid by 147 companies which look for their profits from mines and works, during the half year period. When in the year 1915, mines and works disbursed \$110,047,145 in dividends it was considered an achievement little short of wonderful. During the first 6 months of 1916, however, disbursements totaled over seven million dollars more than was paid out in dividends during the entire year 1915. In the 1916 disbursements mentioned above 147 mines and works and seven securities-holding corporations participated. As an evidence of the continued profitableness of mining we are able to prove by tables published elsewhere in this issue, that companies paying dividends during the 6 months of 1916 have to their credit a total of \$1,290,809,797. Add to this the disbursements of companies not paying dividends in 1916 and we have a grand total that is almost unbelievable.

Coppers.

By subdividing the dividends paid by the above 147 companies we find that the copper properties hold the lead in point of dividends, both in the 6 months of 1916 and in total disbursements. According to the reports received there were 30 copper companies participating and these enriched shareholders to the extent of \$57,469,341. Since incorporation these companies have disbursed \$632,997,330, a return equivalent to 182% on their outstanding capitalization. When it is considered that some of these companies have been operating but a few years and have a large capitalization, this return is really remarkable.

Utah Copper ranks as the leader in 1916 copper dividend disbursements with \$8,934,695 to its credit. Since incorporation its dividend payments total \$41,656,592. Anaconda ranks second with \$6,993,750, and to date with the dividends paid by companies it has taken over should be credited with \$171,251,771. Champion of Michigan ranks third with \$3,720,000 and has a total of \$13,720,000. Calumet & Hecla, ranking only fifth for the year, is second to Anaconda in total disbursements with \$132,250,000 to its credit.

Gold-Silver-Lead-Zinc.

That the gold, silver, lead and zinc companies had a profitable half year is shown by the fact that, with 103 companies contributing, no less than \$47,363,484

MIAMI COPPER PROPERTY, ARIZONA.

was passed to stockholders. Since incorporation these companies are credited with paying dividends totaling \$318,656,113, on an outstanding capital of \$277,342,547. The extent to which the zinc producers benefited by the great demand for spelter is shown by the fact that five of these companies contributed over one-half of the \$47,363,484 above mentioned, or \$29,321,963. New Jersey Zinc leads with \$18,200,000 in the 6-months' period. Butte & Superior second with \$5,862,093. American Zinc, Lead & Smelting Co., third with \$2,414,000. Hercules fourth with \$1,450,000 and Interstate Callahan fifth with \$1,394,970.

Of the 103 companies of the above class 80 operate properties in the United States and these contrib-

uted \$41,846,976. To date these companies have paid dividends totaling \$246,576,300. Twenty Canadian companies paid \$4,744,561 and to date \$63,657,026, about six million less than issued capitalization. But three Mexican companies report dividend payments, these disbursing \$771,948.

Metallurgical and Holding Companies.

Six metallurgical companies disbursed \$12,356,066 during the half year, and to date are credited with total disbursements of \$206,014,636.

Seven securities-holding corporations disbursed \$20,600,604 during the 6-months' period. \$10,713,455

OLD DOMINION PROPERTY, ARIZONA.

Standing of the States.

In connection with the great dividends paid by mines and works there is much of interest in what share the various mining states have taken in providing stockholders with such magnificent dividends as those paid during the last 6 months.

New Jersey, with only one company participating, leads all other states in disbursements for the 6-months' period, having divided among its few stockholders no less than \$18,200,000. What its total dis-

bursments amount to cannot be ascertained, as the officials have placed an iron-clad censorship on all matters pertaining to dividends. It was only in May that the company first unbosomed itself to stockholders as to its operations, issuing at that time a brief quarterly report.

Montana is second for the 6 months' period, with seven companies distributing \$14,583,905. Since incorporation these seven companies have divided among shareholders \$197,830,967. This on an issued capitalization of \$129,642,580 is a return of 154%.

Michigan, with 10 companies contributing is third, having paid dividends during the half year totaling \$13,473,853. In total dividends paid by companies paying dividends in 1916, Michigan ranks first with disbursements amounting to \$224,554,077, a return on issued capital of \$62,303,850 or 360%.

Arizona ranks fourth with 11 companies paying \$11,089,736, with total disbursements of \$111,594,322. This on an issued capital of \$88,763,033 is a return of 125%.

Utah with 19 companies participating ranks fifth with \$11,089,736 on the issued capital of \$47,511,442, a return of 181%.

The following table gives the standing of the various states, the amount of dividends paid, and the per cent returned on outstanding capital.

	No. com-panies.	Issued capital.	6 mos. of 1916.	Total.	% return.

The Half Year in the Stock Market.

Despite the great profits earned by American copper companies, in fact, the greatest in the history of the industry, stocks of these same companies have not responded accordingly, as compared with the high and low of 1915, prices on June 30 in but few cases showing gain over the high of 1915.

In the table following is shown the price range of the leading copper stocks on the New York and Boston exchanges for 1916 to date and the 1915 year; also the present market with net change since Dec. 31, 1915:

	1916		1915		June 30.	Change.

*Ex-stock dividend.

One of the developments of importance to Montana mining interests in recent years has been the great increase in the generation and distribution of electric power, to serve the principal producing interests of the state.

THE DIAMOND MINE OF THE ANACONDA CO., MONTANA.

Six Months of Wonderful Prosperity for United States Mining

The half-year in the mining industry of the United States was productive of a prosperity never before equalled in the history of the industry. In nearly every branch, discussed in the following reviews by representatives of the Survey, there is reported increased production at higher prices for the metal.

Copper Production Continues Heavy.

Under the influence of large demands and resultant high prices the production of copper during the last 6 months has exceeded that of any equal period in the history of the industry.

There has been a steady rate of increase in the output of copper since early in 1915. The production during the last half of 1915 considerably exceeded that of the first half, according to the report by B. S. Butler, and during the year the refineries produced, from both domestic and foreign ores, a total of 1,634,000,000 lbs. of blister copper, of which 1,388,009,527 lbs. was produced from ores mined in the United States.

The price for the period has averaged above the highest price received for copper at any time in recent years, the average for the first 6 months of 1916 being more than 26 cts. a pound. The cost has doubtless increased slightly, as the important copper companies have increased the wages of their employees, but this increase has been largely offset by decrease in cost due to working plants at the maximum capacity. Many small mines are operating that could not be profitably worked under normal conditions and this, of course, tends to increase the average cost per pound.

The profits of the producing companies have been large and as much of the output is sold several months ahead of delivery the prosperity of the industry is well assured for the remainder of the year, so that 1916 will doubtless be the most profitable year in the history of copper production to the present time and possibly for years to come.

Gold and Silver in 1916.

The precious-metal mining industries continued active during the first 6 months of 1916, practically all important mines and mills operating at full capacity. Shortage of cyanide supplies, feared in 1915, was obviated by increased output of domestic sodium cyanide, which has practically replaced potassium cyanide in the leaching of precious metals. Flotation has begun to increase the saving of gold from tailings. There may have been some decrease in gold prospecting during the last 8 or 10 months, as many old gold prospectors have been giving attention to deposits of tungsten, antimony, quicksilver, and other mineral products whose value has enhanced since the outbreak of the war. There was also some labor shortage at mines and mills owing to high wages paid in factories making war supplies.

Final figures of the Geological Survey and the Bureau of the Mint give a total domestic production for 1915 of \$101,035,700 in gold, and 74,961,075 ozs. of silver, valued at \$37,397,300, against \$94,531,800 in gold and 72,455,100 ozs. of silver in 1914. These figures include the gold production of the Philippines, which has been steadily on the increase.

The total output both of gold and silver reported for 1915 was the highest ever recorded under the American flag, but if the Philippine output be eliminated the production of gold in the United States proper was but little above the previous record year of 1909. The output of silver for 1915 was materially above the preceding record yield of 1914. For 1916, from the midyear point of view, the output of gold, which is apparently falling off somewhat as compared with 1915, in Colorado, California, Nevada, and some other states, and increasing possibly in Arizona, Oregon, the Philippines, Idaho, Montana, New Mexico and elsewhere, will probably reach a total somewhat below the high output of 1915. The production of silver, however, will undoubtedly again break all previous records, as the output of silver ores and of the

AMADOR CON. CO.'S PROPERTY, CALIFORNIA.

THE SOUTH HECLA PROPERTY, UTAH, A NEW DIVIDEND PAYER.

SEVEN TROUGHS COALITION PROPERTY, NEVADA.

copper, lead, and zinc ores which produce silver in notable quantities will exceed that of any preceding year, owing to steady demand and high prices for all metals.

Prices of silver were low in the greater part of 1915. The monthly average commercial price at New York, which rose to about 52 cts. an ounce in November, however, reached 55 cts. in December, and climbed steadily to over 74 cts. in May, 1916, but fell to about 65 cts. in June. The sharp increase in prices resulted from strong demand for the Far East at the end of 1915 and abnormally large requirements by the belligerent countries for coinage for the troops in the field. These demands found available stocks low, largely because of the great falling off in the Mexican output due to the long continued disturbance there. With the consequent inevitable rise in prices domestic producers of silver profited greatly, notwithstanding the increased cost of labor and of mining supplies. Silver is in demand not only for coinage, but also for sterling and other silver wares, as well as for drugs and chemicals. The manufacture of silver salts used in photography, particularly in films for hand cameras and cinematographs, has vastly increased in recent years. The midyear outlook indicates continued demand for silver the metal last to benefit by the general domestic prosperity.

Lead and Zinc Mines Promise Largest Output on Record.

The mine production of lead and zinc ores during the first 6 months of 1916 was much larger than that of any preceding 6 months. The lead and zinc mines have been able to produce all the ore needed to supply the increased capacity of the smelters. The ore and concentrates were sold at prices which yielded large profits, notwithstanding increased costs of production and the working of large quantities of low-grade ore which could not be mined at a profit under normal conditions. High-grade zinc concentrates free or nearly free from lead and iron continued to be in demand, and the base price offered for such concentrates was generally much higher than that offered for low-grade concentrates.

The shipments of sphalerite concentrates from the Joplin region during the first 6 months of 1916 amounted to about 180,000 tons, valued at more than \$17,000,000, as against 206,000 tons, valued at \$23,419,000 for the calendar year 1915. The demand was not as active during the last month of the year, when the base price for concentrates decreased nearly \$20 a ton. Unless the base price declines to a point which will prevent the mining of lean "sheet ground" the

DELAWARE MINING CO.'S MILL, NEVADA.

NORTH BUTTE GRANITE MOUNTAIN MINE, MONTANA.

production of zinc concentrates from the Joplin region in 1916 will probably be 60,000 to 70,000 tons more than in 1915.

Development in the Miami, Okla., camp continued to be favorable, and the production should be much larger during the last half of 1916. The increase from Kansas will not be large, for excessive rains have hampered operations. The "soft ground" mines in southwest Missouri have not shown any largely increased yield, but the "sheet ground" has been actively mined and many new mills put in operation. The strike of the hoistmen in the Joplin district reduced the output in June, though few of the mines were

closed down for any great length of time. Some of the mine owners seized the opportunity to make much needed repairs or additions to their plants.

The stock of zinc concentrates unsold in June was larger than usual but probably was not much more than 2 weeks' production. The production of zinc carbonate and silicate showed no great increase, and the galena concentrates sold indicate a production of about 56,000 tons in 1916, or 11,000 tons more than in 1915. The selling price of the lead concentrates was nearly double the average price in 1915.

The large mines in the disseminated lead district of southeastern Missouri were operated steadily, and al-

INTERNATIONAL SMELTER AT TOOELE, UTAH.

though no figures are available for 1916, the output was larger than it was during the first or the last half of 1916.

The number of producing zinc properties in Arkansas increased rapidly and many new mills were operated. The output of sphalerite concentrates was negligible but that of zinc carbonate increased more than 100%. The zinc carbonate is of high grade, and the production of such ore in 1916 in Arkansas will be exceeded only by that of the Joplin region.

The zinc ore mined in New Jersey in 1916 was at least as large as in 1915, and the production from Tennessee and Virginia was larger than in the first 6 months of 1915.

The shipments of raw sphalerite from mines in the Upper Mississippi Valley region steadily increased, and the capacities of the roasting and separating plants were much greater than in 1915. A number of new mines were opened and concentrating plants constructed.

The New Diggings camp was especially active, though development was active in all the other camps.

The shipments of raw sphalerite concentrates

state Callahan, Success, Frisco and other mines were shipping more than 8000 tons of zinc concentrates or ore monthly, which is much more than the shipments in 1915.

In Montana the lead production increased because more lead-zinc ore was mined. The increased yield of zinc probably amounted to above 30%, as the Butte & Superior mine was producing at the rate of 96,000 tons of concentrates yearly and the Elm Orlu at the rate of 60,000 tons.

The reports from all states indicate that the production of zinc ores in the United States in the first 6 months of 1916 was at a rate 25 to 30% larger than that in 1915.

Continued Demand for Quicksilver.

The domestic quicksilver industry has continued active during the first 6 months of 1916, and the average price for the period has been about double the exceptionally high average for the entire year 1915.

Figures just compiled by the Survey show that the

U. S. SMELTER AT MIDVALE, UTAH.

amounted to more than 100,000 tons, compared with shipments of 162,000 tons during the calendar year 1915.

In the western states small increases of both lead and zinc were made in Arizona, Colorado, New Mexico, and Washington. In Nevada an increased quantity of zinc ore was shipped from Clark county and the lead ore shipments from the Pioche, Goodsprings, and Eureka districts indicate a considerably larger output of lead from Nevada for 1916.

In Utah the Bingham district made a record output of lead during the first 6 months of 1916. The zinc production of Utah will probably be only slightly more in 1916 than it was in 1915.

The Coeur d'Alene region in Idaho shipped 30,000 tons of lead ore or concentrates a month. The Inter-

total production of quicksilver in the United States in 1915 was 21,033 flasks of 75 lbs. each, having a marketed value of \$1,826,912, or an average of \$86.86 per flask. Of this output 14,283 flasks, selling for \$1,174,881, came from California, and the remainder almost entirely from Texas and Nevada. The actual average sales value for the whole country exceeded the average market value in San Francisco—which was \$85.80 for the year. In 1914 the domestic output was 16,548 flasks, valued at \$811,680, and therefore the production for 1915 showed an increase of over 27% in quantity and 125% in value.

The increased domestic demand for quicksilver in the last 18 months has been due mainly to war requirements for fulminate and drugs. Early in 1915 domestic stocks began to be drawn upon and production

LEONARD MINE AND SURFACE PLANT, MONTANA.

AJAX PROPERTY, COLORADO.

INDEPENDENCE MILL, COLORADO.

became more active, but as foreign embargoes left the field clear and domestic output was unable to meet the rapidly increasing call for the metal, prices continued to rise throughout the year and into the early months of 1915, the high mark of \$300 a flask being passed in February. Naturally every mine and prospect became of interest. The reaction set in, however, as the high prices drew out quicksilver supplies in Mexico and elsewhere that had been originally purchased for amalgamation of gold and silver ores, and finally as the British Government permitted exports to America under certain limitations. The average monthly domestic price in San Francisco, which had climbed from \$51.90 in January, 1915, to \$295 in February, 1916, dropped to \$219 in March, \$141.60 in April, \$90 in May, and about \$72 in June.

The market remains steady and in general highly profitable, and as domestic prices have dropped below London quotations exports rather than imports of the metal may be expected. There is probably no great quantity of metal stored, and consumption is undoubtedly abnormally large.

Favorable markets have brought out great activity in search for new prospects, and discoveries near Morton, Wash., and Beagle, Ore., in 1916 have led to some development and construction of reduction plants. Also in the Skull Valley deposits, Ariz., and at Black Pine, Idaho, some activity is reported. Many old furnaces have been repaired or enlarged in California, Nevada, and Texas, old workings have been reopened, and new discoveries have been developed.

Very likely the exceptionally high prices of the last few months have led to gouging and robbing many mines of their best ore, and the average tenor of the ore worked by the larger mines during the first half of 1916 may prove considerably below that of previous years. Moreover, some mines have undoubtedly passed their maximum productivity. These conditions are probably offset to some extent by the fact that more furnace capacity is now working on quicksilver ores than at any previous time in the history of the industry. On the whole the midyear outlook is for an output in 1916 fully equal to that of 1915.

Increased Activity in Manganese Mines.

There has been a greatly increased activity among the manganese mines of the United States during the first 6 months of 1916. This activity is shown by the operation of new mines, the reopening of old mines, and more regular production from the mines already active. There is a prospect that the production for the entire year, according to D. F. Hewett, will greatly exceed that for 1915, which was 9651 tons, the largest since 1901. Several discoveries are reported from Arizona, California, Oregon, Utah, and Virginia, and there are new operators in Arkansas, California, New Mexico, Utah, and Virginia.

During the first quarter of 1916 the prices of all grades of manganese ore rose rapidly to the highest figures recorded in 30 years. Prices of 60 to 65 cts. a unit for ore containing 45 to 50% of manganese and more than 1% of iron were freely offered about April 1, and it is reported that 70 cts. a unit, or \$35 a ton, was paid for several lots. During the second quarter prices remained constant at these figures. Large quantities of Brazilian ore continue to be received, and there is a prospect that the imports will exceed those for 1915, which were the largest on record with the exception of one previous year.

Several new producers have entered the ferromanganese field, and although imports from England appear to be greater than last year, it appears that the domestic production for 1916 will be the largest in the history of the country. Prices for ferromanganese for immediate delivery in March reached the highest figure ever recorded—\$425 a ton for small lots—and large quantities were sold for \$350 to \$400 a ton. For delivery within 6 months the price has remained constant at \$175 a ton. During the second quarter prices receded to \$350 a ton for immediate delivery.

As long as the present demand for steel continues there is little prospect for greatly reduced prices of either manganese ore or ferromanganese, and even if peace is declared during the winter prices can scarcely decline to normal for at least 6 months or a year.

Producers of manganese ore particularly should realize that never before for so long a period has there been a better opportunity for the profitable mining of manganese ore. They should realize also that this condition can not continue indefinitely.

The Portland Cement Industry.

The first half of 1916 has been a busy period for the Portland cement industry in most parts of the United States. Labor troubles have caused the temporary shutting down of a few plants in Illinois, and the business ordinarily taken care of by these plants has gone to others in the central states, but none have been reported as having voluntarily closed in 1916.

The opening of a new cement plant nowadays, when the country is so well dotted with plants, is an event of importance, and the fact that two new ones have begun operations is of considerable interest. Both of them are in the middle west, one at its extreme north, at New Duluth, Minn., the other at its extreme south, at Houston, Tex. The location of both was influenced more largely by commercial considerations than by the proximity of raw materials. The plant at New Duluth, a mill of the Universal Portland Cement Co., utilizes limestone brought by boat from the shore of Lake Huron near Alpena, Mich., and slag from the blast furnaces of the Minnesota Steel Co. at New Duluth. The plant at Houston is mill No. 2 of the Texas Portland Cement Co. It manufactures cement from oyster shells dredged from a reef in Galveston Bay and clay from Harrisburg, Tex. This plant is on tide-water, and efforts will be made to establish for it an export trade with South America.

In 1914 and 1915 there was a decrease in the production of cement, consumers exercising strict economy in its use, but the year 1916 shows a reaction, having opened with a demand unprecedented for a midwinter season. Prices, which had averaged only 86 cts. a barrel for the entire year 1915, began to rise toward the end of that year and in the eastern and middle states, where cement sold at 70 to 90 cts. a barrel, they continued to rise in 1916 until, in June, they ranged from \$1.10 to \$1.25 a barrel. The increased prices, of course, do not mean an equivalent net increase in returns to the manufacturers, for the costs of explosives for blasting and of coal have both risen, and laborers are in many places demanding an increase in wages. These comparatively high prices have not, however, checked the demand for cement. Many manufacturers are selling all they can produce, and others are even drawing on stocks so as to fill orders promptly.

Although no statistics have been reported to the

Survey at this date, it is believed that the total output of Portland cement for the first half of 1916 has considerably exceeded that for the corresponding period of 1915. In general an optimistic feeling prevails among manufacturers, and it is confidently predicted that the year will show a gain over 1915, both in production and shipments of Portland cement. Moreover, there is a fair possibility that they will exceed those of 1913 and thus establish a new record.

New Record Established in the Coal and Coke Industry.

The output of bituminous coal in the United States during the first 6 months of 1916 was the greatest ever recorded in any half-year period. Estimates by C. E. Lesher, based on returns from over 100 railroads originating coal and coke shipments, indicate that the production during this period was 261,000,000 tons, an increase of 35% over the first 6 months of 1915, and of 5% over the last 6 months of the same year, and greater by several million tons than the record established in the last half of 1913. Compared with the first half of 1913 the exports from the Atlantic seaboard during the last 6 months have increased about 10%, and the exports to Canada have nearly doubled. The movement of bituminous coal through the Soo Canal on the Great Lakes shows an increase of 80%, and the coal used in coking has increased nearly half. Increased consumption by railroads and by the iron and steel and nearly all other industries has been a large factor in establishing this record. From April, 1915, to January of the present year the production of bituminous coal increased at a rapid rate, with but temporary slackening in November and December, due to car shortage. The output in January, 1916, was more than 60% greater than in April, 1915, and the production in February and March, 1916, was nearly as great. Many large users of coal laid in stocks of fuel in anticipation of a possible shut-down at the mines in April because of labor troubles, and though there was no general strike, the production in April declined greatly as a result of decreased buying on the part of those having stored coal to use. May and June, however, showed successive increases, and there is every indication that the production during the coming 6 months will equal if not exceed the 6 months just past, and that the output in the calendar year 1916 will exceed 500,000,000 tons, establishing a new record for bituminous coal.

Every coal-producing state from Washington to the Atlantic coast has shared in this general increase.

The output of beehive coke has increased from about 11,250,000 tons in the first half of 1915 and 16,250,000 tons in the second half of 1915 to more than 18,000,000 tons during the last 6 months. The manufacture of coke in by-product ovens has also increased as new ovens have been completed and put in commission.

The production of Pennsylvania anthracite increased about 3% over the corresponding period in 1915.

Prosperity in the Iron Industry.

The first 6 months of 1916 in the iron industry showed a continuation of the highly prosperous conditions that prevailed during the last 4 or 5 months of 1915, according to E. F. Burchard. In fact, activity

was even greater in 1916 than in the first half of 1915. Large increases are shown in the output of both iron ore and pig iron. The shipments of ore from the Lake Superior region during the first 5 months of 1916 were more than 10,000,000 gross tons, or 83% greater than those of the corresponding period of 1915.

Ore prices at lower lake ports for 1916 were increased 75 cts. a ton over those for the season of 1915, but lack of boats is reported to have forced concessions in the price of ore from some mines that do not control their lake transportation facilities.

The production of coke and anthracite pig iron in the first 5 months of 1916 showed an increase of 66% over that of the corresponding period in 1915, and prices are from \$5 to \$7.25 per ton higher, or 33 to 40% above those in June, 1915.

Prices for steel bars and beams have increased 100 to 130% over those of a year ago, and if conditions are not adversely affected by miners' strikes now threatening and if the present strong demand for iron and steel continues, the total ore output from the Lake Superior region may possibly reach 60,000,000 gross tons.

Birmingham and other iron districts are not capable of such rapid increases in output as the lake districts, and if 10,000,000 tons be estimated for the production of all other districts it indicates a possible total domestic production of iron ore of 70,000,000 gross tons for 1916. At any rate, there are good indications that a new high record of iron-ore production will be made this year.

Large Oil Production Expected.

The quantity of petroleum marketed in the United States during the first half of 1916 is estimated by John D. Northrop at 140,000,000 bbls. His estimate is moderate and his apportionment of the output among the major fields is as follows:

Field.	Barrels.
Appalachian	11,400,000
Lima-Indiana	1,800,000
Illinois	7,900,000
Kansas and Oklahoma.....	50,500,000
Northern and Central Texas.....	4,200,000
Northwest Louisiana	6,800,000
Gulf Coast	11,400,000
Wyoming and Montana.....	2,400,000
California	43,500,000
Miscellaneous (Colorado, Michigan and Missouri).....	100,000
	140,000,000

This quantity, which includes a little oil actually produced in 1915 but marketed during 1916, is appreciably less than the output during the first half of 1915, though it is greater by about 5,000,000 bbls. than one-half the entire quantity marketed last year. When it is considered that the first half of 1915 includes the period of maximum production of the Cushing pool in Oklahoma and the Crichton pool in northwestern Louisiana the disparity in output between the corresponding periods is not especially significant. The magnitude of this quantity, the fact that it is greater than one-half the total petroleum marketed in the United States in 1915, and the further fact that it reflects the results of general activity throughout all oil-producing areas rather than flush production in restricted areas is, however, significant and leads to no other conclusion than that the final statistics of oil marketed in 1916 are destined to establish a new record.

The outstanding feature of the petroleum industry during the half-year just closed was the high level reached in the prices of crude oil in March and main-

tained firmly to the end of the period. This level involves prices ranging from 90 to 350% higher than those of a year ago for high-grade Eastern and Mid-Continent grades and reflects less strongly the decreased capacity of Cushing than it does the increased demand for crude oil resulting from the activity of a large number of new refineries installed during the recent period of low prices.

As a consequence of the incentive afforded by the high prices in the early part of 1916, activity in drilling increased enormously in all fields with the opening of spring, and though within the half-year period no strictly new pools were discovered there was a development of old pools and new extensions that was attended with gratifying success. So marked was this success in the Augusta and El Dorado pools in southern Kansas, the Blackwell pool in Kay county, Okla., and the Shamrock extension of the Cushing pool in Creek county, Okla., that at the end of the half-year period the production and consumption of crude oil east of the Rocky mountains are essentially in balance and a tendency toward weaker prices for Mid-Continent grades is apparent. Thus far this tendency has affected high-grade crude oil only to the extent of lowering the premium on certain types that are in greatest demand, but its influence on market quotations is inevitable if production continues its steady increase or if the remarkable wildcat campaign now under way in the southwest results in the discovery of even one considerable pool of high-grade oil.

Silver of Today and 25 Years Ago.

The average cost of producing silver from silver mines today, according to a Survey report, is nearly 50 cts. per ounce less than 25 years ago. Seven of our biggest silver mines, enumerated below, which are producing in 1916 nearly 14% of the world's entire silver output from all sources, produce over 25,000,000 ozs. yearly at an average cost of 22½ cts. per ounce. The average cost of all silver shipped by shipping silver mines and silver-lead mines (exclusive of silver recovered in copper refining) is between 30 cts. and 40 cts. per ounce, with the probabilities nearer the lower figure. In 1893, the late R. P. Rothwell,

estimated 77½ cts. per ounce as the average cost of producing silver in the United States that year. In the 90s, only a few of the richest mines could show costs as low as 50 cts. per ounce. The bonanza Ontario silver mine spent 54 cts. per ounce on the 19,766,772 ozs. produced in 15 years from 1877 to 1891. It cost the Alice, at Butte, Mont., 74 cts. per ounce on the 8,721,597 ozs. produced in 11½ years from 1880 to 1891. Both were big dividend payers.

Silver at 60 cts. per ounce today is really equivalent to a price of over \$1 per ounce in the 90s, considering the lower cost of production now, thanks to lower cost of mining, treatment, and freight, and better recoveries from the ores.

The following summary shows the yearly production of seven of our biggest silver mines, the costs per ounce, together with the number of ounces of silver output yearly per share of issued stock of the respective companies.

	Yearly production ozs.	Ounces per share of stock.	Costs per oz.
N. Y. & Honduras	1,800,000	9.00	29½c
Kerr Lake	2,740,000	4.57	21
Nipissing	3,650,000	3.04	20¼
Tonopah Belmont	2,960,000	1.97	18¾
Tonopah Ex.	2,040,000	1.60	22½
Tonopah Mining	1,500,000	1.50	27½
Real del Monte	9,000,000	22½
	25,690,000		22½c

Aluminum from Clay.—A process of obtaining aluminum from clay has been patented (U. S. 1,160,431) by Grenville Mellen, of East Orange, N. J. The clay or kaolin is fused with sodium sulphate and sulphuric acid, or with its equivalent of sodium bisulphate in proportion to form aluminum sulphate and free silica. After the reaction is completed the mass is cooled and dissolved in hot water or in a hot dilute solution of sodium sulphate containing a small quantity of aluminum salts from a prior reaction. The hot necessary. A concentrated solution of sodium fluoride solution thus obtained is filtered and concentrated if is added, precipitating aluminum fluoride, which is separated by filtration. This is fused with sodium chloride and electrolyzed, producing aluminum. The sodium sulphate filtrate is concentrated to crystallize the contained salt, which is used again. By-products are pure silica, chlorine and sodium sulphate and the process is cyclic.

Further Heavy Increases in the Zinc Smelter Capacity of the United States

The large and general increase in zinc smelter capacity during the first half of the year is apparent from comparing the table published in our Jan. 1 issue, which was checked in every detail by the companies interested, with that shown on the following page for Aug. 1.

In Illinois 512 retorts were added by the Collinsville Zinc Smelter Co., Collinsville; 2400 are under construction at East St. Louis by the Granby Mining & Smelter Co.; an increase of 134 has been made by the Missouri Zinc Co., Beckemeyer; the National Zinc Co. has added 640 at Springfield, and a gain of 1360 is shown by the Robert Lanyon Zinc & Acid Co., Hillsboro.

Kansas smelters registered an increase of 640 re-

torts by the Owen Zinc Co., Caney, whose plant is under lease; 400 by the Chianute Spelter Co., Chianute; 348 by the Joplin Ore & Spelter Co. at Pittsburg, and 448 by the Weir City Smelting Co., Weir City.

In Oklahoma there was an increase of 1520 retorts for the Tulsa Spelter Co., Tulsa, now owned by the United States Zinc Co., and 1200 for the Henryetta Spelter Co., Henryetta.

The New Jersey Zinc Co. of Pennsylvania now has in operation 6960 retorts at Palmerton, an increase of 234 over previous figures; while West Virginia shows a gain of 1824 for the Clarksburg Zinc Co., Clarksburg, which is doubling former capacity, and 592 for the Grasselli Chemical Co. at Meadowbrook.

Half-Year in the Joplin Lead-Zinc District

By BURT W. LYON.*

The production of ore in the Joplin district during the first 6 months of the current year amounted to 381,117,464 lbs. of zinc (including calamine) which sold for \$17,981,313, and 55,994,072 lbs. of lead which sold for \$2,493,728. During the corresponding period of 1915 production of zinc (including calamine) was 298,390,830 lbs. which sold for \$10,202,810, while the lead output amounted to 42,763,900 lbs., which sold for \$1,010,144; thus showing the total value of both ores produced during the past 6 months to be \$20,475,041 as compared with a total value of \$11,203,954 during the corresponding period of last year.

The year opened with top-grade zinc ore selling at \$110 per ton, from which it gradually advanced to \$120, then receded to \$118 during January. February saw the price advance to as high as \$130 and then ease off to \$120, while March showed a wider range of fluctuation from \$120 down to \$95. During April the market stiffened and top grades sold from \$100 up to \$125, then back to \$115. In May the price went off from \$115 at the beginning of the month to \$95 at the close of the month, while June showed the smallest change of any month, with the market declining from \$95 to \$85.

It is believed that the price has about reached bottom as indicated by a strengthening spelter market in London and the fact that some large contracts now being placed in this country will have to be covered by ore supplies in the immediate future.

Owing to the large increase in the number of munition plants in England, France, Russia and Italy during the past few months it is hardly probable that American manufacturers of war supplies will be as heavy buyers of spelter in the future as they have been in the past, although we see no reason why there should be any appreciable decline from the other side in the demand for raw materials, such as steel, copper and spelter, for while a prolongation of the war may cause the erection of additional smelting capacity in Europe, time is required to build smelters and the availability of Australian ores to supply them cannot be regarded as affecting the demand for American spelter for many months to come. Even though the warring nations are now able to make more of their munitions much of the metal-used must still come from America.

Furthermore, it is a well-known fact that there is an enormous arrested demand for spelter both in this country and abroad for use in the various commercial industries, which the abnormally high prices of the past year have practically eliminated from the market, and with spelter even as low as 10 cts. many of these industries are able to come into the market for their supplies. It is hardly to be expected that spelter will again attain the dizzy heights to which it soared during the recent periods of extreme scarcity, but if a price level of from 10 to 12 cts. can be maintained, it insures a price of from \$80 to \$100 per ton for the high-grade ores of this district, and mines that cannot be profitably operated on such a market should not be operated at all.

During the recent era of high-ore prices a number of thin sheet ground mines have been opened up in this district whose operation could not be undertaken under normal conditions, and such properties are not only a poor investment for their owners, but are a constant menace to the stability of prices, for the reason that while they can not produce ore at a profit under normal conditions what they do produce tends to swell the total output to a point where the stability of prices is continually menaced.

A number of such properties are under the ownership and management of men having no previous practical experience in zinc mining, who have been induced to enter the industry in anticipation of fabulous profits held out by professional promoters having still less knowledge of the essentials to successful mining. Experienced operators are not alarmed at the recent decline in the price of ore, which has its compensation in reduced pay rolls and other operating charges, and with a decline in the price of explosives and other mining supplies which it is believed must soon occur, many operators in this district are of the opinion that net mining profits with ore selling at from \$75 to \$90 per ton will be practically as large as when it was selling at from \$100 to \$125 per ton.

There has been considerable talk of a strike among the miners because of the recent cut in wages from the scale paid when ore was selling above \$100 per ton, but thus far the hoisting engineers are the only ones who have put their threat into execution, and while their strike has reduced the output at some mines it is now felt that their attempt to maintain a

GROUP OF MINES AND MILLS IN THE PROSPERITY CAMP, MISSOURI.

A LEASE ON THE MEXICAN-JOPLIN LAND, MISSOURI.

high wage scale in the face of lower prices will prove abortive.

For the first time in the history of this district, which to date has produced over \$350,000,000 worth of ore, it now looks as if the mine operators and land owners would get together in a sound and efficient working organization having for its principal object the permanent establishment of a proper relation between the price of ore and spelter; which will result in the stabilizing of both the mining and smelting industries. To achieve this purpose it has been proposed that the sore heads with a chronic grievance be eliminated from such organization and its affairs be placed in the hands of the more substantial and conservative element among the mine operators of this district, to the end that friendly conferences with the smelting people for the discussion of mutual interests shall take the place of threats or cajolery.

Probably no mining district in the world has been so grossly misrepresented, both favorably and unfavorably, as the Joplin district. The comparatively small amount of capital necessary to prospect, develop and operate mines in this field has resulted in its periodical invasion by a class of cheap or unscrupulous promoters every time the price of ore has reached unusually high levels. With a nauseating mass of trashy tommy-rot these people have depicted the Joplin district as a veritable Golconda, where it was only necessary to put in dollars to take down hundreds; and after the unfortunate suckers have realized their inevitable loss they in turn damn the district as the most unreliable and unprofitable mining camp in the world. Both statements are equally untrue.

Enormous profits have been made here during the

past year or two and very large profits have been made consistently during the past 30 or 40 years, but only by people who have been careful in the selection of their investments, and who have managed their properties in a practical business-like manner after acquiring them. Very naturally there have been some losses by inexperienced operators who knew nothing of the mining business and who were too egotistical to learn, while those who have bought stocks in mining companies that were capitalized at eight or ten times the value of the property owned experienced a like result. But some people never seem to learn that even a gold dollar is not worth a pound sterling.

At this writing it appears quite certain that the present year's output of this district will easily exceed \$30,000,000 in value, but the one thing that is assured beyond question is the fact that its activities will continue and its profits roll up year after year regardless of either the ultra optimist or the disappointed sucker who likes to think of himself as an investor.

Gasoline from Shale.—According to the U. S. Geological Survey estimates there is sufficient shale in Colorado in beds 3 ft. or more thick, to yield 20,000,000,000 bbls. of crude oil from which at least 2,000,000,000 bbls. of gasoline may be extracted by ordinary refining processes. The area that has been studied by the Survey comprises northwestern Colorado, northeastern Utah and southwestern Wyoming. The shale found there contains materials which, when heated, may be converted into crude oil, gas and ammonia. Sooner or later this great source of supply will be utilized to supplement the decreasing production from the regular oil fields.

Zinc and Lead Districts of Wisconsin

By J. H. LEWIS.

As a result of abnormal conditions prevailing the entire year 1915 in the zinc-lead markets of the world which carried over at the beginning of 1916 much was expected in the way of production, mine development and equipment and additional prospect work on lands acquired under lease and as yet unexplored.

A careful tabulation of ore recoveries from all active mines in the field the first half of 1916 shows substantial gains until well along toward June when rapidly slumping prices influenced output and a consequent curtailment in ore production. The total recovery of zinc concentrates from mines for this period aggregated 201,862,000 lbs. The U. S. Geological Survey Press Bulletin, No. 273, published May, 1916, and showing in detail the yield for the zinc and lead districts of Wisconsin for 1915 gives this region credit for a total output for last year of 141,575 tons. Comparison on the rate of production shown for the first six months of this year if maintained would give the field a gain approximately for the current year of 60,000 tons. This gain will not be fully realized as low-grade ores, for which this field is particularly noted, were in poor demand as June drew to a close, and a conservative summarizing of ore held in reserve as practically unsaleable showed nearly 8000 tons being carried over. The base price of zinc ore had receded from \$110 per ton at the beginning of the year, to an average of about \$70 for 60% zinc content, for standard and top grade zinc ore, down to \$60 for base for ores running as low as 50% zinc content. Below this value sharp discrimination was evident so that low-grade producers were left floundering in a rather turbulent sea without a near hope of rescue. The situation revived the condition of zinc ore producers about a year before when high-grade ore was in demand, and refining of ore at local magnetic separating plants became imperative. This situation was being met heroically as the first half of the year was being concluded.

Net deliveries of zinc ore from separating plants to smelter and from mines to smelter direct for the first 6 months of 1916 ran higher than for the same period of 1915, aggregating 120,000,000 lbs. This improved showing was made possible by the introduction of several new separating plants early in the year, and the enlargement and improvement of plants which have been operating in this field regularly for several years. The New Jersey Zinc Co. put in a new plant of

the McDougal type at Mineral Point. Another new plant constructed for the Wisconsin Zinc Co. at New Diggings the latter part of 1915, at a cost of \$100,000, was placed in commission during March on regular three shifts. The Galena Refining Co. completed a new ore refinery at Galena, set in operation early in the year. At Cuba the National Zinc Ore Separating Co. enlarged its plant to 150 tons of ore daily, and was one of the heaviest shippers of high-grade ore in the field. The Linden Zinc Co., Benton Roaster Co., Enterprise Roasters and Joplin Works at Galena, handled much low-grade ore, and figured weekly in the reports showing shipments of high-grade ore out of the field to smelters.

Mine development prosecuted vigorously during 1915 was brought to a successful conclusion early this year and equipment provided, many fairly substantial producers being annexed to the list of regular producers and shippers. Plants were finished and put into operation as follows: Linden district—Stoner Bros.' Gilman mine for Linden-Milwaukee Development Co., Optimo No. 3 for Frontier Mining Co. Platteville district—Block-House mine, Kistler-Stephens Co., Mann & Harding Mining Co. Cuba district—Anthony mine for Standard Metals Co., Chicago. Benton district—Hird mine for Frontier Mining Co., Longhenry Mining Co., Blackstone mine for Vinegar Hill Co. Hazel Green district—McMillan Zinc Co., Monmouth Zinc Mining Co. Shullsburg district—Little Giant Mining Co. Galena district—Graham mine for Vinegar Hill Co., Birkbeck mine for the Wisconsin Zinc Co.

At the end of June a considerable building program was being followed at all points in the field. In the Highland district one new plant for the Saxe-Lampe Mining Co., another for the New Jersey Zinc Co. on new discoveries known as the Kennedy-Eberle mine; in the Linden district for the Mineral Point Development Co. on the Wickes lease; Mifflin district for the M. & A. Mining Co. on the Big Tom lease; for the Vinegar Hill Co. on the Yewdall lease, tapping extensions of the Rundell range; Platteville district for the Bell Mining Co. on the Graham-Stephens mine; Cuba district for the Standard Metals Co., on the Gritty-Six property; Benton district on the Acker mine, for the Acker Mining Co. of Pittsburgh; Hoffman Mining Co. and Sally Mining Co. at New Diggings, had mills completed and in running order, but

PLANT AT THE BLACK JACK MINE, WISCONSIN.

FIELD MINING CO.'S PROPERTY, WISCONSIN.

no shipments of ore had been reported; in the New Diggings district mills were building for the Wisconsin Zinc Co. on the Longhorn lease, and on the Chas. A. Thompson lease; in the Shullsburg district, the Oliver Mining Co. had zinc mill well along toward completion with roasting and separating plant, and a big new boarding house. In the Galena district a new company had a plant completed and in operation on the Little Corporal mine; the Cleveland Mining Co. had rebuilt a mill on the old Dinsdale mine which was producing, and had already made one or two shipments, and several old plants had been remodeled and were in shape to resume operations.

The drilling program on lands newly acquired for zinc mining purposes reached high tide in the field during the month of June, and rich discoveries in virgin soil were of almost daily occurrence. A fair criterion of the volume of work that was being followed in this branch alone may be gained from the statement that the Wisconsin Zinc Co. and the Vinegar

Hill Zinc Co. had between them alone going night and day 35 drillings machines in the Benton, Hazel Green, Shullsburg and New Diggings districts. Scores of independent operators were engaged with one or two machines, many with excellent results. All large operating companies were similarly engaged, though not quite so extensively as shown for the two companies herewith specifically mentioned. Leasing, which it seemed had been brought to the last stage of intensity at the close of 1915, continued wherever lands were found available for mining purposes, and where drill rigs could be obtained to perform this class of mine development. By the end of June this year there was scarcely a foot of land to be found south of the Platteville district that had been overlooked.

In the New Diggins district progress was recorded in the completion of a macadam road from mines operating in this camp to the main line of the Northwestern railway. The success of this enterprise immediately led to the installation of auto trucks for

SURFACE PLANT OF PITTSBURGH MINE, WISCONSIN.

THE WINSKILL MINE AND PLANT, WISCONSIN.

transportation purposes with a degree of success that will spread to all outlying producers.

In the matter of lead ore production, a substantial gain was shown over the corresponding period of 1915. The high prices paid at the beginning of the year stimulated production, many miners breaking away from pay rolls to clean up on shallow diggings long abandoned.

Shipments aggregated 2115 tons, as against 3200 tons for the entire year 1915. Lowering prices in sympathy with the declines recorded in the zinc markets encouraged many operators to hold over, and 1000 tons were held in bin the last day of June.

Shipments of pyrites for the first 6 months of 1916 amounted to 30,000,000 lbs. Millions of pounds of pyrites were held by all the zinc ore refiners of the field at the end of June for which a market had been denied for 2 months. Pyrites secured as fines at magnetic separating zinc ore plants are held as by-product and usually sold off at \$3.75 to \$4 per ton. No market was available at all after May 1, and one of the leading zinc ore refiners of the field protected by a contract, and the only shipper in the field, explained the situation as due to the increased acid making capacity in the United States, but more to a demand for high-priced spot acid making it profitable to draw on the

sulphur beds of the state of Louisiana and pyrites conveying high-acid values. It is more than probable that this situation will carry through the latter half of the current year.

Carbonate zinc ore producers chiefly in the northern camps of the Wisconsin field found their product a drug on their hands, with now and then sporadic offers from outside buying interests. The New Jersey Zinc Co., the acknowledged outlet for these ores in this field, offered no market and contented itself with importations from Canada and Mexico to supply its needs. This resulted in a much lowered output the yield for 1915 totaling 2579 tons. This year the total will be under this figure.

Process of Briquetting Zinc Ores and Waste Products.—The preparation of finely divided zinc ores, zinc dust, ash, trimmings and other forms of waste material containing zinc, for treatment in electric or retort furnaces, is patented by Otto Kippe, of Osnabrück, Germany. (U. S. patent 1,168,401.) The materials mentioned are briquetted with from $\frac{1}{4}$ to 2% of a soluble salt, such as the chloride or sulphate of magnesium, calcium, iron or zinc. The briquets thus formed are coherent and hard, and are ready for smelting in a short time.

PLANT AT THE BULL MOOSE MINE, WISCONSIN.

Six Months' Tungsten Production

The tungsten production of the United States during the first 6 months of 1916 exceeded the production of this or any other country in any previous 12 months. Prices were even more phenomenal than production and reached more than 10 times their ordinary level. The output was equivalent to about 3290 short tons of concentrates carrying 60% WO_3 , valued at \$9,113,000, according to an estimate made by Frank L. Hess. Statistics are valuable only so far as their accuracy is known, and this estimate is believed to be correct within 10% and to be under rather than over the true figures.

These figures are no less noteworthy when it is known that in 1915 much the larger part of the production was in the second half of the year, so that the

production. The quantities and values were approximately as follows: Ferberite, 1495 tons, \$3,590,000; scheelite, 1404 tons, \$4,322,000; wolframite, 201 tons, \$613,000; and hubnerite, 185 tons, \$587,000.

In most countries the prevailing mineral is wolframite, and no other country approaches the United States in the quantity of ferberite or scheelite produced. The scheelite comes mostly from Atolia, Cal., but significant quantities are mined in Nevada, Arizona, Idaho and Connecticut.

The tremendous increase of prices caused by the need for "high speed" tools to cut war steel ordered by the governments of Europe of course caused the great increase in production. Prices at the beginning of the year were irregular and depended on the buy-

PRIMOS MILL, COLORADO.

total domestic output for the 12 months ending June 30, 1916, probably amounted to about 5000 tons.

Colorado has regained its lead in the production of tungsten ores and, between Jan. 1 and June 30, marketed 1505 tons, valued at \$3,638,000, of which the Boulder field furnished 1494 tons. California sold 984 tons, valued at \$3,005,000. The reason for the higher value of the California ore was that it was nearly all sold as high-grade concentrates, but a large part of the Colorado ore sold was of low percentage and had to be milled and concentrated, with consequent expense and loss.

From Nevada, 461 tons, valued at \$1,432,000, and from Arizona 175 tons, worth \$565,000, are estimated to have been shipped. Smaller quantities were mined in Alaska, Connecticut, Idaho, Missouri, New Mexico, South Dakota, Utah and Washington.

Not only were the output and prices unique, but the ratio of the several tungsten minerals produced was different from that of other countries of large

er's need of the ore and probably on his fear of the possibility of not being able to get it when he might need it even more. Ores carrying 60% tungsten trioxide brought at that time as much as \$66 a unit, but by the last of March some ferberite sold for \$93.50 a unit at the mills, and even higher prices were quoted in the newspapers, though they could not be confirmed. The prices of the same ore in the New York market would naturally be somewhat higher. Under the stimulus of these high prices production, not only in this country but in the world at large, has been at the highest point ever known. At first the sudden demand created by the orders for war steel were far ahead of the instant productive power of the country. The rapid increase in prices, starting last fall at a time when tungsten mining was at a low ebb and culminating in the undreamed maximum mentioned, caused prospecting and consequent discoveries of new deposits, increase of development of known deposits, the operating at high tension of old mills, and the hasty build-

ing of new mills. As a result, the production increased faster than the consumption and soon overran the demand that would absorb the output at the extremely high prices prevailing, so that a drop in prices was inevitable. June closed with the price around \$25 a unit, which was still much higher than any price known before this year. The highest price previously reported was \$15 a unit, paid in 1907. The normal price has been \$6 to \$7.

During the 6 months under consideration 40 mills of various types and sizes were in operation part or all of the time on tungsten ores, and at the end of June, 14 were under construction.

In the tungsten mining camps the excitement that followed the increase of prices was similar to that caused by important gold discoveries. Nederland, Colo., a little village of two or three dozen homes, suddenly became a town of 3000 or more inhabitants. East of Nederland two settlements, each containing several hundred people, sprang into existence. Atolia, Cal., a camp of 60 or 80 people, grew to more than a thousand.

In the Boulder region, Colo., 10 mills, 6 of which

CONSOLIDATED TUNGSTEN CO.'S MILL, NEVADA.

were new, were in operation. Besides these, at the end of June five old mills were being overhauled to work on tungsten ores and three new ones were under construction. One was in course of erection on the Copeland property, on South Boulder creek, to work ores that have heretofore given much trouble owing to the fineness of the particles of ferberite, which are spread through "horn rock." Fifteen jigs are reported to have been operating on old tailings piles and on placers. From those workings on tailings, the concentrates were sent to Wilfley tables. All mills and jigs were operated by electric power, and so great was the demand for motors that the stocks in Denver were exhausted.

In Arizona four mills were erected at Dragoon, three at Arivaca and one at Yucca. In California two mills were reported under construction near Goffs and one near Nipton. At Atolia the mill of the Atolia Mining Co. was burned but was rebuilt and enlarged. A smaller mill was operated at Johannesburg, and many kinds of machines were used to extract scheelite from the desert debris between Randsbury and Atolia.

In Nevada a mill was constructed and operated near Toy, Humboldt county, and four or more mills

were constructed in the Snake range, in which tungsten deposits were found through a length of 50 or more miles. The United States Tungsten Corporation operated the mill built a number of years ago by former owners of the property at Tungsten, 12 miles south of Osceola, and a small mill was operated on the east side of the range. Most of the deposits of the Snake range are said to be of low grade. A mill was also operated at Round Mountain.

Tungsten mining was started as a new industry at Silvermine, Madison county, Mo., and a small quantity of scheelite was mined at Long Hill, 8 miles north of Trumbull, Conn. The mill on the Long-Hill property was burned and operations ceased for a time. In Washington a mill was under construction on Tungsten mountain, 35 miles northwest of Oroville.

One of the most interesting developments of the year was the beginning of production of scheelite from contact-metamorphic deposits. Two deposits of this sort near Toy (Browns), Nev., were exploited, and near Bishop, Cal., mills of 80 and 100 tons were erected on similar deposits. Other contact deposits were located a few miles south of Bishop. It is thought by the Bishop mill owners that their claims can be worked profitably under such prices as were paid before the war. Tungsten minerals added largely to the receipts of gold mines at Lead, S. Dak., and White Oaks, New Mexico.

The consumption of tungsten in the United States was even greater than was indicated by the ores produced, for all parts of the world free from the control of the warring European nations were drawn on for supplies, and during the first 5 months of the year 1520 tons of tungsten ore, valued at \$3,449,311, were imported. The June imports were probably equal to the average of the five preceding months, making the total for the half year 1824 tons, valued at \$4,139,000. Some of the ore imported is known to have been of low grade, but a considerable quantity carried more than 60% tungsten trioxide, and probably the average was not far from 60% WO_3 . Most of the ore came from South America—Peru, Bolivia, Argentina and a little from Brazil—but some ore came from Japan and Mexico. Some of that imported, like a little of the American ore, contained phosphorus, arsenic, copper and other harmful impurities, but during the height of the demand even this ore was readily bought. By June buyers became more careful and it was not so easy to sell bad ore.

Ten tons of tungsten metal and ferrotungsten, valued at \$36,885, were recorded as imported. The exports for the first 5 months of the year amounted to 4906 lbs., valued at \$10,571.

If the American production and imports are added the consumption seems to have amounted, roughly, to 5100 tons of 60% concentrates, valued at \$13,278,000. On the supposition that 20% of the metal was lost in various operations, it seems probable that between 11,000 and 12,000 tons of new high-speed steels were made during the period, in addition to the steel made from tungsten saved from scrap and scale.

Larger Imports of Manganese Ore.—Imports of manganese ore into the United States in April were 48,413 gross tons, the largest this year. This brings the average to May 1, 1916, up to 24,989 tons per month, which compares with 26,731 tons per month in 1915 and 28,757 tons per month in 1913. For the 10 months to May 1, 1916, the total imports have been 355,795 tons, against 159,203 tons and 242,748 tons for the same periods in 1915 and 1914, respectively.

A Half Year With Makers of Mining Machinery

The past 6 months has witnessed great activity among the manufacturers of mining and metallurgical machinery as a result of the unusual prosperity of the mines and works. It is the general opinion of these manufacturers that the outlook for the immediate future is excellent and that continued high prices for the metals will result in record production, and a resultant demand for additional equipment.

Conditions governing the machinery manufacturing end of the mining industry during the past 6 months are voiced by some of the leading firms of the United States as follows:

Worthington Pump & Machinery Corporation.

Although the Power & Machinery plant of the Worthington Pump & Machinery Corporation has experienced the same difficulty in obtaining raw material as other manufacturers, we have been able to keep our works operating at a capacity on our regular line of material, owing to the fact that we have not undertaken any munition work. A great many inquiries, resulting in orders for ore reduction materials, are coming in during this time, particularly copper converters. We have made several of these machines for Spain, South America and the United States, and of particular note, two converters of the Pierce-Smith type, 30x13-ft. size, from which even better results are expected than from the use of the 20-ft. Great Falls type. In connection with crushing machinery, there has been the usual demand for gyratory, and an exceptional demand for the large sizes of jaws, up to 84x6-ins. We have sold more than a dozen of the latter size, for use both in this and foreign countries. Both rolls and tube mills remain popular, and there seems to be a tendency on the part of the buyers to desire the larger and heavier types of machines, of which there is no doubt of the efficiency, although there has been some hesitancy in the past in undertaking the installation of the same when the metal markets were less favorable. Tube mills seem to tend to larger diameter and shorter length, and the large diameter, short length ball mill is also popular at the present time. We are making a number of these machines both for fine grinding in connection with flotation, and also as preliminary grinders to pebble mills in connection with cyaniding.

B. L. KNOWLES,
Publicity Manager.

Wedge Mechanical Furnace Co.

As you know, it has been our policy not to publish any articles on the work we have done or may be doing, preferring that any economies or improvements in the recovery of metal values which may have been secured through our efforts in any manner, be given publicity by users of the equipment or by articles written by engineers or metallurgists. However, we are pleased to advise you that we have enjoyed prosperity with the metal industry, due to the large quantity of new equipment which has been required by the smelters, to enable them to increase their output, and at the same time place them in a position to operate economically for future production.

LESLIE H. WEBB,
Secretary.

Hardinge Conical Mill Co.

Although we have hundreds of mills in commission in plants having capacities varying from 10 to 15,000 tons per day, none bear the unique importance of absolute advancement as does the recent installation of 8-ft. Hardinge ball mills in the great Dome gold mines of Canada, where eighty

1250-lb. stamps have been dropping for 3 years, some of which have already been scrapped and the balance will soon follow. The Dome Co. is controlled by its president, Capt. J. R. DeLamar, of international mining fame. Its manager, C. D. Kaeding, was formerly connected with large Goldfield, Nev., mining interests where stamps were the fashion. The management, influenced by the claims made for ball mills of different designs, started investigations of the work performed by ball mills at the Inspiration plant and other points in the United States. The result of the investigation was an order for two 8-ft. by 30-in. Hardinge ball mills to perform the work previously done by the stamps under the following guarantee by us: (a) That each mill should have a capacity of not less than 350 tons per day (in closed circuit) to a finer product than was being obtained from the stamps, which were equipped with $\frac{3}{8}$ -in. screens, and total metal consumption would not exceed $\frac{3}{4}$ lb. per ton of ore. (b) That the power should not exceed 125 hp. per mill when operating with a full charge of ore and balls, the latter being approximately 30,000 lbs. The result of the operation of the first of these mills, under the conditions above mentioned, on a test run of 50,000 tons, is: (a) The capacity of the mill under normal operation (without the aid of the closed circuit) is 600 net tons per day to a much finer product than is being obtained by the stamps, and metal consumption is less than $\frac{1}{2}$ lb. per ton of ore. (b) The actual net horse power required is 113, and 10 stamps have been removed for the placement of the second Hardinge mill now being installed. This 100-ton space is now converted into 600 tons. Taking into account the capacity, fineness of product, together with the lesser horsepower required, we are of the opinion that the mills are doing nearly 100% better than our guarantee.

H. W. HARDINGE,
President.

Traylor Engineering & Mfg. Co.

The past year has been the most prosperous in the history of the Traylor Engineering & Mfg. Co., of Allentown, Pa. Having a location second to none for the manufacture of mining and smelting equipment, and in fact all kinds of heavy machinery, they have ever been ready to introduce new machines that would tend to make the life of the mill and smelter superintendents less burdensome, as well as to increase the recovery of values from the ore and reduce the cost of treatment. During the half year just ended there have been more Traylor water jackets installed than ever before; more than 2,000,000 lbs. of plate steel has gone into their jackets, and when you consider that the first of these jackets with welded tuyeres and corners were not made until the fall of 1907, it speaks volumes for their design and construction. There is not a big smelting company in the world that does not use these jackets. The Traylor crushing rolls, with the automatic lateral and adjustment, is another evidence of the progressiveness of this company. At the present time they have on order 24 sets of these rolls, ranging in size from 30 by 14-in. to 54 by 24-in. All of these rolls are equipped with this automatic lateral shifting device. Among the other specialties made by the company are the Bryant-Wethy safety crossheads and skips. This device complies with all of the safety-first laws of the mining states and the proposed National Safety-First Law as applied to mines. This device was originally developed in the Montana copper district, but has since become a very general part of the first-class mine's equipment. The general prosperity of the company is evidenced by the fact that at the present time it is adding to the already well-equipped plant a new machine shop, 100 ft. wide by 600 ft. long, which will contain equipment consisting of the very latest design, all electrically driven. In addition to this new machine shop it has already added 150 ft. to the plate shop, and will erect this fall a new 4-story warehouse and administration building. The plan adopted of carrying a stock will undoubtedly be greatly appreciated by the mining and metallurgical people,

as it often means a great many thousand dollars to them to be able to get equipment without waiting for the same to be manufactured. The company extends a cordial invitation to all of their customers and friends to visit their plant at Allentown, Pa., when in the east. Allentown is easily accessible from New York by the Lehigh Valley or Central Railroad of New Jersey or from Philadelphia by the Philadelphia & Reading or the electric trolley lines.

LEWIS A. RICE,
Sales Engineer.

R. & J. Dick, Limited.

We can safely say that our business during the first half of the current year has been the largest for a similar period since the establishment of our plant in Passaic for the manufacture of "Dickbelt," previously marketed through our home factory at Glasgow, where Balata belting was originated and sold to the world for over 30 years. In addition to branches already established we opened a new office in Seattle in January to care for the increasing demands of the Pacific coast and the great northwest. Despite the greatly increased cost of all raw materials we have endeavored to protect our patrons by maintaining old selling prices depending upon the increased volume of business to see us through. Our policy has borne fruit in this respect as evidenced by the fact that we have been compelled to operate our plant by night as well as by day to keep up to our reputation for quick service. We were fortunate in being able to overcome all labor difficulties which threatened us as well as all other manufacturers. Through a well-organized system of distributors we are in a position to serve every section of the United States in addition to which we maintain a force of direct factory representatives so well located that we are in quick touch with all points of the country. We are hopeful of a continuance of this prosperous condition, not only for ourselves, but for the other manufacturers of the country as well.

J. F. LINN,
Manager.

General Naval Stores Co.

Progress in the oil flotation field has been of a kind most welcome to producers of flotation oils. A year ago inquiries ranged from green soap to fusel oil, and included many materials entirely impractical from the standpoint of price or available supply. Today inquiries, though vastly increased in number, have sifted down to a few standard products which have proved suitable under actual mill conditions and of which the supply is sufficiently ample to permit expanded operations without undue price fluctuation. This progress is largely due to a better understanding of oils and their functions as applied to flotation. "Frothing Agents" and "Oiling Agents" were vague terms at this time last year, but today, thanks to the excellent data published by our mining papers, they are both recognized and applied. Pine tar oils and pine oils have become firmly entrenched as the cheapest and best "frothing oils" for American operations. They will doubtless continue to make up 25 to 30% of the total flotation oil consumption. Certain grades of hardwood distillates have also attracted attention as "frothers." The question of what "oiling agent" shall be used seems to hinge largely on what oil can be obtained cheapest under local conditions. Coal tar and coal tar creosotes, hardwood creosotes, petroleum oils and pine tar have each found extended use in various parts of the country. Bigger and better business sums up our activities for the first 6 months of 1916.

CHAS. A. LUNN,
Director.

The Denver Quartz Mill & Crusher Co.

Denver is always first to perceive a revival of activity in mining, because she stands in the front rank as a manufacturer of mining machinery and mining supplies. The prosperity of the mining industry is distinctly shown by a visit to the Denver plants engaged in the manufacture of all

types of mining and ore milling machinery. The business of the Denver Quartz Mill & Crusher Co., which is related directly to the ore milling industry, is splendid evidence of the activity in the production of ores, concentrates and bullion. The amount of business done by it during the last 6 months is over 400% better than that of any other similar period within 3 years. This showing reflects the prosperity of all the mining states and territories from Alaska to the southern border of the United States and South America. It tells the story of new construction in the mining districts and of the increasing capacity of plants already in existence. Our experience is matched by the other manufacturers of Denver, a city which supplies mining equipment to the entire world. I trust that the rest of the United States is as prosperous as Denver.

J. G. BARTLEY,
President.

E. H. Moyle Engineering & Equipment Co.

We have expended considerable in laying out our new lines and putting in our developing plant, so as to work on a larger scale. Since writing you last we have done considerable development on our new crusher and pulverizer, and have held several demonstrations of the machine in our new plant. All the mining men pronounce it the best crusher on the market, and predict a large future for it. I am sending you a couple of samples of the product from this crusher, one of them being a hematite quartz ore (red), which went through the machine twice. And the other sample is hard quartz ore, once through. From this you will note that we have something very good. I might state that the advent of this new crusher will mean a great change in the reduction of ores, particularly free milling. For the reason that the mill will now take the appearance of a streak up the hillside, or a steel chute leading from the mine to the tailings pile, with the machines set between, and a large amalgamating pan at the bottom or something of that kind characteristic to the ore. I am now figuring on some large orders for big machines, and anticipate closing many of them.

E. H. MOYLE,
President.

The Carbo Corporation.

As with most other concerns engaged in the steel manufacturing business, our problem during the past 6 months was not that of obtaining orders, but rather of providing sufficient raw material and securing labor. We are fortunate in that while we are specialists, manufacturing exclusively steel poles for power, telephone and telegraph lines, and steel fence supporting units, our products are required by such a large variety of industries and people that the demand is well distributed. Inquiries from mining companies were light during the early part of the year, but have increased lately. New power and telephone projects have contributed the largest share for steel poles; and the farmers for steel fence supports. New foreign business is coming without any solicitation. Our main plant has been enlarged, and we are about to erect a Canadian branch in Ontario for the handling of Canadian requirements, and also for exports to British possessions. The outlook for the future could not be any brighter.

E. J. MASEGER,
Asst. to President.

The Prest-O-Lite Co., Inc.

A very marked activity in the mining industry is being reflected in our increased business on dissolved acetylene as well as oxy-acetylene welding and cutting equipment for all kinds of construction and repair work. This process, as you know, is being used on a wide range of mining work—down in the mines for such work as making butt-welded joints in compressed air and steam pipe lines, making the joints absolutely leak-proof; welding copper bonds on mine tracks; in the machine shops for welding various broken or worn mine equipment, also for boiler repairs. Another interesting development is the employment of this process on sheet-

metal construction work, also for lead burning on acid tanks. Our business with the mines has been more than satisfactory, probably due to the fact that our equipment is especially suited for mine work. The Prest-O-Lite outfit being portable, construction or repair work can be handled right on the spot, no matter where located. Our engineering department reports that the mines are showing an increased interest in the oxy-acetylene process, hardly a day passing without we are requested to offer expert advice on some welding problem which has confronted the use of the oxy-acetylene process.

BRUCE DANIELS,
Asst. Promoter of Sales.

Standard Spiral Pipe Works.

We find conditions very greatly improved, inquiries and orders coming in from all over the United States. We have as yet no past information whereby we might gauge our inquiries, because of the fact that our pipe is a new article on the market, and the engineering and mining fraternity are just appearing to realize the fact that we have an article of merit. One noticeable feature of business which is being received lately is the fact that it comes from a wider field than we had anticipated, and our product is being found satisfactory for many uses which had not been looked for at first.

A. J. BERGER,
Vice-President.

Hyatt Roller Bearing Co.

Anti-friction bearings on mine cars were thought to be a luxury some years ago. Today everybody acknowledges the anti-friction bearing to be a necessary part of a mine car in order to obtain maximum haulage results at minimum cost. The Hyatt Roller Bearing Co. has always realized the importance of their product in connection with the mine car. Still, were we satisfied as to the importance alone, advancement would not be great. A large amount of research work must be done. We have always realized the importance of this work and during the past 6 months we have prepared to do more than ever before. Our dynamometer car, which is the only one in the mining field, is doing a marked amount of good work. The first series of results obtained with this car was published in the June, 1916, Bulletin of the American Institute of Mining Engineers. An abstract of this article appeared in the June 24th issue of the Mining & Engineering World. A new sales department to more effectively handle the increased mine car bearing business was formed in February. This department is planning well ahead for the future business that is bound to come. Sales engineers have been added to the sales force for the purpose of cultivating a more extensive acquaintance with the conditions existing in the mining districts. The sales engineers are demonstrating to mine car users the advantages that can be gained by adopting anti-friction bearings as a mine car accessory. Their work is being followed up by an extensive advertising campaign. During the past 6 months two large 9-story concrete buildings have been completed and another, which is to be 9 stories, has been started. When this new building is finished in the course of a few months, we shall have 650,000 sq. ft. of floor area devoted to the manufacture of Hyatt roller bearings.

WALTER R. BYLUND,
Publicity Bureau.

McLanahan-Stone Machine Co.

We were exceptionally busy at the beginning of the year on our single roll crushers, which have proven a remarkable success when used for crushing limestone for fluxing purposes, and for brick plants for crushing their hard shale preparatory to feeding to pans. The price of manganese having advanced at such a rapid rate has been the cause of a number of mines opening up that heretofore were not able to operate, due to the fact that their ore was not rich enough, or required too much labor to concentrate same in order to find a ready market; but they are now able to sell this material at fancy prices. For this reason we have been

busy furnishing washers, jigs and other machinery for the cleansing and concentration of this material. We have also had a number of orders for repairs from iron mines throughout the south, as most all of them are equipped with our machinery. We have been hampered considerably, due to the fact that we were not able to obtain mechanics. The prospects for business look good at the present time for at least 3 or 4 months.

WM. F. KIRK,
Manager.

Atlantic Metal Hose Co., Inc.

The metal hose industry in this country, which is yet in its infancy, has made quite a record for itself among mining, railroad, stationary engineers, etc., who are rapidly adopting it. Flexible metal hose was originated in Germany and was hardly known in this country a few years ago, and therefore quite some missionary work had to be done among the various engineers in this country, in order to convince them that a flexible medium can be had by adopting metal tubing, steel or bronze, which combines the three essentials of flexibility, durability and efficiency. This metal hose industry has since made very rapid gains, especially since Europe is at war, as many foreign countries which formerly obtained their supply from abroad are obliged to turn to this country for their supply. The factories turning out this product are taxed to their full capacity with orders for months to come. During the last few years the U. S. Navy Department has found it advisable and economical to adopt flexible metal hose for conveying steam and loading and unloading oil. The government has placed orders for thousands of feet of flexible steel and bronze hose within the last few months. Many of the leading mining and railroad companies in the country have also turned their attention to flexible metal hose, where it is now used for all purposes. The prospects for this line are very promising, as figures show that the business of this product for this year has gained by leaps and bounds, and has an increase of about 400% over last year, and it looks as though the year of 1916-17 will be a record-breaking year for this industry.

Metals Production Equipment Co.

On account of activity in the iron and steel industry and the alike metal trades, we have had a good business in metallurgical furnaces. Most of this business has been for standard furnaces with a small proportion of war order work. We have had many inquiries from the iron and steel trade for powdered coal equipment. The demand for iron castings has been large and has kept our iron foundry very busy. We have recently completed a brass rolling mill and have a number of large contracts which will keep us busy into 1917. On a whole, the past 6 months has been a period of unusual activity. Our chief difficulty has been to secure a supply of competent labor.

JAMES A. VALENTINE,
Treasurer.

Western Wheeled Scraper Co.

One of the main products of this company is dump cars. Our business during the past 6 months has been quite good, particularly in the industrial field, as many mining and industrial concerns have become alive to the advantage of the use of dump cars in handling earth, stone, ore, slag and light material with this class of equipment, so that the business in this particular field has improved considerably.

WM. D. FOULKE,
Treasurer.

The Connersville Blower Co.

The first half of this year has gone into history, and as concerns our business it has been the most remarkably active like period we have experienced. Our unfilled orders have been greater, and sales, both as to the total and individual size, larger. The European war stimulated greatly

the building of by-product coke ovens and plants for developing the by-products of the process. It has been in this field that our largest volume of business during the past 6 months was secured, we having furnished nearly all of the gas pumps, exhausters, boosters, tar, liquor, and oil pumps installed, and they have been large in number. The demand for high-pressure blowers in flotation service, and vacuum pumps for cyaniding, continues to develop rapidly and is proving an important part of our business. To handle the situation we have added considerable to our plant and equipment. The future prospects are indeed bright.

J. T. SUTLIFF,
Advertising Manager.

Spray Engineering Co.

The nature of our business is such that it is, we believe, a very fair barometer of general business conditions, as we secure our orders when the large electric lighting, street railway, and industrial plants are adding to or improving their power house equipment—in other words, when general business is increasing its production and it has the money available for additions and improvements. The new business secured by this company during the past 6 months is in excess of any previous 12-month period, and we see no indication of any slowing up in the near future. The only difficulties which we are experiencing are in obtaining reasonably quick deliveries of material which we, ourselves, purchase to fulfill our contracts—another indication of general prosperity in general business.

JOHN T. CLARK,
Treasurer.

Redwood Manufacturers Co.

Our business for the first 6 months of 1916 has been more than satisfactory. It has shown a very large increase over the first 6 months of 1915, which we thought was a very good year. The main reason for this is the very decided increase in the production of copper, which necessitated the use of a large amount of additional tankage and piping. As a great part of our trade for many years has been with the mining companies, we shared in the general prosperity. Another decided feature was the inability to get steel, which led many concerns who had not heretofore used redwood pipe to install it because we could deliver immediately. If the last 6 months of 1916 are equal to the first, we would be willing to certify that this year has been a banner year.

H. B. WORDEN,
Manager Pipe, Tank & Silo Dept.

Huff Electrostatic Separator Co.

Our business has increased over 200% during the past 2 years and the only difficulty that we encounter is in not being able to get out our equipment fast enough to meet the demand. The electrostatic method has been used largely for the treatment of table middlings, etc., or as a secondary process to the general milling scheme; but during the last 2 years, we have installed plants treating crude ore, which have met with good success and we are now designing and installing a 200-ton mill for the treatment of copper ore. The results of this plant we expect will be very interesting to mill men in general, and we believe will show some very advantageous points in favor of electrostatic concentration, which heretofore have not been developed.

H. B. JOHNSON,
Manager.

Ridgeway Dynamo & Engine Co.

We are pleased to say that the last 6 months have been quite satisfactory from our standpoint, so far as the volume of new business booked is concerned, this volume having far outrun that of any previous similar period in our history. We, like all manufacturers, however, have been more or less hampered by the difficulty of securing skilled labor and the very unsettled state of the raw metal markets, which has made prices of all such material unusually high and deliveries very unsatisfactory. Our belief is that the high tide of

demand has just about reached the maximum and that we will see a more or less gradual recession during the balance of the summer and fall. We have nothing, however, to indicate that a sound, healthful condition of business may not be expected for a considerable time to come, regardless of whether the European war continues or peace is declared before the end of the year. We base this belief on the fact that domestic consumption has for years past been much lower than normal and that, as a consequence, the demand which we have been having, and probably will have for some time to come, is an accumulative one and added to it will be the increased foreign demand which has been a result of the European war. We feel that some shaking down of the abnormal conditions which have existed for the first half of the year, will probably be beneficial, rather than otherwise, and that, if manufacturers and financial interests are reasonably conservative, there is nothing in the immediate future that need be feared by business interests at this time.

H. A. OTTERSON,
Sales Manager.

The White Co.

The mining and metallurgical world has contributed much to the present strong position of the motor truck industry, being one of the heavy buyers of motor transportation equipment. The high prices that are now being paid for practically all metals has stimulated the introduction of motor trucks for speeding up the hauling of ore in sections where trucks have been used only in a limited way heretofore. In fact, many mining companies have so thoroughly established the success of motor trucks for hauling ore between the mines and the smelters or the shipping points, that they are now buying trucks in much the same manner as they buy other equipment and supplies. The economies effected by a few companies that started to use motor trucks in a small way, have resulted in orders being placed by telephone and shipments being made by express. When several mining companies near Tucson find trucks sufficiently economical to warrant them in paying \$355 in express charges from Los Angeles, merely to expedite the delivery of the trucks, the incident offers ample proof of the loss sustained by neglecting to install motor trucks. Among the companies that have recently installed motor trucks, built by the White Co., are the Boston & Montana Development Co. at their French Gulch and Elkhorn properties, Montana; the Cananea Copper Co., Cananea, Mexico; the Eastern Tulare County Magnesite Mines, California; the Bunker Hill Mines Co., Tombstone, Ariz.; the McCausland Mines, Zabriski, Ariz.; W. R. Ramsdell, Tucson, Ariz.; Vulcan Mining Co., Salido, Colo., and the O'Kelly Lease, Jean, Nev.

H. M. NEWTON,
Asst. Adv. Mgr.

Raymond Bros. Impact Pulverizer Co.

We are extremely busy at the present time, as we have just recently received an order from the Carnegie Steel Co. for 17 of our largest sized mills to pulverize coal for use in their open-hearth furnaces. Pulverized coal is fast becoming recognized as the best fuel to be used in open-hearth furnaces and many other metallurgical operations. In evidence of this, we have received many orders recently for both experimental installations and complete installations for mills for this purpose. Besides this we are keeping our shops working night and day on mills to be used in all other industries requiring finely ground materials.

W. A. KOREN,
Publicity Manager.

Colorado Iron Works Co.

The decided improvement in our business, which developed early in the present year, was due in the main to expansion by existing ore treatment plants consequent upon the high level of metal prices. Flotation has called for much new equipment and re-arrangement of old equipment in the extensive utilization of that process for the attainment of

improved recoveries. The impetus given to tungsten mining by the unexampled demand for that metal accounted for a quite measurable portion of our business, including four complete plants designed and erected, in addition to a considerable amount of equipment supplied to mills already in operation. Aside from the tungsten industry we have not felt the influence of new enterprises to anything like the extent we experienced in former years when manufacturers of mining machinery were enjoying widespread prosperity. The last 6 months, as we rate the progress made during that period, have been notable rather for the firmer position secured by pre-existing producers than for any considerable addition to the number of mills and smelters.

H. B. LOWDEN,
Secretary.

The Pennsylvania Drilling Co.

We are pleased to furnish you statement showing condition of our business for the last 6 months. During the past 6 months our business has increased rapidly; 22,500 ft. drilled, which is nearly double the corresponding 6 months of last year. Believe business is going to keep on improving, as 90% of the work we have been figuring on has been held up from week to week. These people are bound to go ahead when they find that conditions actually demand it. Activity seems to be general, as we are getting inquiries from all parts of the United States, as well as Canada and Central America.

T. B. STURGES,
General Manager.

Abbe Engineering Company.

With reference to the additional business for the past 6 months, wish to say that there has been a steady increase month after month, in the volume of business which we have been doing up to the present time, so that at the end of June, we had done business which amounted to practically 20% more than the total volume of 1915, which was a very good year for us. From the present indications there does not seem to be any signs of this condition changing.

Allis-Chalmers Mfg. Co.

The demand for mining and metallurgical machinery has been exceptionally good during the past 6 months. Owing to the high prices of all metals, especially copper and zinc, the mines producing these commodities have been pushed to the limit of their production.

Our business in mining and metallurgical machinery has been better this year than at any time in the history of this company and if it had not been for the scarcity of labor and the difficulties in obtaining raw material, especially steel plate and steel castings, our output would have been considerably larger. In many cases where improvements or additions to metallurgical plants were under consideration, they were not carried out because of the length of time manufacturers required to execute an order.

The outlook for the immediate future is equally good. As long as the war in Europe continues, the demand for all metals will be abnormal and prices will be high, and producers will continue to work under pressure to maintain a maximum rate of production.

Accepting the views of those who are in close touch with the conditions in Europe, that the war is likely to continue for at least another year, we feel that the mining industry in this country generally will continue to be prosperous and that the manufacturers of mining and metallurgical machinery incidentally will share in this prosperity to a limited extent.

H. C. HOLTHOFF,
Manager Mining Machinery Department.

American Blower Co.

A recent canvass among our own offices disclosed a very gratifying condition of business, it being almost the unanimous consensus of opinion that we may look for an indefinite period of prosperity. Despite the excessive cost of building

material and the consequent abandonment of many building projects, there is still available to us a larger volume of business than we have ever had to deal with in the past. The section of our work dealing with the particular field served by your valued paper, such as the application of fans and blowers to the ventilation of coal and metal mines, smelter fans, mechanical draft apparatus for boilers, etc., is fully as active as any other department of our business. As regards improvements relating to metallurgy and mining, will state that we have recently developed the Sirocco system of inductive extraction for exhausting corrosive fumes by induced flow, the fan in each case handling atmospheric air only.

T. CHESTER,
Chief Engineer.

El Paso Foundry & Machine Co.

As you know, our principal business was in Old Mexico, manufacturing mining machinery and furnishing supplies to a great many of the companies there; but it grew steadily worse and at last stopped, as it was impossible for people to do anything in that country, not only on account of the railroads being out of commission and partly destroyed, but the uncertainty of the government and who the ruling power would be in the district in which they were located. I have been surprised very often at the faith and persistency of many of these mining men in Mexico. This affected our business, but fortunately for us here, the copper market took on a tremendous advance a little over 6 months ago, and consequently we have been very busy so far this year and I feel that conditions warrant me in saying business will be good for the next 6 months. We have been obliged to run night and day on machinery for the mines. In regard to Mexico, we all feel that it must come to a head very soon, as it has been growing steadily worse for over 5 years. People in the southwest are very tired of the "watchful waiting" policy of our government. Also, we do not like to have these Mexicans come into the United States and kill people who had no interests in Mexico whatever. This has happened many times. As soon as Mexico does get straightened out, there must be a tremendous amount of business in this country.

W. N. SMALL,
President.

The Marion Steam Shovel Co.

Unusual activity in the mining field and in many of the other lines of business which we serve, has made 1916 an exceptional year for us. Our only complaint is that we could have done an even greater business, had we been able to secure the necessary material and labor.

F. H. KING
Sales Manager.

The Webster Mfg. Co.

We have no munition contracts, but nevertheless, have been very busy on work for domestic concerns, and have reasonable expectations that the balance of the year will find us equally busy. Of course, we have experienced considerable difficulty in securing certain raw materials, but this trouble is shared by all other manufacturers of similar equipment. It is interesting to note that the present activity in the buying of mechanical equipment follows out the rule that there is more buying when prices are higher and manufacturers busier than when a slack market renders the same equipment available at a much lower figure.

MINER RAYMOND,
Advertising Manager.

The Pelton Water Wheel Co.

Replying to your letter relative to the conditions of the industry, installations, improvements in metallurgy, mining, etc., the Pelton Water Wheel Co. has had a very satisfactory business during the past 6 months.

J. W. SWAREN,
Publicity Manager.

Who's Who in Mining.

With this issue we inaugurate the publication of a "Who's Who in Mining," presenting from time to time men foremost in building up the great American mining industry. The series could begin with a no more notable representative than Daniel Cowan Jackling, whose likeness graces the opposite page.

Probably no man connected with affairs of mining the world over has recorded greater signal triumphs in mining and metallurgy than has Mr. Jackling, particularly in the handling of low-grade properties—both gold and copper. As monuments to his wonderful executive and professional ability stand the Utah, Ray Con., Chino and Nevada Con. Copper companies and the Alaska Gold Mines, with all of which he holds managerial positions. In addition he holds important offices in banks, power companies, hotels, etc.

He was born in 1869 and graduated from the Missouri School of Mines in 1892 and his life since that time has been one of constant advancement.

Geological Survey's Mid-Year Review Shows General Prosperity.

"The accomplishment of the mining industry in the 6-month period just completed warrants the forecast that 1916 is to be a record-breaking year." With this statement the Director of the United States Geological Survey sums up his official mid-year review of the mineral industry as reported to him by the Government geologists and statisticians covering the different subjects. "Active demands and good prices have furnished the mine operators with full opportunity for success in working developed properties, and this in turn has given added incentive and available funds for exploration, prospecting, and experimentation with new processes. The mining man is having his innings."

Summarizing the special reports which are now being made public, Director Smith continues his review:

The returns for 6 months furnish a basis for the belief that 1916 will set up a new record for the soft-coal mines. Every coal-mining state is sharing in this prosperity and, of course, this demand for coal is to be traced back to the increased business of the railroads and of the steel and other large industries.

Drilling activity throughout the oil-producing

*Illustrated.

states has brought about a gratifying increase in production of crude oil that promises to make 1916 a record year for marketed petroleum. Already production and consumption are reported by the Survey's specialist as essentially in balance east of the Rocky mountains, with a tendency to lower prices.

The Portland cement industry has had a busy 6 months and the manufacturers are optimistic. It is predicted that in both production and shipments of cement this year will show a gain over last year, if indeed it does not establish a new record for cement.

Among the metals copper is continuing the steady increase in production which began early last year, and the forecast for 1916 indicates not only the largest output ever known but also the largest profits.

Shipments of iron ore from Lake Superior points for 5 months of 1916 exceeded by more than 80% those for the same months in 1915, and the indications for the year are favorable for a new high record on iron-ore production, and of pig iron as well. Higher prices with a steady demand are stimulating the mining of manganese, with the result that this year's output of ore is expected to surpass the large production of last year.

The lead and zinc mines are producing ore at a rate even exceeding that of last year and the prevailing prices have made possible the working of large quantities of low-grade ore.

Most precious-metal mines are operating at full capacity. The gold production will probably fall below the high yield of last year, but silver, the one metal last to benefit by the general domestic prosperity, is expected this year to break all previous records.

In quicksilver the outlook is for a continuance of the output of 1915, which was the largest for several years. Thus far in 1916 the average price has greatly exceeded the 1915 prices; and although the reaction in prices has come, conditions are favorable for steady and profitable operation of the quicksilver mines, some of which are newly opened.

The reports from the Survey's western offices are all optimistic. In Arizona mines and smelters are working at high pressure, and the production of metals already shows an increase that promises to make the value of the output nearly double that of last year. Arizona will maintain first place as a copper producer. New Mexico is continuing its rapid progress as a metal mining state, with increases in its output of lead, copper, zinc, gold and silver. The mines of Colorado in the 6 months just past have shown some changes in output as compared with last year; an increase of 30% in copper is indicated, together with small gains in lead and zinc, a 15% decrease in gold, and little change in silver. This output, however, represents a large gain in value of mine production. Mining has also been stimulated in Montana, and the forecast indicates an increase of 60% in the value of the mine product over that of last year. Here also record outputs may be

expected for 1916. Idaho mines are increasing their shipments in all the metals, with higher wages and larger dividends as the result of better prices.

Utah is experiencing an ore production in excess of smelter capacity. The value of the 1916 output of copper is expected to be double that of last year. Throughout Nevada the old term "boom" best expresses the present mining revival. Old mines are being reopened and regular producers are working at full capacity. The chief gains in production will be in copper, lead, and zinc. The increased activity in the mining industry of California is finding expression largely in the reopening of mines that have been long idle and the opening of new mines for chrome; tungsten, manganese, antimony, and magnesite, rail shipments of these ores to the East being made possible by prevailing high prices. Washington is another state which shows increased production, the mining industry there being in better condition than for several years past. Alaska also is benefiting by the increased activity of its mines. Copper mining is showing great advances, and the output of both copper and gold promises to exceed that of last year.

The Copper Metal Situation—End of War Will Continue Demand.

Copper has always been a subject of conflicting views owing to the active speculation that exists in the metal. The situation at present is undergoing more analyzing than when the price was around 11 cts. Here you hear of an inflated market; there it is decided that it is fundamentally strong. The absence of business is declared by some to be caused by certain copper producers maintaining prices above 25 cts. Some conservative copper factors declare that the large producers are using their abnormal profits to tide the market over the dull period, and that unless business again develops on an extensive scale, these producers will not only have lost a good part of their profits but also sacrificed an opportunity to maintain a strong market for the metal for a lengthy period. In other words, they contend that it would be far better to bring copper down to a stable basis around 20 cts. with steady buying than to maintain prices from 27 to 29 cts. until consumers can be forced to buy.

The above opinions are combated by views of producers who assert that the status of the market is as strong as could be wanted. In the first place, production over the rest of the year to the extent of about 70% is already sold. The warring powers are deferring copper buying until the results of the summer military operations can be studied so that a basis of opinion as to the war's duration can be formed. In the event that the conclusion is reached that the war will continue well into the summer of 1917, perhaps into the winter of next year, then a resumption of war material buying on a tremendous scale will be wit-

nessed. Producers of copper are banking on the war continuing into 1917. Explaining the maintenance of the present high copper prices one large producer asserted that the extensive orders now booked fully warranted the present level of values and as to there being a repetition of 1907, he scouted the idea, declaring that producers were doing all in their power to prevent a top heavy market.

New York bankers, buying for the allied European governments, have been heavy purchasers of brass goods and this is expected to result in some additional takings of raw copper against requirements.

The foreign view of the copper metal situation is contained in a recent issue of the *London Statist* which says:

The severe retrograde movement which manifested itself in metals a few weeks ago, mainly under the influence of political events, is looked upon as the natural reaction from the more hopeful feeling in connection with military and the protracted period of ridiculously inflated prices, except as regards tin. Uneasiness, all the same, has been and is still felt in this metal, where alone speculative commitments awaiting liquidation were open, since such operations in other metals have been forbidden for months past.

The conclusion is irresistible that an adjustment of refined copper prices must ensue on the part of American producers ere anything like a revival of buying can be looked for from consumers, especially in the United States, where probable needs were over-estimated and resales have been plentiful. What is now happening is precisely a reversal of the extraordinary conditions which prevailed so long as war and American demands were in the ascendant and the output inadequate. The pulse of the market can be to some extent gauged by the headlong fall in standard copper, thus forestalling successive and sharp price cuts that might ensue by first hands should anything happen to precipitate competition. Yet the value of standard copper cannot be regarded as a reliable index to the general position in the absence of a free market, or so long as dealings remain prohibited under the Defence of the Realm Act.

It is probable that American producers will make efforts to hold prices for a time, so as to prevent any serious dislocation of business in the domestic trades, where far forward requirements were covered at near the top of the huge rise. Resales of dear metal, however, may be indulged in to an extent sufficient to imperil the market. Then, again, much depends on the proportion of the unsold surplus that must accrue from the excessive output. There has been a big extension of refining capacity this year in the United States, in order to cope with the vast development of mine and smelter output; but steps may be taken to check production if unwieldy accumulations are threatened.

So long as American producers are able to realize over £100 a ton for their copper, it is hardly to be supposed, however, that any concerted action would be taken to cut down operations.

Shareholders Reap Rich Reward from Mine Investments.

Many who have made successful investments in other than mining securities express wonder at the readiness of the general public in placing their savings in mining shares. To these a study of the dividend review published elsewhere in this issue is commended, and which, by the way, is the most accurate and complete ever presented by any publication.

The mining and metallurgical industries were

found ready to meet the enormous requirements for metals by the warring nations, being in a better position than ever before to do this. At the same time these mines and works were in a better position than ever before to earn greater profits than were possible before the era of improved machinery and processes made possible the economic treatment under the supervision of advanced technical skill, of the vast low-grade deposits, particularly of the porphyries.

As a result of this great preparedness these mines and works to the number of 140 paid to fortunate shareholders during the 6 months' period no less than \$117,158,991, more than double the amount paid out during the entire year 1915. That the dividends of these companies are of regular occurrence is evidenced by the fact that since incorporation they have distributed the enormous sum of \$1,157,668,079.

Great as the profits mentioned above they represent only a part of the enormous wealth that was taken out of the mines during the half year of 1916. If it were possible to compute the enormous profits that are regularly distributed by the many private and close corporations, which are directly interested in the mineral industry, the fact would be emphasized that fabulous wealth is being created by American mines and metallurgical works. To report annually an output of minerals in excess of \$2,000,000,000 and a dividend record that will approximate \$300,000,000 in 1916 is a record to feel proud of.

Stockholders are not alone in sharing these vast profits earned by the mineral industry in 1916, for labor also was greatly benefited, mining companies having been generous in increasing wages to the extent of many millions.

Manufacturers of mining machinery, as evidenced by the testimony of the country's leading representatives, published elsewhere in this issue, have had an unusually successful half year. Then, too, there are the railroad and transportation companies which have fattened their purses as a result of increased mineral production.

In fact this country's prosperity, during the half year, should be credited largely to the great expansion in our mining and metallurgical industries.

The matter of transportation of ores from mines to railroads is an important factor to be considered in the operation of mines in out-of-the-way places not reached by railroads. It is often the cost of such transportation that determines whether or not profitable operation is possible. Where wagons hauled by horses or mules are used the weight of the load is rather limited and much time is consumed in transit. Since the introduction of the motor truck this efficient means of transportation of ores, etc., between mines, mills and railroads is steadily finding increased favor. By use of the motor truck or tractor in place of animals, haulage costs can be greatly diminished, and the haulage capacity increased.

MILL AND SURFACE PLANT OF MAGMA COPPER CO., ARIZONA.

The Half Year with United States Mines

From every metal producing state comes reports of unusual activities during the first 6 months of 1916. Copper and zinc-producing states, in particular, record a period of productiveness never before equalled. In the following, reviews by experts of the Survey conditions during the period, with approximate productions are given.

ALASKA.

The Alaska mining industry will have a very prosperous year in 1916, according to a statement by Alfred H. Brooks, covering the operations during the first 6 months of the year. Copper mining will probably show the greatest advances. About 15 Alaska copper mines are now shipping ore, and developments are being pushed on others, indicating that they may become producers before the end of the year. There is every reason to believe, therefore, that the Alaska copper output for 1916 will be greater than that for any previous year. The gold lode mines of Alaska will also make a larger production this year than last, but it is not now expected that the placer-mining industry of Alaska will show any marked increase. The shipment of antimony from Alaska is continuing, and some tungsten ores have already been shipped from the Fairbanks district.

ARIZONA.

The mines and smelters of Arizona have been working at a pressure so high in 1916 that they are probably making record productions of all metals. If they continue to work at the present rate during the year they will make an output of over 600,000,000 lbs. of copper, against about 450,000,000 in 1915, according to reports from Victor C. Heikes. A corresponding increase in the output of the precious metals and an increase in that of lead and zinc, which is probable, will, at the greatly increased prices, make the total value of the output in 1916 nearly double that of 1915, which was about

\$88,000,000. Thus Arizona not only retains first place as a copper producer, but is producing at a rate nearly double that of any other state. Aside from a general effort to take advantage of an unusually active market, several factors have aided this increase, such as the settlement of the strike at the Clifton-Morenci mines in January. The International smelter, which treats Inspiration ore, contributes the greatest part of the increase, for this plant is supplying about one-fourth of the total copper. Marked increases and improvements were made at the United Verde, Miami, Calumet and Arizona, and Old Dominion mines, and the Sasco plant in Pima county was again blown in. The railroad to Ajo was completed and work has been begun there on a 4000-ton leaching plant.

There is great activity in the production of gold, especially in Mohave county, and the high price of zinc has stimulated production at the Tennessee, Union Basin and Kingman zinc properties. The mill at the Union Basin mine was enlarged, and the work at the San Xavier mine in Pima county was resumed.

CALIFORNIA.

There has been much greater activity in the mining industry in California for the first 6 months of the year, as compared with the conditions in the first half of 1915, but it has been largely in the direction of the reopening of old properties which have been years idle. Charles G. Yale reports that the U. S. Mint at San Francisco, and local smelters and refiners are in receipt of \$366,000 less California gold, and 22,000 more ounces of silver, in the first 5 months of 1916, than in the corresponding period of 1915.

Aside from the gold, silver, copper and lead mining industries of California, there has been thus far in 1916 a heavy demand for such mineral substances as chrome, tungsten, magnesite, manganese, antimony, etc., and a great many mines of this character have been opened and are shipping. For the first time in history many of these mines are shipping crude material to the Eastern seaboard by rail, the high prices now permitting this.

There has been no noticeable increase thus far this year in the number of productive gold mines in the state. During

CHAMPION MINE, CALIFORNIA.

the first half of 1916 there has been greater gold mining activity in the Mother Lode counties of the state than has been the case for a long period. These five counties produced 61% of the annual California output of siliceous ore. The older active mines, are all doing well. In the Kennedy

at the bottom of the 3900-ft. vertical shaft they are working a large body of profitable ore, and are sinking 100 ft. more. The Argonaut, adjoining, has at a vertical depth of 3300 ft. a body of \$13 ore—very exceptional value for a Mother Lode mine. Ore yielding over \$1000 per ton is being taken

DREDGE OF THE ORO WATER, LIGHT AND POWER CO., CALIFORNIA.

NATOMA NO. 10 DREDGE, CALIFORNIA.

out of an 18-in. vein at 1600-ft. depth in the Gold Cliff, part of the property of the Utica Mining Co. in Calaveras county. In the same county the Melones is in excellent ore. Very high grade ore is being taken from the mine of the Calaveras Development Co., near Mountain ranch. The most noteworthy feature of the situation in the Mother Lode counties is that a number of the old mines, long idle, are being unwatered and reopened, this being brought about by the success of the deeper mines which have continued work. At Sutter Creek, Amador county, the old Eureka, or "Hetty Green" mine, a famous producer 30 or 40 years ago, is being reopened by a strong company, and extensive operations have been inaugurated.

The Oneida mine, closed down for years, has been put in shape, and part of the stamps are running on ore from the mine. The Poundstone mine in the same district is being unwatered. The old Wildman & Mahoney properties in which are three shafts, and very extensive workings, and which have been for years idle, are being reopened by a new company. On the Zeila mine, Jackson, some time idle, a new shaft is being sunk to facilitate working good ore opened by long drifts from the old workings. The Argonaut is building a new 40-stamp mill, and a large reservoir for storage of tailings behind a concrete dam, 400 ft. long and 40 ft. high. The Amador Star, at Plymouth (formerly the Rhetta and Bay State), has been reopened this year and a new vein of satisfactory ore found. In Calaveras county, a company has been formed to develop the Thorpe mine at Fourth Crossing, which has been idle 18 years. Several old

claims near the Melones mine have consolidated and are to be worked as one property by a new company. In Tuolumne county, the Tarantula mine, at Chinese, has been purchased by ex-Governor Gage, who will work it and the adjoining Jones group. The Rawhide and App mines, near Jamestown, formerly heavy producers, have come under new ownership and are being reopened and rehabilitated. The Patterson, near by, is also to be started up again. The Crystalline and Alabama mines, near Sonora, several years idle, are being reopened by Los Angeles men. The old Columbia, near Tuolumne City, is being reopened and the shaft sunk to 1000 ft. depth. In El Dorado county important discoveries have been made in the old Montezuma mine, near Nashville. In El Dorado district, near Placerville, the old Church-Union mine is again being developed, and the Oram, adjoining, has been started up again. After 35 years' idleness the Cedarburg mine, near Spanish Dry Diggings, is being reopened.

Deep mining outside the Mother Lode section of the state is also unusually active. In the Grass Valley district, Nevada county, both the North Star and Empire mines, the leading producers, are finding high grade ore in depth. In the Providence, of the Champion group, Nevada City, a strike of high grade ore, carrying telluride, has been made. In this section a number of small and idle mines are coming into possession of the larger companies in order to improve their position in the district. The old Murchie mine is to be unwatered and the shaft deepened. The famous old Allison Ranch mine, formerly a large producer, but idle since 1898, is being reopened by a new company. In Butte county,

DREDGE NEAR CAMANCHE, CALIF.

at Forbestown, the Gold Bank, Golden Queen, and Shakespear, formerly producers, have been sold to Salt Lake men, who will reopen them. In the southern counties of the state, notably in the desert regions of Inyo, San Bernardino, and Riverside counties, there is a distinct revival of mining activity, largely brought about through the adoption of auto trucks for delivery of ore to railroad stations for shipment to reduction works.

The gold dredging industry of the state continues in a flourishing condition. The dredges produce 86% of the placer gold of California, and 38% of the total gold yield. The larger companies have been adding new machines to their equipment, and these are invariably of great capacity, several costing over half a million dollars each. The new dredge of the Natomas Con. in the Folsom district, designed to restore ground to its natural condition after dredging, permitting its use for agriculture, has demonstrated its efficiency. Extensive areas of placer ground near Redding have been bonded and are being prospected for dredging. Over 1500 acres of dredging ground along the Trinity river from Lewistown to Poker Bar have been acquired by capitalists, and one dredge will be in operation this summer; two more next year. Dredge machinery from Ohio, for the dredge near Carrville, Trinity county, amounting to 2000 tons, is being

the channel in the extension of the famous old Bald Mountain drift mine.

Copper mining in the state has been very active in 1916, owing to the high price of the metal. The larger companies have increased miners' wages in the form of a bonus while electrolytic copper sells at 20 cts. a pound or over. A number of new copper properties have been opened in Trinity, Siskiyou, Plumas, Madera, and other Northern counties, as well as in several of the Southern counties of the state. The Engels Copper Co. in Plumas county is using the flotation process to concentrate its ore before shipment to Nevada smelters. The Calaveras Copper Co., near Copperopolis, has increased the capacity of its flotation plant. The Bunker Hill copper mine, near Auburn, Placer county, which shipped ore to Swansea, Wales, 52 years ago, and has since been idle, has been reopened this year.

COLORADO.

During the first 6 months of 1916, according to returns received by the Survey, the output indicates a 15% decrease in the yield of gold, very little change in the production of

GOLD KING MILL, COLORADO.

hauled from the railroad at Redding, 62 miles into the mountains, 300 mules being used in the hauling work. The largest dredge in the world has been completed and set at work on the Yuba river, near Hammonton. It is the fifteenth dredge of the Yuba Con. Goldfields. The Pacific Dredging Co. is building a very large dredge near Smartsville, Yuba county, on ground extending along the Yuba and Bear river, and several other dredges are planned in the district not far from the holdings of the Yuba Goldfields. The Oro Water, Light & Power Co. is arranging to construct a third dredge in the Mokelumne river near Comanche, Calaveras county, extensive quantities of pay gravel having been found outside the main property of the company. Several small dredges have been put on "outside" ground in the mountain region this year.

Hydraulic mining has not been very active outside of Trinity and Siskiyou counties, but some new mines have started up in central California. A merger of hydraulic mining interests is being made in the Slate Creek district, Sierra county, and extensive work is contemplated, under supervision of the California Debris Commission. A mammoth restraining dam is to be put across Slate creek, which will permit, when completed, hydraulic operations at Scales, Port Wine, Whiskey Diggings, Gibsonville, La Porte, and other famous old camps, long idle. A revival of drift mining along the Magalia ridge, in Butte county, has brought about numerous changes, and the reopening of old properties. The old South Fork property, on Oregon creek, Sierra county, is now continuing the 6000-ft. bedrock tunnel to try and reach

silver, a small increase for lead, an increase of 30% for copper, and a small increase for zinc. As the average prices for silver, lead, copper, and zinc are much higher than in 1915, this output represents a considerably increased gross value.

Cripple Creek annually produces 60% of the state's output of gold, but in the first 6 months of 1916 the production there fell off appreciably from that of 1915, which was \$13,681,000, the largest since 1906. The San Juan region has not maintained the output of 1915, which was \$3,850,000 in gold and 2,280,000 ozs. of silver, the production having fallen off in La Plata, Ouray and San Juan counties, although there was an increase in the production of gold and silver in San Miguel county. The idleness of the Wanakah mine and smelter and the gradual decline of the Camp Bird mine caused a decreased output of all metals in Ouray county. The measurable ore reserves of the Camp Bird mine, according to the manager's report for the first quarter of 1916, are reduced to the almost negligible quantity of about 1200 tons, and there is little prospect of developing any more of consequence in the Camp Bird vein until after the 2-mile adit, now being driven, shall have reached the vein, some 450 ft. lower than the present workings. The time required to complete the adit is estimated at 27 months. Lake county has not maintained its gold production of 1915, which was \$2,260,000, but has increased its yield of silver, lead, copper, and zinc, and the gross value of all metals produced in 1916 promises to exceed greatly the \$14,000,000 output of 1915. With the unwatering of the Penrose shaft now complete, the un-

RICO MINES CO., COLORADO.

watering of the Harvard shaft approaching completion, the unwatering of the Wolfftone commenced, and the resumption in April of the Derry dredge, an increased yield for the latter half of 1916 may be expected. Eagle county's yield of gold showed a decrease, but operations at Red Cliff and at Eagle showed an increased production of silver, lead, copper, and zinc. Summit county dredges have not yet produced the proportion they did in 1915, but increased shipments of lead

and zinc ore and concentrates have been made from Breckenridge and Montezuma. Clear Creek county showed a decrease for gold but an increase for silver, lead, and copper, and Gilpin county's yield showed an increase for copper only. Mineral county's (Creede) production showed improvement, which may be expected to continue with the higher price of silver and the maintenance of milling operations, resumed after a period of idleness.

HUDSON MILL, COLORADO.

IDAHO.

Unusual conditions in Idaho make it impossible to estimate accurately the lead output of the state, but shipments are being made at the rate of about 360,000,000 lbs. of lead a year. There will be a correspondingly large output of silver and a great increase in the total value of the state's output of metals. This statement is based on reports received by the Survey from its field office at Salt Lake City. Some of the large mines in Idaho are greatly increasing their shipments, notably the Hercules, Hecla, and Morning. The Tamarack & Custer is temporarily closed, the Marsh is not now producing, and the output of the Stewart will probably be much below that of 1915. The mines of the Coeur d'Alene region are shipping lead ore and concentrates at the rate of over 30,000 tons a month, and zinc material at the rate of over 8000 tons a month. Blaine county has added little to the lead output, Lemhi county is far below the record of former years, and the Wilbert, in Fremont county, is also producing somewhat less.

Important changes are in progress in the metallurgical

stitution, Hercules, Colonial, and Highland Surprise were lesser shippers. A mill was built for the Constitution mine on Pine creek.

Receipts of gold bullion for the half year at Boise show an increase over the same period of 1915.

MONTANA.

The unusually high prices of metals in 1916 have stimulated mining to a marked degree in Montana, especially at Butte. At the present rate of production, there will be notable increases in the output of all metals, and a marked increase in the total value of the output. According to reports received from V. C. Heikes, the output is now being made at a rate which will give a total value of about \$140,000,000 to the year's metals instead of about \$87,000,000, the value in 1915. The production of gold from precious metal bullion is showing a large increase and will be augmented by gold from a much greater output of copper ore. The production of silver will doubtless keep pace with that of copper

BUTTE & LONDON PROPERTY, MONTANA.

industry. The Hercules ore and concentrates are treated at the plant at Northport, Wash., where two lead furnaces are in operation and two more are to be built. Preparations are also being made to build a lead plant at Kellogg for treating the ore of the Bunker Hill & Sullivan mine as well as custom ore. New mills are being constructed for the Ray Jefferson, Hypotheek, and Ida Continental, and one is planned for the Tamarack & Custer. As prices have become better, wages and dividends have been greatly increased.

Though the Snowstorm mine is no longer a producer the output of copper in Idaho is progressing at a better rate than in 1915, largely on account of increased shipments from the Empire property at Mackay. Other shipments came from the National, Caledonia, and Richmond. A mill was constructed on Little North Fork for the Horst Powell property.

Shipments of crude zinc ore and concentrate indicate a good increase in the output over that of 1915. The Con. Interstate-Callahan shipped over 15,000 tons of zinc material during the first quarter of 1916, a figure that indicates a rate of more than 51,000,000 lbs. of spelter a year for that mine alone. The Success, Frisco, Greenhill, and Morning contributed considerable amounts, and the Terrible Edith, Con-

and with the increased output of zinc. The production of copper, though below the normal in January and February, has been increased toward the middle of the year by both the Anaconda and East Butte companies. This gain indicates that the output of copper for the year may be 350,000,000 lbs. against 275,000,000 lbs. in 1915. The East Butte mine was averaging 1,300,000 lbs. a month the first 5 months and the Anaconda about 26,000,000 lbs. a month, with a better rate in April and May. The latter company has been busy remodeling its big concentration plant at Anaconda and constructing a zinc plant, as well as building a new refinery at Great Falls.

An increase of about 30% in the output of zinc during the year is indicated. For the first quarter of 1916 the Butte & Superior mine produced nearly 48,000,000 lbs. of gross zinc in concentrates, or at the rate of 192,000,000 lbs. a year. The Elm Orlu mine has also increased shipments of zinc concentrates to about 5000 tons a month and may increase this rate. The lead production will probably be increased because of the great amount of concentrates derived from lead-zinc ores. High prices of metal have given better wages and unusual profits, and may result in record outputs of all metals.

RAINBOW LODGE DEVELOPMENT CO., MONTANA.

NEVADA.

Mine reports received from V. C. Heikes indicate that during the last 6 months the mining industry in Nevada has experienced one of its greatest revivals. Old mines closed down for years have resumed or are being put in shape for production, and the regular producers have increased their output to the fullest capacity. At many points the use of tractor engines, hauling on each trip as much as 30 tons of ore between mine and railroad, have helped to improve conditions, as formerly there were not teams enough for all purposes. The many milling plants of the state are reported to be in full operation, and a number have adopted the flotation process for increased saving. In the Yellow Pine district five dry mills are operated on zinc ores. Only one of the two copper smelters in Nevada was in operation.

Gold will likely show little increase. The declining production at Goldfield may be made up to some extent from the general increase in output of ores. No new gold deposits of note have been found. The placer-gold production at

Manhattan and Round Mountain is about the same, the latter making up for any decrease in the former. Silver may show a gain from increased operations made at Rochester, but the increase will probably be offset by the idleness of the mines in Churchill county. Little if any of the silver output is held in storage for higher prices compared to the quantity so held in 1915.

The production of ore containing lead has been greater than in recent years, principally from Pioche, Goodsprings, and Eureka. Ely produces most of the copper, and at the rate of production for the last 6 months will yield 92,000,000 lbs. of the metal in 1916. Copper properties in the vicinity of Luning and Yerington have been active in shipping low-grade ores to the Salt Lake smelters at the rate of about 2000 tons monthly. Deposits of zinc ore have been opened in Elko county, where about 600 tons is being produced and shipped to eastern markets every month. In Clark county, around Goodsprings, about 2800 tons of oxidized zinc ore was shipped in May and as much during the previous months. At Pioche a small output of zinc sulphides was recorded.

As the copper output has been increased more than 50%, the value of the output at present prices will be double that of the past year.

ROCHESTER MINES CO.'S MILL, NEVADA.

COUNTRY SURROUNDING ROCHESTER MINES, NEVADA.

NEW MEXICO.

The mines of New Mexico during the first 6 months of 1916 show small increases for gold and silver and appreciable increases for lead, copper, and zinc, according to Charles W. Henderson.

In the Mogollon district, Socorro county, which in 1915 produced 40% of the gold and 65% of the silver output of the state, the Fanny and the Last Chance cyanidation mills, idle in 1915, was placed in operation in April. Gold bullion and concentrates continued to be shipped from the Elizabethtown district, Colfax county, and gold bullion from the Whiteoaks district, Lincoln county. The output of silver was affected considerably by the idleness of the Cossak cyanidation mill, in the Cochiti (Bland) district, Sandoval county. Gold-copper ore continued to be shipped from the Orogrande district, Otero county. The purchase by the Phelps-Dodge Co. of a large area in the Organ Mountain district, Dona Ana county, promises a future production of all five metals. Silicious and copper ores carrying gold were shipped from the Lordsburg district in quantities that indicate an output nearly double that of 1915. The Santa Fe Gold & Copper Co.'s matting plant at San Pedro was operated continuously. The Burro Mountain Copper Co.'s flotation mill in the Burro Mountain district was placed in operation in April, 1916. The Chino Copper Co.'s mill, which in 1915 produced concentrates containing 68,293,893 lbs. of copper, yielded during the first quarter of 1916 a total of 16,267,450 lbs., the total quantity of ore treated for the 3 months being 714,400 tons, an average of 7850 tons a day, the highest average tonnage treated by the mill since it began operations. Shipments of copper from the Magdalena district increased. Lead ore was shipped from Cooks Peak and Tres Hermanas districts, Luna county; from the Central and San Simon districts, Grant county; and from the Magdalena district, Socorro county. Increased shipments of zinc carbonate and zinc sulphide concentrates were made from Magdalena, Hanover, Cooks Peak, Florida, Tres Hermanas, and Pinos Altos districts. A mill was erected in the revived Steeplecock district, Grant county, and some shipments were made.

OREGON.

No changes of moment in the mining situation in Oregon are noted by Charles G. Yale for the first 6 months of 1916. The bullion receipts of the mint and smelters at San Francisco show that the output of gold has increased \$107,000 and that of silver 14,000 ozs. in the first 5 months of 1916 over the output of the corresponding period in 1915. The increase in gold is due entirely to dredging operations. The Powder River Gold Dredging Co., which in the first half of 1915 had but one dredge operating, near Sumpter, Baker county, has been working with two dredges during the first 6 months of 1916. With the exception of three deep mines, all in Baker county, this is the largest gold-mining enterprise in Oregon.

The properties of the Cougar Mining Co., near Sumpter, have been placed under lease and bond to the United Gold Mining Co. of Spokane, Wash. In addition to the 200-ton mill, tube mills and a cyanide plant are to be installed. The Queen of Bronze copper mine, which ships its ore from Waldo by team to Grant's Pass and thence by rail to smelters at Kennett and Tacoma has been sold to men who intend to extend a railroad to Waldo. After years of idleness work has been resumed on the Iron Dyke mine at Copperfield, which is shipping ore to Colorado for reduction. The Black Eagle property, near Grant's Pass, has been sold to men who are to erect a 50-ton mill.

There is notable activity in the hydraulic mining industry of the state, particularly in the counties along the northwest border of California. Many old properties have been reopened, and new ones have been put in shape for working.

The most productive deep mines in Oregon continue to be those of the Cornucopia Mines Co. and Baker Mines Co., in the Cornucopia district, Baker county; Commercial Mining Co., in the Mormon Creek district; Columbia Gold Mines Co., in the Cracker Creek district; Homestead Iron Dyke, in the Iron Dyke district; and Humboldt Con. Gold Mines, in Malheur county.

The largest producers among the placer mines are the Powder River Dredge Co., in the Cracker Creek district, Baker county; Columbia Mines placer, in the Placer district, Josephine county; Sterling hydraulic, in the Forest Creek

NEVADA DOUGLAS PROPERTY, NEVADA.

POWDER RIVER GOLD DREDGING CO.'S DREDGE, OREGON.

district, Josephine county; and Layton, in the Applegate district, Jackson county. Baker continues to be the most productive county in the state, containing nearly all the larger mines.

SOUTH DAKOTA.

The Homestake mines and mills and the other smaller mills in the Black Hills, South Dakota, have been operated continuously, according to reports received by the Survey, producing approximately \$3,700,000 in gold for the first 6 months of 1916.

TEXAS.

The Presidio silver mine of Texas was in continuous operation during the first 6 months of 1916, and mining was also carried on actively during that period in the Van Horn and Sierra Blanca districts, all in the trans-Pecos country. The net result was a small output of copper, lead, and zinc.

WASP NO. 2 MILL, SOUTH DAKOTA.

but a production of silver for the first 6 months of fully 340,000 ozs.

UTAH.

The high prices of metals during the last 6 months caused Utah producers to put all available miners to work getting out ore. In some of the snow-bound camps large quantities of ore were stored during the winter months and when this was released to the buyers a curtailment was requested by the smelters of all producers exceeding contract limits. During May and June hundreds of cars of ore, waiting to be unloaded, blocked the railroad lines to sampler and smelters. Much of the ore is stockpiled, as it is impossible to treat more than a certain quantity on account of the limited working capacity.

Reports received by the Survey indicate that no great increase in gold may be expected for 1916, but silver production, which is dependent largely on the production of lead, has gained over previous years, principally from Bingham. The lead output from ores produced at this camp will exceed all former totals.

At the present rate of output, fully 225,000,000 lbs. of copper will be produced in 1916, this estimate having been made from the increased tonnage being treated at the concentration mills near Garfield. The Utah Copper property mined and shipped in May 911,000 tons of ore, and during June the rate of output was greatly increased and about 34,000 tons of ore was treated daily. Other copper mines are

GOLDEN REWARD MILL, SOUTH DAKOTA.

WASATCH MINES CO.'S PROPERTY, UTAH.

producing to the capacity of their equipment. At the increased rate of production and higher price, the total value of the copper output will probably be double that of 1915.

Zinc production from sulphide concentrate and oxidized and sulphide ores will not largely exceed the 1915 output of 22,000,000 lbs., estimated as spelter. Park City, Bingham, Tintic, and Promontory district were the principal regions producing.

Among the metallurgical improvements is the establishment of sulphuric acid works at Garfield and the prospect for treating lower-grade copper ores by leaching. At Silver City, in the Tintic district, the chloridizing leaching plant has made

its third shipment of silver precipitates, and the process is now considered a success.

WASHINGTON.

The mines of Washington, for the first 6 months of 1916, promised increased production in the five important metals for the year. Though shipments of zinc ore were made in 1915, the rate has been increased so that probably 1500 tons of material will be marketed for the half year, according to reports received by the Survey. Shipments of crude ore from the Norman mines, near Northport, and concentrates from the lead-zinc property at Metaline will result in a considerable production of spelter. About 100 tons of lead ore per month was being shipped to British Columbia, largely from the Bonanza mine, and the Electric Point mine near Northport is beginning to ship high-grade galena. The new lead smelting plant at Northport has been active with its two blast furnaces, and is constructing two additional furnaces. Though the plant treats principally Idaho material, it will treat custom ore when its capacity allows.

The production of copper will also be considerably increased, as shipments of crude ore and concentrate indicate a 10% increase from the Chewelah district alone. Steady shipments of siliceous gold ore from Republic have averaged 3000 tons a month, and are being increased at the end of the period.

The mining industry generally seems to be in better condition than for several years past.

THE MAXFIELD MINE, UTAH.

(A) FUELS

Coal Fields and Mining

Ashworth, James.—*The Composition of Natural Gas*. [Discussion on coal mine gases].—*Coal Age* July 22 1916; p 146; pp 1¼; 20c.

Brown, J. F. K.—*Imagination Applied to Mining*. [A review of the possible future as regards the transmission of electric power, pumping, etc. The cases are purely hypothetical].—*Coal Age* July 22 1916; p 142; pp 2¼; 20c.

Burrell, G. A.; Seibert, F. M.—*Gas Analysis as an Aid in Fighting Mine Fires*. [Discusses the change in air during a mine fire and the effects of gas on the fire and its origin. Methods of sampling and analyzing are given].—*U. S. Bur. of Mines Tech. Paper* 13; pp 16*.

Gray, F. W.—*The Coal Trade in Nova Scotia During the First Half of 1916*. [Figures on production and a review of the conditions of the trade].—*Canadian Mg. Jnl.* July 15 1916; p 339; pp 1¼; 35c.

Yuvenaliev, N.—*On the Liberation of*

Gas in Mines. [From the Gorno-Savodskoie Dielo, explaining the causes for the liberation of mine gases].—*Coll'y Guard.* July 7 1916; p 17; pp 1¾*; 35c.

— *Chinese Mineral Industry in 1915*. [A review of the production of refined metals].—July 8 1916; p 477; pp ¾; 35c.

Coal and Coke By-Products

Hamilton, Robert.—*Recovery of By-Products from Blast Furnace Gases*. [Brief reviews of several methods and the progress being made in this work].—*Jnl. of Soc. of Chem. Ind.* June 30 1916; p 663; pp 2¼; 35c.

Hamilton, W. R.—*The California Gasoline Industry*.—*Bull. A. I. M. E.* June 1916; p 1073; pp 5; 35c.

— *Smokeless Fuel, Gas, Oil and Ammonia Production*. [A description of equipment used and some details on the methods of operation].—*I. & C. Tr. Rev.* July 7 1916; p 10; pp 2*; 35c.

Petroleum

Arnold, Ralph.—*Conservation of the Oil and Gas Resources of the Americas*. [Reviews the deposits and possibilities of each country separately].—*Eco. Geol.* June 1916; p 299; pp 28; 60c.

Hopkins, Oliver B.—*Structure of the Vicksburg-Jackson Area, Mississippi*. [Geologic review of the area, bringing features showing the possibilities of oil and gas].—*U. S. G. S. Bull.* 641-D; pp 28*.

Stebinger, Eugene.—*Possibilities of Oil and Gas in North-Central Montana*. [Reviews the geologic structure and formation similar to that of other nearby fields].—*U. S. G. S. Bull.* 641-C; pp 43*.

— *Chinese Mineral Industry in 1915*. [A review of the production of refined metals].—July 8 1916; p 477; pp ¾; 35c.

Natural Gas

Arnold, Ralph.—*Conservation of the Oil and Gas Resources of the Americas*. [Reviews the deposits and possibilities of each country separately].—*Eco. Geol.* June 1916; p 299; pp 28; 60c.

Hopkins, Oliver B.—*Structure of the Vicksburg-Jackson Area, Mississippi*. [Geologic review of the area, bringing features showing the possibilities of oil and gas].—*U. S. G. S. Bull.* 641-D; pp 28*.

Johnson, R. H.; Huntley, L. G.—*Principles of Oil and Gas Production*. [Treats on the nature and genesis of the deposits, methods of drilling and prospecting, methods of operating and last an economic geological review of oil and gas].—Wiley & Sons; book; pp 371*; \$3.75.

Stebinger, Eugene.—*Possibilities of Oil and Gas in North-Central Montana*. [Reviews the geologic structure and formation similar to that of other nearby fields].—*U. S. G. S. Bull.* 641-C; pp 43*.

(B) STRUCTURALS AND CERAMICS

Cement

Brantly, J. E.—*A Report on the Limestones and Marls of the Coastal Plain of Georgia*. [The geology of the formation and descriptions of deposits by counties. The uses and preparation of the rock are also given].—*Georgia Geol. Surv. Bull.* No. 21; pp 300*.

Stone, Ralph W.—*Gypsum in 1915*. [Reviews the uses, methods of refining and production].—*Min. Res. of U. S.* II:14; pp 9.

— Mason City, Iowa, Plant of the Northwestern States Portland Cement Co.—Chem. Eng. & Mfg. July 1916; p 6; pp 1½; 30c.

Clays, Ceramics

Arbogast, C. O.; Sheridan, L. J.—*Throwing the Searchlight on the Clay Plant Pyrometer*. [A description of the pyrometer and its uses].—B. & C. Rec. July 18 1916; p 123; pp 3½*; 35c.

Greaves-Walker, A. F.—*The Path to Success in Operating a Continuous, Coal-Fired Tunnel Kilm.*—B. & C. Rec. July 18 1916; p 133; pp 2½; 35c.

Concrete

Hool, G. A.—*Reinforced Concrete Construction*. [Details on the design and construction of all types of concrete structures].—McGraw-Hill Co.; book; pp 688*; \$5.

Hunner, H. H.—*Concrete Idler Stands*. [A type constructed and used at the Isabella mine, Palmer, Mich. Some costs of construction are given].—E. & M. J. July 22 1916; p 179; pp 1*; 25c.

Lime

Brantly, J. E.—*A Report on the Limestones and Marls of the Coastal Plain of Georgia*. [The geology of the formation and descriptions of deposits by counties. The uses and preparation of the rock are also given].—Georgia Geol. Surv. Bull. No. 21; pp 300*.

Donaldson, R. D.—*Application of Central Station Power to Lime Plants and Quarries*.—National Lime Mfg. Assn. May 1916; pp 15.

— *The Plant of the Dolomite Products Co., Narlo, Ohio*. [The plant description includes excavating in the open-pit, on surface and haulage of the broken materials].—Excavating Eng. July 1916; p 371; pp 4*; 20c.

Stone

Bowles, Oliver.—*The Technology of Marble Quarrying*. [Takes up methods of operation and accounting with a study of the mineralogical constituents of the rock which tend to vary its properties and grade].—U. S. Bur. of Mines Bull. 106; pp 174*; 40c.

Brantly, J. E.—*A Report on the Limestones and Marls of the Coastal Plain of Georgia*. [The geology of the formation and descriptions of deposits by counties. The uses and preparation of the rock are also given].—Georgia Geol. Surv. Bull. No. 21; pp 300*.

Hicks, H. L.—*Compressed Air at Rockland Lake Quarry, New York*. [Describes drilling and blasting operations, with some information on the general operation of the quarry].—Comp. Air July 1916; p 8035; pp 4*; 20c.

III. TECHNOLOGY

MINES AND MINING

Prospecting

De Kalb, Courtenay.—*Surficial Indications of Copper*. [Discussion on a paper of the same title by Frank H. Probert].—M. & S. P. July 22 1916; p 115; pp 1¼; 20c.

French, Harold.—*Prospecting: A Suggestion*. [Describes a theoretical method of systematic prospecting for a syndicate].—M. & S. P. July 22 1916; p 117; pp 1½; 20c.

Storms, William H.—*Outcrops and the*

Prospector. [Tells of the geologic nature and appearance of an outcrop and what the same would signify. In most instances particular cases are cited].—M. & S. P. July 22 1916; p 129; pp 4*; 20c.

Drilling and Boring

Balcomb, J. C.—*A Remarkable Tunnel Rapidly Driven in Brazil*. [Gives details of operation, with drawings. A bonus system and unusual method of blasting are described].—Comp. Air July 1916; p 8040; pp 5*; 20c.

Hicks, H. L.—*Compressed Air at Rockland Lake Quarry, New York*. [Describes drilling and blasting operations, with some information on the general operation of the quarry].—Comp. Air July 1916; p 8035; pp 4*; 20c.

Warren, H. M.—*Electrical Distribution and Application in Mines*. [Speaks of the use of electricity for pumps, hoists, locomotives, drilling and air compression].—Coal Age July 22 1916; p 138; pp 4*; 20c.

Explosives and Blasting

Balcomb, J. C.—*A Remarkable Tunnel Rapidly Driven in Brazil*. [Gives details of operation with drawings. A bonus system and unusual method of blasting are described].—Comp. Air July 1916; p 8040; pp 5*; 20c.

Hicks, H. L.—*Compressed Air at Rockland Lake Quarry, New York*. [Describes drilling, and blasting operations, with some information on the general operation of the quarry].—Comp. Air July 1916; p 8035; pp 4*; 20c.

Tunnels and Tunneling

Balcomb, J. C.—*A Remarkable Tunnel Rapidly Driven in Brazil*. [Gives details of operation, with drawings. A bonus system and unusual method of blasting are described].—Comp. Air July 1916; p 8040; pp 5*; 20c.

— *Ingenious Special Devices for Tunnel Surveys*. [Abst. from Eng. News. Instruments and devices for marking are described].—E. & M. J. July 22 1916; p 180; pp 1¼*; 25c.

Pumps and Pumping

Brown, J. F. K.—*Imagination Applied to Mining*. [A review of the possible future as regards the transmission of electric power, pumping, etc. The cases are purely hypothetical].—Coal Age July 22 1916; p 142; pp 2¼; 20c.

Warren, H. M.—*Electrical Distribution and Application in Mines*. [Speaks of the use of electricity for pumps, hoists, locomotives, drilling and air compression].—Coal Age July 22 1916; p 138; pp 4*; 20c.

Mine Gas

Ashworth, James.—*The Composition of Natural Gas*. [Discussion on coal mine gases].—Coal Age July 22 1916; p 146; pp 1¼; 20c.

Burrell, G. A.; Robertson, I. W.—*Effects of Temperature and Pressure on the Explosibility of Methane-Air Mixtures*. [A review of the results of experimental work].—U. S. Bur. of Mines Tech. Paper 121; pp 14*; 15c.

Burrell, G. A.; Seibert, F. M.—*Gas Analysis as an Aid in Fighting Mine Fires*. [Discusses the change in air during a mine fire and the effects of gas on the fire and its origin. Methods of sampling and analyzing are given].—U. S. Bur. of Mines Tech. Paper 13; pp 16*.

Yuvencieff, N.—*On the Liberation of Gas in Mines*. [From the Gorno-Savodskoie Dielo, explaining the causes for the

liberation of mine gases].—Coll'y Guard. July 7 1916; p 17; pp 1½*; 35c.

Hoists and Hoisting

Hunner, H. H.—*Concrete Idler Stands*. [A type constructed and used at the Isabella mine, Palmer, Mich. Some costs of construction are given].—E. & M. J. July 22 1916; p 179; pp 1*; 25c.

Warren, H. M.—*Electrical Distribution and Application in Mines*. [Speaks of the use of electricity for pumps, hoists, locomotives, drilling and air compression].—Coal Age July 22 1916; p 138; pp 4*; 20c.

Power Shovels and Excavators

Brantly, J. E.—*A Report on the Limestones and Marls of the Coastal Plain of Georgia*. [The geology of the formation and descriptions of deposits by counties. The uses and preparation of the rock are also given].—Georgia Geol. Surv. Bull. No. 21; pp 300*.

— *The Plant of the Dolomite Products Co., Narlo, Ohio*. [The plant description includes excavating in the open-pit, on surface and haulage of the broken materials].—Excavating Eng. July 1916; p 371; pp 4*; 20c.

Transport

McBride, Wilbert G.—*Motor Truck Operation at Mammoth Collins Mine, Schultz, Arizona*. [Abst. from the proceedings of the A. I. M. E., reviewing costs and what can be done with a motor truck].—Mg. World July 22 1916; p 145; pp 1¼; 10c.

Warden-Stevens, F. J.—*Coal Shipping from South Africa*. [Describes several shipping appliances and arrangements].—Coll'y Guard. June 30 1916; p 1229; pp 2¼*; 35c.

Production

Bancroft, Holland.—*The Bolivian Tin Industry*. [A paper read before the Pan-American Sci. Congress. Reviews the market conditions, production and prices, with information on methods of mining, milling and smelting].—M. & S. P. July 22 1916; p 119; pp 7*; 20c.

Dunlop, J. P.—*Secondary Metals in 1915*. [On the production of metals refined from scrap].—Min. Res. U. S. I:3; pp 8.

Gray, F. W.—*The Coal Trade in Nova Scotia During the First Half of 1916*. [Figures on production and a review of the conditions of the trade].—Canadian Mg. Jul. July 15 1916; p 339; pp 1¼; 35c.

Northrop, John D.—*Asphalt, Related Bitumens and Bituminous Rock in 1915*. [Reviews the production and industry for United States and foreign countries].—Min. Res. of U. S. II:13; pp 16.

Stone, Ralph W.—*Gypsum in 1915*. [Reviews the uses, methods of refining and production].—Min. Res. of U. S. II:14; pp 9.

— *Aluminum*. [On the production and conditions of the trade, with some information on the refining of the metal].—Engg. July 7 1916; p 9; pp 1; 35c.

Mining Costs

Balcomb, J. C.—*A Remarkable Tunnel Rapidly Driven in Brazil*. [Gives details of operation with drawings. A bonus system and unusual method of blasting are described].—Comp. Air July 1916; p 8040; pp 5*; 20c.

French, Harold.—*Prospecting: A Suggestion*. [Describes a theoretical method of systematic prospecting for a syndi-

cate].—M. & S. P. July 22 1916; p 117; pp 1½; 20c.

Hunner, H. H.—*Concrete Idler Stands*. [A type constructed and used at the Isabella mine, Palmer, Mich. Some costs of construction are given].—E. & M. J. July 22 1916; p 179; pp 1*; 25c.

Accounting and Engineering Show Results. [Argues that the accounting, executive and engineering departments should work in harmony].—Coal Age July 15 1916; p 104; pp 2¼; 20c.

Mining Miscellany

Scott, David B.—*Stoping Methods of the Miami Copper Co., Arizona*. On the methods of haulage and stoping used in extracting this large body. Several stoping methods are being used].—Bull. A. I. M. E. June 1916; p 1031; pp 17*; 35c.

Young, G. J.—*Nomenclature of Mining Methods*. [The names commonly used for different mining methods are classified and a description is given of the systems named by terms of common usage].—E. & M. J. July 22 1916; p 175; pp 3¼; 25c.

MILL AND MILLING

Crushing, Grinding, Etc.

Brantly, J. E.—*A Report on the Limestones and Marls of the Coastal Plain of Georgia*. [The geology of the formation and descriptions of deposits by counties. The uses and preparation of the rock are also given].—Georgia Geol. Surv. Bull. No. 21; pp 300*.

Flotation

Ralston, O. C.; Allen, Glen L.—*The Flotation of Oxidized Ores*. [Discusses problems encountered in flotating different kinds of oxide ores. The results of some tests are given].—Mg. World July 22 1916; p 137; pp 3¼; 10c.

Concentration: Sorting, Sizing, Washing

Bancroft, Holland.—*The Bolivian Tin Industry*. [A paper read before the Pan-American Sci. Congress. Reviews the market conditions, production and prices, with information on methods of mining, milling and smelting].—M. & S. P. July 22 1916; p 119; pp 7*; 20c.

Gudgeon, C. W.—*Gold Scheelite Ore in New Zealand*. [Abst. from the bulletin of the Aust. I. M. E. The deposits and methods of concentration are described].—M. & S. P. July 22 1916; p 136; pp 1*; 20c.

Sohnlein, M. G. F.—*Combination Pulp Classifier*. [A paper to be read before the A. I. M. E. The machine was designed because neither mechanical nor hydraulic classification of tin ores in Bolivia were satisfactory].—E. & M. J. July 22 1916; p 182; pp 1*; 25c.

Wolf, H. J.; Barbour, P. P.—*The Boulder County Tungsten District, Colorado*. [Reviews the operations and conditions in the district. The principal companies are named, milling practice is described and a schedule of prices for tungsten ore is given].—E. & M. J. July 22 1916; p 165; pp 4¼*; 25c.

CHEMISTRY AND ASSAYING

Chemistry

Young, S. W.; Moore, Neil Preston.—*Laboratory Studies on Secondary Sulphide Ore Enrichment*. [Confined to copper sulphides and the generation of hydrogen sulphide].—Eco. Geol. June 1916; p 349; pp 17; 60c.

Analysis

Burrell, G. A.; Seibert, F. M.—*Gas Analysis as an Aid in Fighting Mine Fires*. [Discusses the change in air during a mine fire and the effects of gas on the fire and its origin. Methods of sampling and analyzing are given].—U. S. Bur. of Mines Tech. Paper 13; pp 16*.

METALLURGY

Electrometallurgy

Efficiency in Electrolytic Extraction. [Describes the Greenawalt system of electrolytic extraction, patent 1,179,522].—Mg. World July 22 1916; p 147; pp 1¼*; 10c.

Thermic Metallurgy

Bancroft, Holland.—*The Bolivian Tin Industry*. [A paper read before the Pan-American Sci. Congress. Reviews the market conditions, production and prices, with information on methods of mining, milling and smelting].—M. & S. P. July 22 1916; p 119; pp 7*; 20c.

Brantly, J. E.—*A Report on the Limestones and Marls of the Coastal Plain of Georgia*. [The geology of the formation and descriptions of deposits by counties. The uses and preparation of the rock are also given].—Georgia Geol. Surv. Bull. No. 21; pp 300*.

Bregman, A.—*Operating a Small Copper Blast Furnace*. [Details of furnace operation and construction which cause trouble in a small plant and methods used for getting around the same].—E. & M. J. July 22 1916; p 171; pp 4*; 25c.

The Profits in Zinc Smelting. [A financial discussion of the zinc smelting industry].—Mg. Jnl. July 8 1916; p 476; pp 1½; 35c.

POWER AND MACHINERY

Electricity

Brown, J. F. K.—*Imagination Applied to Mining*. [A review of the possible future as regards the transmission of electric power, pumping, etc. The cases are purely hypothetical].—Coal Age July 22 1916; p 142; pp 2¼; 20c.

Seede, J. A.—*Electric Arc Welding Finds Many Uses in Mines and Mills*. [The author cites and describes practical applications of repairing parts with the electric arc].—Mg. World July 22 1916; p 133; pp 3¼*; 10c.

Warren, H. M.—*Electrical Distribution and Application in Mines*. [Speaks of the use of electricity for pumps, hoists, locomotives, drilling and air compression].—Coal Age July 22 1916; p 138; pp 4*; 20c.

Hydro-Electric

Pierce, H. J.—*Federal Water-Power Legislation*. [An address before the National Elect. Light Assn. on the conservation of coal and oil by using hydro-electric power and the lack of congress to provide for such development].—U. S. Senate Document 468; pp 12.

Compressed Air

Balcomb, J. C.—*A Remarkable Tunnel Rapidly Driven in Brazil*. [Gives details of operation, with drawings. A bonus system and unusual method of blasting are described].—Comp. Air July 1916; p 8010; pp 5*; 20c.

Buffum, F. D.—*Compressed Air for Sinking a Shaft*. [Abst. from Coal Age. Deals with methods of piping and handling the compressed air which was used entirely for power. Remedies for diffi-

culties encountered are given].—Comp. Air July 1916; p 8048; pp 3*; 20c.

Hicks, H. L.—*Compressed Air at Rockland Lake Quarry, New York*. [Describes drilling and blasting operations, with some information on the general operation of the quarry].—Comp. Air July 1916; p 8045; pp 4*; 20c.

Warren, H. M.—*Electrical Distribution and Application in Mines*. [Speaks of the use of electricity for pumps, hoists, locomotives, drilling and air compression].—Coal Age July 22 1916; p 138; pp 4*; 20c.

Steam and Steam Engines

Dorman, H. R.—*Data on the Use of Water Softener for Boiler Feed Water*. [A paper read before the Wisconsin Soc. of Eng.].—Chem. Eng. & Mfg. July 1916; p 22; pp 1¼*; 30c.

Steam Flow Into a Compound Steam-Turbine. [Deals with the development of several formulas by use of calculus].—Engg. July 7 1916; p 1; pp 2*; 35c.

Gas Producers, Producer Gas

Trautshold, R.—*Gas Producer Control*.—Pract. Eng. July 15 1916; p 614; pp 1½; 20c.

Miscellaneous Power and Machinery

Brown, J. F. K.—*Imagination Applied to Mining*. [A review of the possible future as regards the transmission of electric power, pumping, etc. The cases are purely hypothetical].—Coal Age July 22 1916; p 142; pp 2¼; 20c.

IV. MISCELLANEOUS

Miscellaneous Costs

McBride, Wilbert G.—*Motor Truck Operation at Mammoth Collins Mine, Schantz, Arizona*. [Abst. from the proceedings of the A. I. M. E., reviewing costs and what can be done with a motor truck].—Mg. World July 22 1916; p 145; pp 1¼; 10c.

Testing

Ralston, O. C.; Allen, Glen L.—*The Flotation of Oxidized Ores*. [Discusses problems encountered in flotating different kinds of oxide ores. The results of some tests are given].—Mg. World July 22 1916; p 137; pp 3¼; 10c.

Young, S. W.; Moore, Neil Preston.—*Laboratory Studies on Secondary Sulphide Ore Enrichment*. [Confined to copper sulphides and the generation of hydrogen sulphide].—Eco. Geol. June 1916; p 349; pp 17; 60c.

Metallography

Harley, Andrew.—*Testing Malleable and Cast Steel*. [An address before the British Foundrymen's Assn. An English view on the scientific manufacture of small castings].—I. Tr. Rev. July 20 1916; p 121; pp 7*; 25c.

Conservation

Arnold, Ralph.—*Conservation of the Oil and Gas Resources of the Americas*. [Reviews the deposits and possibilities of each country separately].—Eco. Geol. June 1916; p 299; pp 28; 60c.

Pierce, H. J.—*Federal Water-Power Legislation*. [An address before the National Elect. Light Assn. on the conservation of coal and oil by using hydro-electric power and the lack of congress to provide for such development].—U. S. Senate Document 468; pp 12.

Ore and Metal Markets; Prices-Current

New York, Aug. 3, 1916.

Silver.—Quotations for silver per fine ounce at New York and per standard ounce at London for the week ended Aug. 2 were as follows:

		New York. Cts.	London. Pence.
July	27	63 $\frac{3}{4}$	30 $\frac{3}{4}$
	28	63 $\frac{3}{4}$	30 5/16
	29	65 $\frac{1}{4}$	30 5/16
	31	64 $\frac{3}{4}$	30 9/16
Aug.	1	64	30 $\frac{1}{2}$
	2	61	30 $\frac{1}{2}$

MONTHLY AVERAGE PRICES OF SILVER.

Month.	New York			London Standard Oz.		
	High.	Low.	Avg.	1915. Avg.	1916. Avg.	1915. Avg.
January	57 $\frac{1}{2}$	55 $\frac{1}{2}$	56.775	48.890	26.875	22.744
February	57	56 $\frac{1}{2}$	56.755	48.477	27.000	22.759
March	60 $\frac{1}{2}$	56 $\frac{1}{2}$	57.935	49.926	27.080	23.650
April	73 $\frac{1}{2}$	60 $\frac{1}{2}$	64.415	50.034	31.375	23.259
May	77 $\frac{1}{2}$	68 $\frac{1}{2}$	73	49.915	34.182	23.560
June	68 $\frac{1}{2}$	62 $\frac{1}{2}$	64.175	49.072	31.038	21.577
July				47.519		22.950
August				47.178		22.760
September				48.68		23.600
October				49.385		23.923
November				51.713		24.640
December				55.038		26.232
Year				49.690		23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—A reaction from the feeling of despondency which characterized the attitude of sellers a week ago appears to have set in. Early in the period the tone suddenly changed for the better, prices showing a steady advance from day to day. The change followed the making of sales in the open market of approximately 6,000,000 lbs. at a fraction over 24c, and, while no similar buying has since been done, the orders have been coming in increasing number and size up to the present time. With the growing movement, sellers have been encouraged to raise their prices, and are now standing firm on the basis of 24 $\frac{3}{4}$ c for third quarter of the year delivery. The fact that the large interests have not changed their nominal quotations, though credited with having recently closed some substantial contracts for deliveries over the last quarter at prices a cent and a quarter a pound below those they quote, is accepted as a good sign.

There has been some buying done for export, but sales in that direction have not been important. The general expectation seems to be that export contracts must come before long. This view is shared by at least one of the leading trade authorities, who says: "We may get a big export order next week, and it may come a month later, but it is surely coming. For our part it would please us better if this business did not come until late in September or October. We are sold so far ahead that it is difficult for us to keep our heads above water. When you consider that the largest sellers are practically booked up for the remainder of the year you can realize the excellent undercurrent of the market. We are not worrying about orders at present because it is not usual to book so far ahead, and we have in hand business for a period longer than ever before in our history. In years past we would have considered it abnormal to take business for 90 days ahead and now we could accept orders for at least the first quarter of next year, or nearly 9 months ahead. With the placing of expected foreign orders the domestic consumers will come along with large purchases. This is copper trade history. Users in this country will not enter the market during a dull period, despite the possibility of concessions in prices, but when the quotation has been established firmly because of some large contract, the manufacturers in this country who use the metal become the leading purchasers and bid the price up against one another."

There are some who are disposed to attribute the sudden

change in sentiment here to the jump of £5 in the price of standard copper in London last Friday, but, while that no doubt was a potent influence, the improvement had begun to make itself evident before that. Inquiries had been and are still coming from all consuming quarters of the country, some of them for round lots, and in the aggregate the amount of business that is being offered to dealers is quite large. A number of the smaller sellers who had been seeking orders for nearby copper at 25@26 cts. are now demanding and getting $\frac{1}{2}$ ct. a pound more than those figures. Producers and dealers who may be called middle class, are asking up to 27 cts. for October and 26 $\frac{3}{4}$ cts. for November and December.

Despite the recent upturn in prices, representatives of the leading producing interests intimate that a readjustment of market values on a lower level is a probability of the near future. One of them is quoted as saying that the next important buying movement, which is expected between the present time and the middle of next month, will be on the basis of 23@25 cts. a pound. Europe, it is believed, will be in the market for large tonnages of copper within that period, and that this will be a signal for price readjustment resulting in a market on which consumers can do business. On the other hand, the opinion is expressed by prominent consumers that prices will remain near the present level for months to come, although it is possible that slight concessions may be made, which, however, bring out buying orders in such number as to immediately cause a hardening of the market for last quarter metal.

Not a little of the buying done on home account during the past few days was against business already done by manufacturers who had not anticipated requirements in copper to cover their orders for finished goods. Others who are said to be receiving some good orders from agents of the allies involving material for use in making munitions are contracting for copper to cover this business.

Casting copper has shared in the general improvement, some lots of considerable size having changed hands. Early in the week 24 $\frac{1}{2}$ cts. was accepted, but later sales were at 25 cts. The larger interests were said to be the sellers.

Tin.—The brighter prospects of a week ago have not been enhanced by any pronounced increase in the buying of either spot or future tin. While some trading in both positions has been done the aggregate volume of business has not been large. However, the undertone has been strong throughout and there has been a gradual advance in prices of straits tin, which, however, the recent arrival of 1300 tons of Banca may have a tendency to hold in check. At the present price, however, sellers do not seem to be eager to do business, because of the light arrivals of straits during the past month and the limited quantity of it that is available for immediate delivery. While spot trade is restricted within narrow limits, business recently done for future delivery has been of fairly large volume, though much of it was handled by a few sellers. The effect of these transactions has been to impel the cheap sellers to withdraw and the market for futures closes at least 1 ct. a pound above the low point.

Quotations on tin per pound at New York and at London per ton for the week ending Aug. 2 were as follows:

Lead.—The orders for export which for a time imparted a better tone to the market, having been neither many nor large, the market has relapsed into the condition of apathy which had previously characterized it. While no actual weakness has been shown by selling pressure at price concessions there is an undertone of weakness which is attributable to the belief that while no official notice has been given of an impending change the American Smelting & Refining Co. is on the eve of reducing its quotations. The

buyers sensing this have been withholding orders except those made necessary by requirements of the moment.

Quotations on lead per pound at New York and per ton at London for the week ending Aug. 2 were as follows:

Lead Ore.—Conditions during the week ended July 29 were practically as during the previous week in the Missouri-Kansas-Oklahoma district. The prices were as during the previous week also and most of the ores brought \$70, though some few lots brought \$72. Concentrates produced in the district during the week totaled 1,908,630 lbs., bringing the total for the year to date at 62,776,212 lbs. Their values were given as \$68,790 and \$2,739,471.

Zinc Ore.—As with lead, zinc ores in the Missouri-Kansas-Oklahoma district during the week ended July 29 were as during the previous week, except for the lower grades, which showed a stronger condition. The better grades sold at \$75 and the lower grades sold at \$55 as against \$50 of the previous week. Concentrates produced in the district during the week amounted to 9,101,550 lbs. and the total for the year was 402,805,241 lbs. These were given values of \$302,478 and \$18,639,268.

Calamine.—No change was noted in this market, and ores continued to sell at from \$40 to \$50 during the week. There were produced 132,920 lbs. of concentrates and the total for the year was given at 19,160,420 lbs., these being valued respectively at \$2904 and \$707,752.

Spelter.—The little boom started a week ago by inquiries from Great Britain and France seems to have petered out. It is true that some export business resulted, but its effect was not supplemented by any domestic buying to speak of. Since then the market has gone off and shows a tendency to recede further. In the opinion of some people in the trade, however, the depression is not expected to last, as the foreign demand promises to be a factor to reckon with, and they believe that it is going to manifest itself in additional export buying of a more pronounced character than that of last week before very long. In the meantime the home trade is apathetic and the market closes dull and easy.

*For the first nine months; spot market nominal thereafter.

MISCELLANEOUS METALS.

Quicksilver.—The expectation of a further decline was realized on Saturday when selling agents made a cut of \$2 a flask in their price. But at \$78 there appears to be no greater interest felt in the metal than at the lower figure. With no demand from the ammunition makers, and other consumers buying from hand to mouth, the indications point to a further recession, for while there have been no further arrivals of consequence there is understood to be a good deal of unsold stock on the market, and recently there have been current reports of reselling by makers of explosives.

Antimony.—There have been some inquiries in the market, but so far they do not appear to have resulted in business. The downward trend of prices has continued and offerings are now made at 14¼ cts., or ¾ ct. below the price quoted a week ago.

Nickel.—There is very little demand from home consumers and not much inquiry for export, but the market remains steady, with ordinary forms quoted at 45@50 cts. per pound as to size and terms of order. Electrolytic is held at a premium above these figures.

Aluminum.—Demand has been only fair, deliveries on contracts appearing to be sufficient to cover most of the current requirements of consumption. Quotations are maintained at 59@61 cts. per pound for No. 1 ingots, New York.

Platinum.—Without further change in price, the market is dull and lacks strength. The nominal quotation is \$60.

Pig Iron.—Foreign inquiries for Bessemer and for high and low phosphorus iron are still coming in, but nothing much has come of them during the past week, or at least no reliable reports of actual business are heard. On domestic account, however, some trading has been done, but the quantities changing hands were not important. The tone of the market continues strong and among leading trade authorities

no material change in the situation is expected for some time to come.

Ferromanganese.—The situation presents no new features. With little demand the market is steady on the contract basis price of \$175. Spiegeleisen also lacks movement of consequence, but is held steadily at \$45@50 for 20% at the furnace.

Nevada Douglas Mines and Mill

By W. A. SCOTT.

Nevada Douglas Con. Copper Co. controls the Ludwig, Douglas Hill, Copper Casting and other mines in Yerington, or Mason district, Nevada. This group is on the western slope of the range of hills separating Mason valley from Smith valley. A railroad was built several years ago from Wabuska to Yerington, Mason and Ludwig, the last named being the terminal

are accomplished by running drifts southward on the vein from all 100-ft. stations. A plunger pump, on the 800-ft. level, lifts 100 gals. of water per minute, during 8 hour shift, keeping the lower workings free of water and supplying sufficient for mill work. The Ingersoll-Rand electric-driven air-compressor furnishes power for 30 piston and Waugh drills.

MILLING PLANT OF NEVADA DOUGLAS CON. COPPER CO.

station, situated at Nevada Douglas mines. This railroad is operated and controlled by Nevada Douglas interests. It connects with the Southern Pacific at Wabuska, and affords good transportation facilities to the upper Walker river region.

The Ludwig is the company's principal mine, so far as current operations are concerned. It is operated through an 800-ft. shaft, sunk at an inclination of 50°. It has two compartments, in which two 2-ton skips are operated by a Wellman-Seaver-Morgan double-drawn electric hoist. The position of the shaft corresponds to the dip of the contact vein in which the copper ore occurs. Development and production

The principal vein is at the contact of granodiorite and limestone, the vein material being limonite, hematite and silica. The one, from the surface to the 600 level, consists of oxides and carbonates of copper, with some silicate of copper. There occurs here the red and black oxides, and secondary chalcocite. Water was found at a depth of 600 ft. on the incline, and the one between the 600 and 800 consists of chalcopyrite, and a secondary chalcocite. The ore body on the 800 level has a width of 200 ft. and a length of 700 ft., striking north and south. At this depth the vein walls are clearly defined. The company is now mining and hoisting 150 tons of ore per day, working

two shifts. About 50 tons of this runs 14% copper, being carbonates and oxides, and is shipped to Utah smelters; the other 100 tons of the daily production, consisting of carbonates, oxides and sulphides, carries 5% to 5½% copper, and is taken to the mill in steel side-dump cars. All ore carrying 7% copper or lower is reserved for mill treatment. The data given above relate to the Ludwig mine.

Concerning the Douglas Hill, which adjoins the Ludwig on the south, there is much of interest. Since it was opened 8 to 10 years ago, 75,000 tons of oxide and carbonate ore, running 5 to 7% copper, has been shipped to smelters. Its ore bodies were opened by two tunnel levels, one of them 150 ft. and the other 400 ft. below the apex of the contact, the sulphide ore having been cut into by the lower level. It is estimated that 100,000 tons of ore has been exposed by existing workings. This part of the property is well situated for conveying ore to the mill by gravity. The Copper Casting mine, still farther south, has been developed through a 350-ft. vertical shaft. A big tonnage of 8% copper ore was mined and shipped some years ago. Ernest Warr, mine superintendent, states that not much timbering is necessary in Ludwig mine, because the shrinkage system is employed, whereby the stopes are filled and the ore drawn out through chutes below.

Crushing and Leaching.

The most important and most interesting phase of the Nevada Douglas operations is its copper extraction plant and the method employed. The crushing plant contains no unusual features. The crushing, screening and pulverizing, reducing the ore to minus 60 mesh, and delivering it to the fine ore bins, is a dry process. Through this stage of the operations the sulphides are kept separate from the carbonates and oxides. The ore from the mine is dumped from haulage cars into six bins of 200 tons capacity each, about one-fourth of their capacity being for sulphide ore and three-fourths for oxides, carbonates and mixed ores. The ore is drawn from the bins through feeders to a 175-ft. belt conveyor, which carries it upward at an angle of 40°, discharging it upon grizzlies, the oversize from which passing to a Blake crusher, and the undersize first to toothed and then to corrugated rolls. This product is elevated to a set of grizzlies, undersize of which is further reduced by intermediate rolls, the oversize being returned to the corrugated rolls. The product of intermediate crushing, reduced to ½-inch size, is passed to intermediate bins, and from them is fed to Sturtevant 60-mesh duplex rolls. This last roll product is run dry through Newago vibrating screens, the undersize going direct to the fine ore bins; the oversize is returned to rolls and thence to a tube mill, the product of the latter going to the fine ore bins.

The metallurgical process by which the fine ore is now treated is best described by George C. Westby, chemist and metallurgist for the company, who furnishes the writer the following:

"The fine ore leaves the crushing plant in two streams. The sulphide ore is conveyed to the Wedge roasters, and the oxidized ore is discharged directly to the fume absorption tanks. The sulphide ore, consisting of about one-fourth of the total ore treated, is given a sulphatizing roast, which oxidizes the iron and copper minerals and develops large volumes of sulphurous acid smoke. The calcined material is sluiced to the absorption tanks and the acid smoke is, by means of an acid fan, driven into the absorption tanks; thus, again being brought into contact with material from which it was developed. At the same time, dry oxidized ore is discharged from the fine ore bin directly into the absorption tank, bringing about a mixture of sulphurous smoke, calcine, fine oxidized ore and water, or barren liquors.

"The absorption tanks, in which the mixture occurs, consist of a series of tanks through which the pulp and smoke pass in opposite directions, the pulp passing progressively to the discharge from the highest tank to the lowest in the series. The interior of the tanks contains a lattice work of slats, which is designed to form a large contact surface over which the pulp is caused to spread in films. The pulp is maintained directly in the path of the acid gases by means of four large sand pumps, which draw the fallen material from the bottom of the tanks, and again return it to distributing devices at the tops of the tanks. A fractional portion is caused to flow continuously from each tank to that next below it. The contact of hot acid gases with the pulp causes rapid action on the soluble constituents of the ore. The discharge from the lowest absorption tank is conveyed to the washing and clarifying system. The material treated in this part of the process consists of fines ground to minus 60 mesh. In order to completely utilize the last traces of the gas, the impoverished gases are passed into sulphurizing towers in which complete neutralization is effected."

The rich solution is passed through a Trent filtration tank, and the copper is precipitated on scrap iron, recovering 75 to 80%. The intention is to install electrolytic cells for depositing out the copper electrolytically, thus dispensing with the old precipitation method. Additional equipment is being put in by which the plant capacity may be brought up to 250 tons per day. W. C. Orem, Salt Lake City, is general manager; A. J. Orem, being in direct charge and as general superintendent.

Tennessee Co. Improvements.—The Tennessee Coal, Iron & Railroad Company announces plans for several improvements. One is the installation of an electric furnace at Ensley for pre-heating ferromanganese and another is the doubling of the blowing capacity for the Bessemer end of the duplexing plant at Ensley by the installation of a spare engine. Further items on the program are the building of employees' bathhouses and school buildings at a number of the company's operations.

Ore Sampling Conditions in the West

By T. R. WOODBRIDGE.*

(Continued from page 185)

The investigation has been limited to the sampling of the ores of gold, silver, lead, copper and zinc. The sampling plants visited were in Colorado, Utah, Montana, Washington, Nevada and California. In all 48 mills, of 23 companies, were examined. At each plant a study of the equipment and practice was made and a flow sheet was prepared. In every instance except one the heartiest co-operation was shown and every assistance rendered for a thorough understanding of the plant and practice. A lively and most gratifying interest in the purpose of the investigation was shown and a large proportion of the men interviewed expressed a desire that some way might be found of eliminating inaccuracies and uncertainties. In almost every plant some idea that was the result of local experience, or experiment had been applied that would be of value to ore sampling practice as a whole, should the information be generally disseminated. On the other hand, in many of the mills were found one or more practices that elsewhere had been laboriously proven to be incorrect. Such information should also become a matter of general knowledge.

The very nature of the business of ore sampling is such that it can have no trade secrets. Costs can be and are guarded as a matter of business policy, but no concern can long exist in the ore-sampling business if the methods it employs are at all mysterious. Therefore much is to be gained by a full comparison of methods and the results of experimental work; it is a matter for each individual in the business to decide to what extent he wishes to co-operate. In accordance, it was agreed not to publish names or information that would serve to identify plants visited during the investigation, and in the discussion that follows the intent is to keep within the spirit of this understanding.

The flow sheets are intended to show the path of the ore from the car or receiving bin to the final sample sent to the assayer. Each flow sheet does not necessarily represent a separate sampling concern. One plant, for instance, has three distinct methods of obtaining what may be termed the first sample, but adopts a single method, that of coning and quartering, for the final reduction; hence the work of this plant is represented by four separate flow sheets. The method employed seemed to be the only feasible one for properly classifying the various systems.

In the practice of ore sampling there are many variations in the application of general theories, and in the construction and manipulation of the machines. In most of the plants visited these variations are clearly in the line of progress and tend to produce better and more dependable results, but in some plants these

variations are distinctly retrograde and lead to inaccuracies. A disinterested observer is more or less in doubt as to whether the plant he visits is attempting, if the plant treats its own ore, to show an apparently better extraction of metals, or, if it buys ores, to assure a safer margin for the ore-purchasing department.

In a number of plants the laws controlling the separation of the finer from the coarser particles seem to be well understood and their application well worked out, but in other plants these vital points are apparently not clearly understood. Long-used methods are continued, because it seems wise not to disturb conditions heretofore satisfactory from the operator's point of view, because of an unwillingness to acknowledge that a new method can be as good or as reliable as an older one, or because of the lack of dependable information on the general principles of sampling. In confirmation of the reasons given for the existence of these variations, it was noted that, although a number of them worked to the buyer's advantage, there were several instances where they were decidedly to his disadvantage.

In presenting the flow sheets and describing methods the author has attempted to show some of the good points as well as some of their inherent or special weaknesses. Some deductions as to the effects of certain practices on the accuracy of the various sampling methods employed are made and ways of obviating or mitigating these effects are suggested.

Even after an approved sampling system using accurately built machines has been installed and proper rules and regulations have been established, there still remains one disturbing factor—the personal equation of the workmen. Advantage is taken of certain of the conditions of sampling that may result in hardship to one or the other of the interested parties, whether through the instant of the workman to protect the interest of the buyer, his employer, or through the ore watcher, who represents the seller, not being inclined to call attention to any operation which would cause an excessive valuation; or through enjoyment of a shrewd bargain causing either party to take undue advantage where possible.

To impress the workman with the fact that perfect fairness to both buyer and seller is the important feature of the work is one of the most difficult problems. It does not belong to mechanics, nor is it entirely moral, but possibly would come under the heading of "psychology of ore sampling."

It is not the intention or desire of the author to place blame for this condition on any particular buyer or seller of ore, company, superintendent, or group of workmen; neither does he claim that such practices are confined to any particular locality or that erroneous

*Bureau of Mines. Excerpt from advance proofs, Technical Paper 86.

results are intentionally obtained at any particular plant. Decision regarding these matters must necessarily be left to the judgment of the individual in his relation with the plant. However, it is thought proper to discuss the effects of certain practices, whether intentional or accidental, on the accuracy of sampling, in the hope that a clearer understanding of them may work to the mutual advantage of both the buyer and seller of ores.

The Weighing of Loaded Ore.

Ore is generally weighed on railway platform scales, which vary in capacity from 60 to 100 tons. The scales are either placed under cover or in the open, and may be near the unloading plant or as much as half a mile from it. In the past 10 years the practice of weighing has improved greatly. In many districts the scales are tested at frequent though irregular intervals by the Western Weighing Association. These tests are made by the use of cars built especially for this service, and have resulted in general satisfaction. Where these cars are not available, it is necessary to use the 50-lb. test weights, of which every plant has 20 to 40. This system is far from satisfactory, for an undetected difference of 20 lbs. in a 2000-lb. weight would result in a 2000-lb. error in weighing 200,000 lbs.

It is the general practice to cover the space between the coping and the scale platform with a piece of old belting to prevent accidental jaming of the platform with pieces of rock. However, this practice is by no means universal, for some operators assert that the belting does not exclude the rock and prevents the constant inspection necessary to insure the free movement of the platform.

In most of the plants visited the weighing is carefully done, but a very bad practice noted in some instances is undue haste. Hasty weighing means that the weights and the rider must be rapidly shifted. In weighing the loaded car, the rider may be thrown far to the overweight position and then rapidly shifted back to a position of balance, the reading being taken as the indicator passes the center on the way up. This will cause the scales, especially if they are sluggish, to register too low a weight. If the tare weight be taken by first throwing the rider to an underweight position, the total difference may be seriously below the correct weight. If the practice is reversed, the net weight will be correspondingly too great.

A practice that has been ordered discontinued by the Western Weighing Association is that of weighing a slowly moving train of cars while coupled together. As the scales must be balanced and read quickly, frequently with the scale beam oscillating rapidly, the possibilities of error due to this practice are apparent. With scales that are too short for some of the longer cars it is customary to weigh separately the load on each set of trucks.

Everything connected with the scales should be kept

as free from dust as possible. At many plants the scale beam is situated in a closed room, far from the disturbing effects of the mill vibration, but unfortunately this practice is not universal. An old plan, which possibly is nowhere in use, was to keep on the rider several ounces of fine ore that was added to or taken from in balancing the scales. An error of several thousand pounds can be caused in the indicated weight of a carload of ore by this system. The weight of the rider is absolutely fixed at the factory and usually a seal is placed where the adjusting material is added or removed. This rider should be kept free from dust or dirt.

When ore is delivered to the plant by wagon, the roadway for a short distance at each end of the scale platform should be level. When the loaded or unloaded wagon is weighed the wagon brakes should be loose and the harness tugs slack. Several hundred pounds may be added to the net weighing by the horses straining in their collars when the loaded wagon is being weighed, or backing into the breeching when the empty wagon is being weighed. The driver and his assistant should occupy the same position during the weighing of the empty wagon as in the weighing of the loaded wagon.

(TO BE CONTINUED.)

Hoisting Bucket Compensates for Wear.

The cutting edges of shell-bottom hoisting buckets wear away rapidly, permitting leakage of the material between them. When the shells are in one piece, the whole bucket must be discarded when the edges are worn out. To obviate this difficulty, Carl Jacobson of Hamburg, N. Y., has designed a bucket with the

A NEW SHELL BUCKET.

bottom plates adjustable longitudinally, and his idea has been patented (No. 1,187,626).

The illustration shows one shell of the bucket. It is seen that the side walls are fastened to the bottom plate by means of a double set of rivets. When the cutting edge becomes worn, the rivets are removed and the side walls set back a short distance as shown, and then fastened by riveting through the second set of holes. The projecting edge of the bottom plate is then trimmed off flush with the side walls and the shell is as good as new.

Mining Possibilities in Colombia, S. A.—V

By MATT. W. ALDERSON.

In testing a placer property in Colombia I drilled 96 holes in 91 working days. The number of feet drilled was 2372, an average per day of 26. The deepest hole was 93 ft., and the average of all 24.8 ft. The total cost for labor and material was \$973.40, or a trifle more than 41 cts. a foot. Results speak more emphatically than anything else, and nothing I can say could be more complimentary to the native workman than the above figures.

I had in my employ in this work from 8 to as high as 16 men. Very few of these men were ever tardy. Several never missed a day. One who lived $3\frac{1}{2}$ miles away missed one day—when he stayed at home to pay his road tax. He left home at 4 o'clock every morning and got home at 7 every night.

The machine I used was not new. It had been shipped in 6 years before, used a few days and then left out in the weather. When the pipe was pulled out of the last hole it was pulled up bodily instead of being disconnected at the joints, so most of it was in too long lengths. It was impossible to disconnect the lengths without first heating in the fire and hammering. A native blacksmith did this for me and re-tempered the connections.

When I hear anyone speak in anything but complimentary terms of the laboring class in Colombia I am forced to the conclusion that he simply does not know how to manage men.

The man who contemplates placer mining in Colombia must expect to use native labor and he must know his ground. If he believes in the old theory that the gold in his deposit came from the milling down of quartz deposits higher up, and that he will be able to follow the gold up to this source, he will some day be most woefully undeceived. If he thinks when he once has bedrock all he has to do is to continue up stream and the bedrock will still be with him, he may be subjected to a very great surprise. The bedrock may drop out of sight; in other words, be 50 or even 100 ft. beneath the level on which he is working. Instead of going up or down stream, the deposit may go up hill on one side of the stream channel, and deep down under it, and be entirely disconnected from other deposits up or down the river. Ideas based on observations of channel deposits in some gulches in the western part of the United States will be revolutionized with experiences here. The old theories do not fit, and cannot be made to fit in any practical way, or by any possible stretch of the imagination.

When I was in Colombia a party was fitted out to explore a large tract of land where it was believed there was still unworked placer ground of value. The party went prepared to sink holes and pump wa-

ter with native pumps made of bamboo. Failure to get results that would be at all reliable or thorough could be foretold of such an expedition before it started. It wouldn't be possible for the present party to get to as low a depth as the natives could have reached, for the natives would have first pulled the stream flowing through the ground down to its lowest drainage level, which these people would not. If they found anything of value it would be by accidentally stumbling onto a piece of pay ground that the natives had overlooked, and they haven't overlooked very much.

There is only one way to test the placer ground of Colombia, or any other part of the world, and that is with a drill. In this way only can one be sure of being able to get to bedrock under water, whatever its depth may be, and it is under water only where he will be sure of finding pay. There is a drill made especially for this work. It does it to perfection. And when work is to be done, why not do it thoroughly, in the manner that its importance deserves?

Drilling holes in ordinary gravel is a very simple proposition; more trouble is experienced where the wash is compact and heavy, but it is here where the gold content is likely to be greater. In ordinary gravel the shoe at the foot of the drill tube is practically self-sharpening. Occasionally gravel will be found that is almost entirely pure quartz. In drilling gravel of this character the shoe wears off very rapidly on the outside, and thus becomes practically unfit for doing good work. The shoe must be put into the forge and the cutting edge turned out, or it may be sharpened to be as good as when new by cutting off the worn edge and cutting out places between the teeth with a cold chisel. Skill is required, of course, to properly retemper the shoe.

I found the greatest difficulty in drilling through sand. This I obviated to some extent by having everything in such shape that it would stand severe strain, then putting in two sweeps 20 ft. in length each, and several men on the end of each sweep. Even then I have pulled out of holes without having touched bedrock because I was afraid of putting more strain on the machine than it would stand.

A very compact, reddish or yellowish clay is very bothersome in some cases, particularly where the shoe is rounded on the outside edge. The reason for this is that the shoe cuts a smaller hole than the size of the pipe, and the pipe must force its way by making the hole larger. One drill man told me he had never been able to penetrate more than 6 ft. into clay of this character. Drilling this clay caused me much trouble, no matter what I attempted, until I

A SKILLED WORKER WITH BATEA.

had the shoe sharpened with the teeth pointed out so the shoe would cut a hole a quarter of an inch wider than the pipe. Then there was no more trouble, except that of pumping. Where the clay would work up in the water, progress could be made with little bother; but where it was so tough that it filled the pump with linked-sausage-like chunks we oftentimes concluded it best to stop.

To make any kind of progress, it is necessary at times to drive the pipe. The illustration shows clearly the best contrivance yet evolved for this purpose. It consists of a piece of hard wood $3\frac{1}{2}$ ft. in length with a strong iron band around the bottom. A piece of $\frac{3}{4}$ -in. gas pipe goes through it at 14 ins. from the bottom, and another piece sticks out from the top. The men on the platform use this driver easily and effectively.

Where it is necessary to drill deeper than 30 or 40 ft. the work on the men becomes so severe that poor progress will be made unless one has a drill especially fitted for deep work. I did not have, so rigged up a spring pole, as will be observed in accompanying illustrations, and had no difficulty in making borings as deep as it was necessary for me to go—75 to 93 ft.

experience shows that when the concave is flat or truly cylindrical it is possible for pieces of material to lock themselves between the separate feeding teeth and stay there bouncing about without being positively caught by one of the teeth. The shape of this con-

FIG. 1

FIG. 2.

Improvement in Crushing Machines.

A crushing roll which will not clog is described in a patent (1,187,549) granted to Axel G. J. Rapp of Chicago, Ill., and assigned by him to the Link Belt Co. It is designed for comparatively soft materials, such as coal, being of the concave-plate, rotating-roll type, the latter being provided with crushing lugs and pointed, removable teeth as shown in Fig. 1. These facilitate the passage of the material through the roll when operating in conjunction with the peculiarly formed concave plate shown in Fig. 2.

The cutters or teeth and the method of mounting them in the removable jackets on the face of the roll are shown in Fig. 3. They are provided with serrated sides, and by means of the unique wedging arrangement are made adjustable to wear and grinding.

The concave Fig. 2 is made up of a series of separate, irregularly curved surfaces. These are tilted, and the bounding lines converge as indicated so that they tend to feed or discharge the material centrally from both sides toward parallel lines. The arrangement of the device is such that these parallel lines toward which the material is fed are the lines along which the teeth are located. The result is that the objects or particles fed into the machine, as they pass down toward the crushing point, are fed across the concaves toward the lines of action of the grabbing or feeding teeth.

The long feeding teeth catch this material and draw it down into the gradually decreasing space between the concave and roll so that it may be crushed and broken by the small knobs on the roll (Fig. 1). But

FIG. 3.

cave, however, is such that it cannot happen. The material resting on the high points must of necessity pass down to one side or the other into the channel or groove and there be caught by the feeding tube.

Air and Temperature in Deep Mining

The deepest mine works in any part of the world are in Brazil. One of the mines of the St. John del Rey Mining Co., Ltd., has reached the vertical depth of 5826 ft., and since the vein shows no sign of losing its size or value the company is considering means of continuing to a vertical depth of 7626 ft. The question seems to be one of temperature and air supply. Supt. G. Chalmers, in his report of the Morro Velho mine, discusses ventilation of the workings at these depths.

The system of distribution of the air is becoming, as greater depth is attained, defective, and requires modification. On rare occasions the downcast air at the bottom of the mine is comparatively low in moisture, by the time it has passed over two horizons. Consequently the efficiency of the men on the stopes above is considerably impaired; in fact, 86° wet bulb (which represents the conditions of, say, horizon 16, at any rate during the rainy season) is supposed to be the limit at which men can work with full efficiency, and as the mine deepens this will, of course, be more seriously felt. But by largely increasing the volume of air passing through the deepest explorations, and by leading the allotted quantity (after it has passed over the stopes of one horizon, or at the outside two) directly to the upcast and away to the surface, instead of passing it over the stopes above as in the old and existing system, the best possible conditions will be obtained.

Due to the fact of our now being in a much better position as regards the mainway into depth, namely, of its being in advance of the explorations, Captain Watts has proved that it is possible to work each block by one vertical winze only, and our calculations show that this one winze and a steel pipe of 3 to 4 ft. in diameter will, with the eastern paved airway, give ample ventilation to the stopes during the working out of a block of mineral. Consequently, one winze for mineral and filling to act as a temporary upcast, which during the working out of each block disappears as the mineral is removed, is sufficient for the mining operations, and by sinking another vertical winze from one horizon to the other, never less than 50 ft. from the average line of the north wall of the lode, and some connecting tunneling, a permanent return airway will be formed at a cost no greater than that of the old system of working out each block with two vertical winzes and a western wood-block airway and the eastern paved airway, as the large saving in the temporary western airway in the form of a 3 to 4 ft. steel pipe over the wood-block airway formerly used is more than sufficient to pay for the tunneling between the top of one permanent upcast winze and the bottom of the next, and that connecting the temporary winze with the permanent. There is another advan-

tage in this system—namely, that when it is completely established we have a second permanent way into depth from horizon 17 down.

It was difficult to determine the point at which the improved system should commence, but for various reasons No. 23 winze offers the best opportunity for an independent upcast airway, and consequently it has been decided that the new system should commence from this point.

The benefit of the proposed alteration in the ventilating system will not be felt on the blocks of mineral to be worked out from horizon 17 up, but from 17 down. Those of us who have been responsible for the reopening of this mine from surface to its present depth of 5826 ft. have had the opportunity of realizing the steady rise in temperature as the depth has increased and have been frequently reminded of the difficulties in store for us, especially at such times when an inadequate volume of ventilating air had been passing over the stopes or through explorations, caused by the partial closing of airways, the failure of fans, or by the explorations progressing more rapidly into depth than the main ventilating system. However, for many years it was possible to keep down to a reasonable figure the temperature to which the miners were subjected, and it appeared that by increasing the volume this condition could be maintained.

In the first place, natural ventilation was sufficient, later, furnaces had to be adopted during the hot season to assist the natural ventilation. As the mine became still deeper a Capel fan was installed at the top of the upcast "C" shaft to ensure a more constant volume of air. Finally, a Sirocco fan of large capacity was installed in place of the former, the output of which could be increased by additional power when required. Besides this, auxiliary fans are used on all explorations beyond the main system.

The existing ventilating system, which is referred to above as not satisfactory at the present depth, was forced upon us at a time when a more elaborate one of an entire independent airway from surface down, which naturally recommended itself, would have been too expensive. The former represented the cheapest means of ventilation, and until quite recently met the case satisfactorily. As depth has been attained the necessity for modification in the distribution of the air becomes imperative. The lode has so far shown no signs of failure in size or value in the lowest explorations. The prospects of this company being able to work it profitably to a great depth seem only to be limited by cost of winding, hauling, handling, mineral, and other engineering matters.

It was decided some years back to institute investigations with the object of obtaining information as to the increasing air and rock temperatures and add

to cost the deeper the mine is sunk. Bore holes were made, and the temperatures taken.

From the temperature readings we were able to construct a rock temperature grade as a guide to what we might expect in depth.

As before stated, without this rise in temperature from the rock and other causes, the probable running engineering expenses in working the mine down would not mean a very serious increase, and this has proved itself in practice as far as we have gone. Supposing the lode continues the same in size and value to horizon 20 (a vertical depth of 7626 ft.) it could be worked profitably to that point and even to a much greater depth, but from the grade on our temperature chart the rock at horizon 26 would be no less than 126.5° F. at the moment of opening.

We have, of late, realized from practice that the best we can now expect in the absence of artificial cooling would be a point where the efficiency of the men would be affected.

The temperature of the rock that had been laid open and exposed to the ventilation for some time year by year fell to some extent, but the deeper we went the cooling effect of the ventilating air would become less efficient, as we were year by year largely increasing the rock area; but beyond certain reasonable limits we could not increase the volume of the air, and consequently, unless the air could be artificially cooled on surface, advantage being taken of the operation to deprive it of some of its moisture, the possibility of working the mine to horizon 26 would be small, unless the working hours were reduced by the introduction of four shifts in the place of three. It was decided to make further efforts in obtaining more reliable information as regards this important question so as to arrive at the most economical and efficient means of reducing both the temperature and moisture of the atmosphere within the mine.

The increase of air temperature, due to the air becoming more dense as it passes down the mine, showed under normal conditions an increase in rock temperature of approximately 1° F. for every 180 ft., while the increase in rock temperature is approximately 1° F. for every 125 ft.

During the cold season an experiment was tried by night, when the temperature was considerably below the normal, in which a known volume of air was passed through a measured distance of the adit tunnel into the mine, the rock temperatures being taken throughout the distance of the tunnel and period of trial, and at the end of 5 hours it was interesting to find that a considerable fall in the rock temperature had taken place, and it would no doubt have continued to do so to some extent had it been possible to maintain a supply of cool air, but as the sun rose the air became warmer and the rock rose again to its original temperature.

The drying of the air has always been considered necessary in conjunction with the cooling operation, but its importance was not so fully understood until

information was gained from a valuable paper by Prof. John Cadman. Unfortunately, the drying of the atmosphere is somewhat antagonistic to a satisfactory solution of the dust question, which necessitates watering of the roads and stopes to keep down the dust. However, the proposed distribution of the air, previously referred to, will apparently do far more to overcome the dust trouble than the drying of the air will make against our efforts in this respect, as the allotted quantity of air, after passing one stope or at the outside two, will go directly with what dust it has taken up, to the upcast and away to surface, instead of the present system, in which the same air passes the bottom stopes, thence over the remaining stopes, with some slight addition of fresh air at each horizon, but accumulating dust all the way, until it finally reaches the highest stope, and thence goes to surface.

The actual necessities as regards cooling and drying to ensure that as greater depth was attained the miners would work in a perfectly healthy atmosphere (even more so than in the upper sections) having been appreciated, the next point to determine was where the operation of cooling and drying should take place. Some advice had been offered to the effect that it would be most advantageous underground, and it is true that some benefit would be derived from this; but the increase in mechanical appliances underground represents a serious obstacle to our particular form of mining operations, and, further, on account of our principal cooling agent (water) being found on surface in abundance, while underground there is very little, and that at a high temperature it has been decided that the cooling plant should undoubtedly be installed on surface.

Eric Davies, whose duty it has been to carry out the investigations, has also been entrusted with the designing of a plant which we consider most suitable for the purpose, and careful study has led to the proposing of this plant, not for extreme cooling or drying of the air, but one in which each operation will be performed to the most economical point, at the same time making use of ordinary cooling appliances which in practice have long since proved their reliability in cold storage, dry blast for furnace and other installations, and in consequence it represents a thoroughly practical scheme, which will effectually remove the one serious obstacle against the company being able to work the mine to a great depth. As regards the necessary power for driving the plant, this is not excessive, amounting to approximately 400 hp., and as to the provision of this power, with that of 200 hp. for ventilation, and other additions necessary for the working into depth, it has been satisfactorily arranged for.

The mine captain considers the efficiency of the miners is very little affected so far, and the writer is inclined to think that men who have been used to the damp, hot climate of Brazil for some years are probably more capable of working efficiently in 86° wet

bulb temperature than men in England accustomed to a damp, cold climate on surface. Often enough in the hot season here the change from surface to the bottom of the mine is only slight, but the change in England would, of course, be a far more severe trial. Even in the hottest places in the mine the contractors are eager to work 12 hours, and had it not been for our complying with this to some extent we should have lost our men. It is, however, evident that in spite of the apparent possibility that this climate is favorable to the efficiency of men working in hot mines, 8 hours is quite sufficient for steady workers at the present depth.

Anaconda's Many Improvements in Methods of Operation.

A summary of the many changes adopted in the methods of operation of the Anaconda Co. is embodied in a pamphlet recently published by Eugene Meyer & Co., New York. According to this pamphlet Anaconda is mining, reducing and marketing today at the rate of 330,000,000 lbs. of copper annually—approximately one-fourth of the copper produced in the United States, and one-seventh of the copper produced in the whole world; in addition, it is refining and selling the mined product of other companies, in some of which it has part ownership to the extent of 240,000,000 lbs.; thus making a grand total of 570,000,000 lbs. of copper—more than one-third of all the copper product of the United States and nearly one-fourth of the total copper production of the world—which it treats and markets.

Anaconda, besides its copper, is producing annually 13,000,000 ozs. of silver, 150,000 ozs. of gold; is smelting and refining at its custom plants an additional 4,000,000 ozs. of silver and 100,000,000 lbs. of lead; it will, within a few months, be producing at the rate of 70,000,000 lbs. per annum of high-profit zinc.

By end of 1916 Anaconda will be using 126,000 h.p. or 700,000,000 kilowatt hours annually.

Electrification has meant a saving of from \$3,500,000 to \$4,000,000 annually.

Prior to 1915 Anaconda found it impracticable to separate more than 82% of the copper in the ore. With slime flotation machines installed, the recovery of copper in concentrates has been increased to 96%.

The leaching plant in which tailings are treated has a capacity of more than 2000 tons per day and recovers about 85% of the metal content of the tailings. Its annual recovery amounts to 7,000,000 lbs. of copper at a cost of 8½ cts. per pound.

As the old tailing piles contain more than 20,000,000 tons, there is enough of this material available to enable the leaching plant to continue production at the present rate for nearly 30 years. These tailing piles are capable of being converted into 200,000,000 lbs. of copper.

Anaconda's new processes, summed up, have brought about a net recovery of more than 90% of the available metals in the ores as against a recovery of only 77% a year ago—without a penny of extra expense.

Not only have they made possible the recovery of this high percentage from the ores which are now being mined and which are to be mined; they have made possible, in addition, the recovery of the 13%—formerly considered impossible to extract—from practically all the ores which Anaconda has mined since the beginning.

They have made present reduction methods 17% more efficient; and have made available more than 230,000,000 lbs. of copper which under the old processes were thrown away.

By a new process made possible by cheap electric power and cheap sulphuric acid, Anaconda's metallurgists have found a way not only to extract high percentages of zinc economically, but also to recover the gold and silver values which occur in the zinc ores and either the lead or copper—whichever may prove more profitable.

It is a conservative assumption that Anaconda will in the near future, with normal prices of zinc, be able to earn a profit of 2 cts. per pound on its 70,000,000-lb. output—an annual net earning of \$1,400,000 from this new source.

These earnings should be in full effect in the year 1917, and there is an excellent outlook for much larger profits than this as the rate of operations increase.

All told, Anaconda will enjoy, under normal metal prices, an income from its security holdings of more than \$6,250,000 per annum.

Allowing for a probable decrease of production at Anaconda after the war, it appears reasonable to estimate about as follows:

Earnings in Montana—	
300,000,000 lbs. copper annually at cost of 9 cts. per lb., copper at 14 cts.....	\$15,000,000
70,000,000 lbs. of zinc annually at a cost of 3½ cts. per lb., zinc at 5½ cts.....	1,400,000
	\$16,400,000
Other income—	
Return from security holdings.....	\$ 6,250,000
Total	\$22,650,000
Per share	9.72

The company should within the next few years begin to realize on its investment in Chile. It is fair to assume a production of 100,000,000 to 150,000,000 lbs. of copper annually at a profit around 5 cts. per pound under normal metal prices. Anaconda owns 75% of the operating company in control of the Chilean deposits. They should return an amount equivalent to at least \$2 per share per annum on Anaconda's stock. The period when this return will commence is several years distant.

Excess of current assets over current liabilities on Dec. 31, 1915, was \$20,106,910. It is probable that the market value of copper and lead on hand at that date was around \$17,000,000 above the figures at which they were carried.

Spelter: Its Grades and Uses

By G. S. STONE.*

Spelter, like all commercial metal, contains impurities, but, unlike most other metals, none of these impurities are advantageous for any of the purposes for which it is used. The effects of these impurities on different products made from it vary greatly, hence the necessity for several grades differing in purity. Spelter is used for the following purposes, in quantities in the order mentioned: galvanizing, alloys, rolling, ornamental castings and miscellaneous uses.

For ordinary galvanizing the effects of the common impurities is not very great. Iron is objectionable as causing a loss in dross and in making the coating more brittle and liable to crack and peel off. Lead, up to the limit found in commercial spelter, has no serious effect, but is objectionable when present in large quantity, as it liquates in the bath and does not enter the coating and is, therefore, wasted. Lead is usually worth less than zinc and the purchaser does not wish to pay for it at zinc prices.

The four higher grades of spelter chiefly used for alloys and the specifications were principally made for the alloy makers and do not, in all cases, call for metal suitable for some of the other purposes for which it is used.

Aluminum.

In alloys, aluminum is frequently very injurious, 0.01 per cent in many cases making brass useless for the purposes for which it is intended. In the few instances where its presence is desired, it is more satisfactory to add it directly than as a constituent of the spelter. The specifications (as proposed for the American Society for Testing Materials in 1915), therefore, require that the four higher grades of spelter shall be entirely free from aluminum.

Iron.

Iron is always present in spelter, but is very undesirable in brass and similar alloys, making them harder and greatly increasing the hardness due to cold working. The increased hardness is very objectionable, causing a greater consumption of power and endangering the rolling mills and drawing presses.

Lead.

Lead is very objectionable in some alloys and essential in others, and the main variation in the different grades of spelter is in the allowable amount of lead. High-grade spelter, which is used for alloys that are to be subjected to the most severe spinning and drawing operations, can be rejected if it contains over 0.07% of lead, as lead reduces the ductility of brass.

Intermediate spelter, with a lead limit of 0.20% is used for alloys that do not have to undergo as severe treatment, and also very largely for alloys like manganese bronze that are used both cast and wrought.

Brass special has a lead limit of 0.60%, and is mainly used for brasses where the maximum ductility is not required. The lead and iron are limited to 0.60% and 0.03%, respectively, because brass made from such spelter is used for ordinary drawing, spinning and forming work where the requirements are not especially severe.

Selected spelter carrying the maximum 0.80% of lead and 0.04% iron is used by brass manufacturers for making alloys to which lead is added in order to secure free cutting qualities. Material of this kind is usually made into rods and heavy sheets for the manufacturing of small articles by turning, milling and drilling operations. Such brass must contain sufficient lead to reduce the strength of the material and cause the chips to break easily.

Owing to the fact that brass is usually made in crucibles in small quantities, uniformity in the spelter is of the greatest importance. As lead segregates badly, and more markedly the higher the proportion, the lead limit of the average sample is made low enough to allow for this tendency without injurious effect on the product. Even when the brass manufacturer adds lead, he does so in known amounts and thus obtains a uniform alloy from the different pots, which would not be possible if all the lead needed were contained in the spelter.

Cadmium.

There is very little doubt that cadmium in zinc is very injurious for some of the purposes for which it is used, as it renders it harder and much more brittle. There is, however, considerable difference of opinion as to how far these undesirable properties persist in alloys made from zinc containing cadmium. The majority of the brass makers are of the opinion that the high temperature of the brass pots cause so much of the cadmium to volatilize that the residual amount has very little deleterious effect.

There is no doubt that large amounts of cadmium, say 1 or 2%, make brass hard and brittle. We have no reliable information at present showing the effect of small amounts of cadmium on the alloys, and the evidence on this point is extremely conflicting.

Cadmium, together with lead, seems to intensify the effect of the latter and also causes the brass to become more sensitive to the effect of overheating in the various annealing operations to which the wrought material is subjected.

Very little spelter is made containing as much cadmium as is allowed for intermediate and brass special

*A portion of the report of the Committee on Non-Ferrous Metals and Alloys, American Society for Testing Materials, Atlantic City, N. J.

and the specifications, therefore, put practically no limit on cadmium except for high grade. Whatever the facts may be for alloys, it is certain that the amounts of cadmium allowed by the specifications are much greater than are permissible for other purposes for which zinc is used. The question of cadmium in the better grades is complicated by the fact that until the last year and a half practically all the high-grade and most of the intermediate spelter was made by one company from ores that are free from cadmium. The alloy makers have, therefore, had no extended experience with the effect of cadmium in the better grades of spelter, and during the last 18 months conditions have been so abnormal that it is difficult to draw conclusions.

High-grade spelter is very extensively used for galvanizing telegraph and telephone wires which are required to stand sharp bending when making the "line-man's splice"; as it has been found that if impure spelter is used, the coating cracks and peels off the joint. The only high-grade spelter that has been used for this purpose is entirely free from cadmium. Cadmium being the element most likely to cause this trouble, it is very doubtful whether metal containing as much as is allowed by the specifications (0.05%) would be suitable for this purpose.

For rolling, cadmium causes such severe cracking that metal containing much of it is not economical; but as practically all the zinc rolling mills produce their own spelter, this matter is within their own control and the specifications do not affect them.

For ornamental castings no spelter described by the specifications would be satisfactory. The high-grade is all right as far as lead and iron are concerned, but with the maximum cadmium allowed, it would be impossible to make castings of many of the common shapes.

Cracking Oil.

A new way of procuring gasoline from heavier oils has been patented by Alfred A. Wells of Montclair, N. J., and the patent (No. 1,187,874) assigned to the Ellis-Foster Co. Almost any type of petroleum oil may be treated in this apparatus, but kerosene or similar oil is preferably used, which may be fed into the apparatus without first vaporizing. The vaporization may be allowed to occur in the lower part of the apparatus but preferably the oil is not only vaporized, but is somewhat preheated to a point below the cracking point before it enters the metal bath. The temperature of the bath may be about 900 to 1000° F., but the temperature varies with the oil which is being treated.

In the decomposition which takes place in the latter, carbon is formed which floats to the surface and is either blown out of the apparatus or removed from the top of the bath. The particles carried over in the vapors are largely caught in a dust collector in which

the sulphide of lead is also collected when sulphur is present in the oil. The use of oils containing high percentages of sulphur is feasible with this apparatus as the sulphur is taken out quite effectively and the sulphide of lead may be collected and treated to recover the metal. Sulphur-containing Mexican or California oils may thus be used to advantage.

The oil or oil vapors are passed through a bath of molten metal which is maintained in agitation by mechanical stirrers, arranged so as to vigorously agitate the oil or vapors just on entry into the lead bath in order to prevent the formation of large particles of coke or coarse masses of tar and the like which cause difficulties in the operation of the apparatus.

The heating is applied internally by means of a burner, situated within the lead bath, of a character such that should the walls of the heating appliance give way, dangerous results would not occur. In the preferred form the heating appliance is of the surface combustion type and a mixture of oil vapors or gases

A NEW METHOD FOR CRACKING OIL.

resulting from the cracking operation or other suitable fuel is mixed with air and forced into a mass of refractory granular material contained in a tubular heating device situated in the metal bath. The waste gases from the cracking operation are used so that the whole apparatus operates as a unit and the residual gases which otherwise would be used more or less uneffectively or allowed to go to waste are employed usefully in the present process.

In the diagram, (3) is the lead bath, (8) the heating element, (15) is the outlet for the exhaust gases, which if desired may be by-passed through the heating coil as shown. The dust chamber and carbon collector is shown at (23). The condenser (25) has an outlet pipe at the bottom, through which the condensed material is carried to receiver (27).

The Yukon territory has a total area of 200,000 sq. miles. Of this, a district of less than 800 sq. miles has contributed to its gold production.

What the Mining Companies are Doing

U. S. Steel.

The United States Steel Corporation reports for the quarter ended June 30, 1916, showing total net earnings of \$81,126,048, after deducting all expenses incident to operation, including those for ordinary repairs and maintenance of plants and interest on bonds and fixed charges of subsidiary companies.

The statement for the quarter ended June 30 compares as follows:

	1916.	1915.	1914.
Net earnings	\$81,126,048	\$27,950,055	\$20,457,596
Sinking fund	9,745,826	6,031,013	5,646,170
Balance	71,380,222	21,919,042	14,811,426
U. S. Steel bonds.....	5,673,962	7,346,478	7,311,963
Balance	65,706,260	11,572,564	7,499,463
Preferred dividends	6,304,919	6,304,919	6,304,919
Balance	59,401,341	8,267,645	1,194,544
Common dividends	11,436,806		6,353,781
Surplus	47,964,535	8,267,645	*5,159,237
*Deficit.			

The United States Steel Corporation's income account for the 6 months ended June 30, compiled from the quarterly reports, compares as follows:

	1916.	1915.	1914.
Net earnings	\$141,839,672	\$40,407,864	\$38,451,977
Sinking fund	17,605,079	10,261,802	9,959,535
Balance	124,234,593	30,146,062	28,492,444
U. S. Steel bonds.....	13,915,461	14,658,440	14,623,926
Balance	111,219,132	15,487,622	13,868,519
Preferred dividends	12,609,838	12,609,828	12,609,838
Balance	98,609,294	2,877,784	1,258,681
Common dividends	17,790,587		12,707,562
Surplus	80,818,707	2,877,784	*11,448,881
*Deficit.			

After directors' meeting the following statement was issued: "Directors at meeting today authorized distribution of an extra dividend of 1% on the common stock. During the past quarter plants and properties of United States Steel were operated at maximum capacity. Both production and earnings exceeded those for any previous quarter. Its several subsidiary companies have many extensions and improvements under way calling for expenditure of a large sum of money. These improvements are mainly for purpose of diversifying products and increasing economic efficiency.

"Unfilled orders on hand at June 30, 1916, amounted to 9,640,458 tons, which will occupy the mills for several months. New business is coming in at a satisfactory rate, many contracts being entered for delivery of materials throughout 1917."

The preferred dividend is payable Aug. 30. Books close July 31, reopen Aug. 11. Common dividend is payable Sept. 29; books close Sept. 1, reopen Sept. 12.

Butte & Superior.

Butte & Superior's preliminary report for June on oil flotation plant compares as follows:

	Tons ore.	Costs per ton.	Zinc con- cen. tons.	Value per ton.
June	48,475	\$.....	10,820	\$.....
May	50,688	3.22	11,658	65.25
April	50,112	2.81	12,080	83.79
March	52,089	2.69	12,190	83.62
February	49,806	2.52	10,775	93.56
January	49,428	3.05	10,535	101.60
December, 1915.....	45,277	2.92	10,109	89.00
November	47,872	2.91	10,286	90.58
October	43,092	2.75	10,473	79.59
September	37,278	3.19	8,968	81.27
August	40,509	3.38	9,561	80.75
July	41,547	2.95	9,482	75.76

Utah Copper Co.

The present mill capacity of the Utah Copper Co appears to have been reached with the recent performance of an 18,000,000-lb. production in a single month. Some late improvements at both mine and mill plants may, under favorable conditions, result in a small increase. Eventually capacity will be brought up to better than 20,000,000 lbs. monthly. This increased yield will be made gradually—possibly within

a year. An interesting feature of recent big production—when 44,000 tons of ore were handled in a day—is that the company will now build up a big bin capacity which will permit storing ores during summer months for treatment during the winter when weather conditions interrupt a large ore extraction. In this manner Utah Copper will overcome the big winter's handicap in ore shortage and to some extent relieve the situation by drawing on its ore reserves in the bins. By this method the company should be able to build up its average yield of copper so that there will not be so great a difference between the winter and summer months' production. The average yield by this plan should be at least 15,000,000 lbs. a month with present capacity of plants.

Calumet & Hecla, Mich.

The Calumet & Hecla Mining Co. is slowly but surely reducing the indebtedness incurred when it purchased the Bigelow holdings of Tamarack, Osceola, Isle Royale, etc. Since Jan. 1 the company has purchased \$1,000,000 of its 4% notes, which leaves but \$1,764,000 outstanding of an original issue of \$8,500,000. This is the only capital liability to represent Calumet's \$20,000,000 investment in subsidiary company shares. The present market value of the parent company holdings is about \$20,000,000, so that deducting the outstanding notes the equity is \$18,250,000, or \$182 per share on Calumet & Hecla's 100,000 shares.

The following table shows the present market value of Calumet's holdings in sub-company shares, quotations for which are available. This totals \$18,465,000, but the inclusion of White Pine, Seneca and others should easily bring the total up to \$20,000,000.

Company.	Shares owned.	Market price.	Value.
Ahmeek	98,048	95	\$ 9,414,560
Allouez	41,000	65	2,665,000
Centennial	41,500	15	622,500
Isle Royale	32,910	27	888,570
La Salle	152,977	3	458,931
Osceola	32,750	87	2,849,250
Superior	50,100	15	751,500
Tamarack	19,400	42	814,800
Total			\$18,465,111

St. Joseph Lead Co.

The condensed general balance sheet of the St. Joseph Lead Co. as of Dec. 31, 1915, follows:

Assets—		
Land		\$ 6,732,053.01
Building and equipment.....		3,980,013.06
Investments		8,641,496.74
Working and trading assets.....		413,951.17
Current assets		721,307.60
Due from affiliated companies.....		31,380.65
Deferred assets		318,294.23
Total		\$20,838,496.40
Liabilities—		
Capital stock		\$14,094,660.00
M. R. & B. T. Ry. loan due.....		2,359,769.16
Current liabilities		213,612.76
Due affiliated companies.....		559,918.36
Reserves		349,260.60
Surplus		3,261,275.58
Total		\$20,838,496.40

United States Smelting.

June earnings of the United States Smelting Co. were not far from \$700,000, bringing total net for the second quarter of the year to about \$3,100,000. This makes no allowance for income from the Mexican properties during June, though these were in partial operation and undoubtedly on the right side of the ledger. It has been impossible, however, to obtain late figures from across the border.

Other important considerations must be taken to correctly appraise the earnings. United States Smelting Co., in accordance with its custom, carries its unsold metals at far below market value. Copper, for instance, is carried at 13

cts., silver at 50 cts., and so on. In the present era of big production this factor of inventorying is all-important.

Net profits of \$3,100,000 for the second quarter after providing all interest charges for the \$12,000,000 notes, and after depreciation and exploration reserves, are equivalent to nearly \$8 a share for the common. Adding in profits for the first quarter, the showing for the half year is equivalent to \$14 a share for the common, which compares with but \$2 paid out in dividends. If it were not for the Mexican ructions, Smelting would have earned its common dividend nine or ten times over.

Kennecott Control of Braden.

The Kennecott Copper Corporation has acquired through exchange of stock nearly 99% of the outstanding capital of the Braden Copper Mines Co., or 2,564,164 out of 2,590,506 shares.

With the maintenance of production from its Alaskan mines at the rate of 10,500,000 lbs. of copper monthly, Kennecott will not have to depend upon Braden for assistance in meeting present dividend requirements.

Braden has been milling of late an average of 4500 tons of ore daily. By the first of next March the tonnage should be increased to 6500 tons.

Operating costs at Braden have increased heavily. Coke, which formerly cost about \$9 a ton to land in Chile, has risen to between \$25 and \$30 a ton. This has been due in part to higher water freight rates.

During the first three months of this year the average cost of producing copper was 9.67 cts. a pound. In the year ended Aug. 31, 1915, it cost the company an average of 9.18 cts. a pound. There has been a further increase in costs since March last.

Net earnings for the 3 months ended March 31 were \$1,900,000, while estimates place net for the June 30 quarter at somewhat better than \$2,000,000.

The Braden mill, while it has secured at times an 82% extraction, has not maintained this figure as an average. The estimates of Pope Yeatman, the company's consulting engineer, have been based on an 80% recovery.

International Nickel.

Profits of the International Nickel Co. for the June 30 quarter were \$3,305,574. At mid-year the company was in an extremely strong cash position, with over \$4,000,000 in the treasury, call loans exceeding \$1,000,000 and receivables of more than \$2,000,000. Accounts payable and preferred dividend declared but not payable until August totaled less than \$2,000,000.

The consolidated general profit and loss statement for the June 30 quarter follows:

Gross earnings	\$3,959,135
Other income	66,262
Total income	4,025,396
Administration and general expenses	222,422
Net income	3,802,974
Depreciation and mineral exhaustion	497,400
Profits	3,305,574
Preferred dividends	133,689
Surplus*	3,171,885

*Equal to 7.58% on the \$41,838,600 common stock for the quarter, or at the rate of 30.32% per year.

The balance sheet of the company as of June 30, 1916, is as follows:

Assets—	
Property	\$43,679,368
Investments	1,510,034
Inventories	4,649,941
Accounts and bills receivable	2,246,387
Loans on call	1,015,000
Certificates of deposit	2,030,000
Cash	4,137,633
Total	\$59,268,364
Liabilities—	
Preferred stock	\$ 8,912,600
Common stock	41,834,600
Accounts	1,728,187
Preferred dividend payable	133,689
Accident and insurance funds	193,208
Previous surplus	3,294,195
Profit and loss surplus	3,171,885
Total	\$59,268,364

Miscellaneous Company Notes.

Wolverine Copper Co. produced 493,378 lbs. of copper which compares with 495,437 lbs. in May.

Mohawk Mining Co. produced 1,103,793 lbs. of copper in June as compared with 983,413 lbs. in May and 1,048,081 in April.

It cost the Miami Copper Co. 8¾ cts. a pound to produce 4,696,260 lbs. of copper in June, or practically the same as in preceding month.

The June production of the Mass Con. Mining Co. was 452,700 lbs. of refined copper and net profits were \$66,199. In the previous month production was 492,248 lbs. refined copper and profits \$66,225.

The Le Roi No. 2, Ltd., B. C., reports for May as follows: Josie mine—shipped 1515 tons ore; receipts from smelter, \$22,201, being payment for 1967 tons of ore shipped; umpires, \$1443; sundries, \$431; total, \$24,075. Estimated working cost—ore production—\$7800; capital expenditure, \$636; development including diamond drilling, \$3600; total \$4236.

In the 6 months ended June 1 Utah Metal & Tunnel Co. earned over \$600,000 net, or at the rate of nearly \$1 per share on the 677,000 shares outstanding. This was after unusually heavy expense for development. By July 1 the company should have close to \$1,300,000 cash and metals on hand. In the first 10 days of June the Bingham-New Haven property produced 1255 tons of milling ore, 105 tons of lead and 332 tons of copper smelting ore. Utah Metal department produced 746 tons of milling ore and 218 tons of copper ore which was shipped direct to the smelter. The company's mill during this period treated over 2000 tons of ore and produced about 900 tons of concentrates.

Another copper company which will soon enter the dividend-paying ranks is the Arizona Commercial. The company has accumulated a working capital of about \$500,000, which is ample for present and prospective needs. The earnings, therefore, which are now being realized are available for distribution to shareholders. Production is running from 350,000 to 450,000 lbs. of copper per month, and may be expected to remain around these figures until the new power plant is completed 3 months hence. An output of at least 500,000 lbs. per month will then be possible. On present production the company is earning from \$40,000 to \$50,000 per month, or at the rate of about \$2 per share per annum on the 260,000 shares outstanding.

Old Dominion's smelter output in June was about 3,800,000 lbs. of copper, a high record. Of this 3,000,000 lbs. represents the company's own output, the balance coming from United Verde Extension and Arizona Commercial. For the 6 months ended June 30 Old Dominion's production totaled 16,500,000 lbs. of copper. The full year is expected to show at least 35,000,000 lbs. Costs are somewhat higher than formerly, due to the increase in wages, but it is safe to say that Old Dominion laid its copper down in New York in the past 6 months at a cost of not much over 10¼ cts. per pound. On this basis earnings were close to \$2,700,000, or say \$9 per share on 300,000 shares outstanding. Dividends amounted to \$5.50 per share, or something over half the net.

The report of the Barnes-King Co. for June is regarded as very satisfactory in the placing of practically all the company's properties in a position to show substantial profits in the near future. North Moccasin mine was closed during the latter part of the month to permit the remodeling of the power plant purchased at the time the Kendall property was taken over last fall. The mill during the first 14 days of June treated 945 tons of ore. An incomplete clean-up netted \$7800; or an average of \$8.25 a ton, which was quite an improvement over the showing per ton in April and May. On July 1st the mine and mill resumed full operations. The August showing should be one of the best the company has ever made. All properties will be producing by that time. The final payment for the Kendall property will be made in September and the \$10,000 per month that has been paid on that account will be available for dividends.

**Record Dividend Disbursements Made
 by American Mines Works.**

July, 1915, was considered an unusually good month in point of dividend payments of American mines and works, 51 companies disbursing \$8,688,980. The month of July, 1916, made a much better record, however, for 56 companies looking to profits from American mining operations paid dividends totaling \$14,217,760. Added to dividends paid previously in 1916 brings the total for the year to \$152,733,255. Since incorporation these 56 companies have total disbursements to their credit totaling \$1,154,951,516. This is a return of \$269,549,655 in excess of the companies' outstanding capital.

The gold-silver-lead-zinc producers, according to reports made to Mining and Engineering World, made the largest total disbursements during the month, 43 in this class dividing \$7,349,006. Added to previous 1916 disbursements, in which 105 companies participated, makes a total so far this year of \$54,738,490 and to date \$320,711,083, on an issued capital of \$278,-789,693.

Of the above 43 companies 30 operate properties in the United States, which during the month just ended disbursed \$6,387,283, making a total so far this year (82 companies participating) of \$48,234,258 and to date \$247,649,557. Nine Canadian companies declared dividends amounting to \$924,496. For the 7 months of the year (20 contributing) disbursements total \$5,669,057, and to date \$64,581,522. But one Mexican company reports a dividend payment in July. During the 7 months of 1916 three companies paid dividends totaling \$35,175 and to date \$8,480,014.

Copper properties are credited with dividend payments in July amounting to \$5,857,396. During 1916, with 33 companies contributing, disbursements were made totaling \$56,326,737. To date these 33 companies have paid dividends amounting to \$627,234,429, on outstanding capital of \$328,609,078.

The companies operating metallurgical works paid dividends of \$991,358 in July. During the 7 months of 1916 six of these are credited with payments totaling \$13,347,424 and to date \$207,005,994.

Companies classified as securities-holding corporations paid dividends last month amounting to \$630,000. So far this year eight of them have disbursed \$28,320,-604. To date they are credited with having paid \$145,-771,718.

In the following table is listed the companies paying dividends in July, with the date of payment, amount per share and amount paid:

Company.	July.	Amount per share.	Amount paid.
Adventure Con., Mich.....	1	\$0.50	\$ 50,000
Ahmeek, Mich.....	10	3.00	600,000

and expensive mode of transportation for freight and ore, but, unfortunately, it is sometimes the only means available. In mountainous or hilly regions where mines are usually situated it is impossible to avoid grades, but in many cases grades can be eased by changing the route, and thereby save horses and time and increase the haulage capacity of the road. This applies equally as well to motor haulage, the present day tendency being to adopt the use of automobile trucks. But good roads are just as necessary to the automobile as to the horse, when efficient transport is desired.

There is no economy in leaving roads to take care of themselves. It is less expensive to keep a road in good condition—grading, smoothing over the rough places and picking off the stones—than it is to do heavy haulage over a road that has been neglected. Precautions must be taken to protect roads from washing during rainy weather, and where the ground becomes soft when wet the road should be of corduroy construction or well ballasted with rock so that the wheels of heavily-loaded wagons cannot cut in deeply.

In many cases the length of haul can be considerably shortened by changing the course. Many wagon roads follow old trails and are followed from habit, when the benefits to be gained by a change of route would more than balance the expense involved.

Usually wagon roads leading to mills, railroads, etc., are used by several mining companies, which can to their own benefit co-operate in keeping them in good repair.

Preparedness a Large Factor in Successful Mine Operation.

In connection with all mine work, whether strip-ping, underground work or large construction projects, which involve heavy excavation, the building of a dam, laying of pipe lines, erection of a power plant, etc., so much machinery and other mechanical equipment are now used that it is necessary to provide corresponding facilities for their maintenance and repair. For all such undertakings, delays are costly; hence, it is the better part of wisdom to avoid, as far as possible, any absolute breakdowns, to provide for necessary repairs or replacements as speedily as practicable, and to keep all of the equipment up to a high standard of working efficiency—the last named point being particularly important.

For this, a fairly large assortment of tools, such as will be found in a general shop doing plate work, machinery, forging and some wood-cutting and finishing is essential; and the field for the use of the modern shop tools, as well as the employment of skilled mechanics, has been correspondingly broadened.

More Attention Should be Given to Roadways for Mines.

Wagon roads over which ore must be hauled, connecting mines with mill, smelter or railway, are factors in mine operation that too often do not receive the care and attention that they deserve and that economy of operation dictates. Wagon haulage is a slow

Making Accurate Mill Tests.

It is no uncommon thing to hear those who have had unsatisfactory mill tests made direct suspicion towards someone, with the insinuation that all was not honest. This is wrong. Such a test should always be made under conditions that practically guarantee honesty on the part of all connected with it. The mine owner should regard it as due to himself as well as to those working for him to provide every safeguard against fraud or mistake by checks and personal supervision, the latter preferably by himself.

Watching and checking is no insult to the employed and will rarely be so regarded by an honest man. In the occasional case where it is so regarded, it is better to replace the man if necessary, for it is a wrong principle of business to consider any employe, however competent or valuable, as absolutely essential to one's success. The owner of the mine must himself know his business sufficiently well to judge what is best, for when he trusts his all to others he risks his all.

Nor does this imply a lack of faith in human nature; it is simply acting under the guidance of the logic of experience. Many jail cells are occupied by men who are above the average in faithfulness and honesty, but who were unable to resist temptations far greater than those to which the ordinary man is ever subjected.

PERSONAL.

H. Foster Bain has returned to London, England, from a trip to South Africa.

F. Lynwood Garrison, New York, has left on a mining mission to Brazil.

Thomas Graham, chief inspector of mines, British Columbia, is in Joplin, Mo.

C. F. Burt, of Yerrington, Nev., is revisiting the Michigan copper country for a few days.

E. Fleming L'Engle has accepted the position of general manager of the Royal Zinc Co., Joplin, Mo.

G. F. Dyer, superintendent of the Silver Pick Con. Co., Goldfield, Nev., has been in San Francisco, Cal.

E. H. Mead, general manager of the Cash Boy mine, Tonopah, Nev., has been in Salt Lake City, Utah.

H. J. Rabilly, mining engineer with the U. S. Bureau of Mines, is now with rescue car No. 5 in Butte, Mont.

W. D. Hole, formerly general manager of the Poderosa mines, Chile, has resigned and is now in London, England.

Harry Jennings, mine foreman at the Niggins mine, Bisbee, Ariz., has returned from a trip to Santa Monica, Cal.

F. J. Longworth, smelter superintendent of the British Columbia Copper Co., Greenwood, B. C., has been in Spokane, Wash.

Charles Donahue, mining engineer, Boston, Mass., is now in Globe, Ariz., relative to inspecting property in the Dripping Springs district.

Arthur Lakes, Jr., mining engineer, of Larson & Lakes, Spokane, Wash., has returned from a trip to Nelson, B. C., and Northport, Wash.

Fred H. Gartung, mining engineer for T. F. Lennan interests, Miami, Okla., has been in Chicago and will later go to Houghton and Detroit, Mich.

Floyd Weed, former manager of the McKane mine, Kirkland Lake, Ont., has left to assume a similar position in the iron fields of Birmingham, Ala.

J. V. Howell, assistant professor of geology at the Iowa State University, is in Leadville, Colo., continuing his inspection of the geology of the Lackawana district.

George J. Young has been appointed professor of metallurgy at the Colorado School of Mines. He was formerly professor of mining at the University of Minnesota.

James A. Barr, mining engineer with the International Agricultural Corporation, Mt. Pleasant, Tenn., is in Houghton, Mich., attending the Michigan College of Mines reunion.

R. E. Griggs, of the Transvaal Chamber of Mines, South Africa, is now in London, England, and will shortly leave for New York to arrange for shipment of mining supplies to the Rand.

Andrew C. Dawson, dean of the college of mining, University of California, has gone to Montana, where he will give professional testimony in several of the law cases now being tried in the state.

Van H. Manning, director of the Bureau of Mines, Washington, D. C., is now in Tucson, Ariz., relative to taking the final steps in starting the construction of an experimental station in that city.

Frank G. Boles, formerly manager of International Trade, published in Chicago by the Mining World Co., has been made vice-president of R. Martens & Co., New York, and will be in immediate charge of the affairs of the Russia Trade Corporation of America. This concern will specialize on all kinds of general merchandise and manufacturers are

invited to write concerning the possibilities for selling their products in this greatest of export trade fields.

M. H. Leonard, general manager, and J. C. Taylor, sales manager of the Denver Rock Drill Co., who have been visiting Edward Church, manager of the office at Houghton, Mich., returned to Denver, Colo., the 5th.

Eugene W. Richie has been appointed assistant to President Geo. E. Van Hagen of the Standard Forgings Co., Chicago. Mr. Richie returns to the latter company after two years in the sales department of the A. M. Castle Co., Chicago.

John W. Finch, mining engineer, Denver, Colo., has been engaged as general manager of the American syndicate which will exploit the mineral deposits of China. His headquarters will be Shanghai, China. He will leave this country Aug. 10.

Joseph W. Richards, professor of metallurgy Lehigh University and an official in both the American Electrochemical Society and American Institute of Mining Engineers, has been in Butte, Mont., on his way to San Francisco, Cal., and other Pacific coast cities.

John R. Champion, superintendent of the Yak. Mining, Milling & Tunnel Co., Leadville, Colo., has resigned and will retire from mining, having devoted 50 continuous years of his life to this vocation. The vacancy will be filled by Hugh C. Watson, formerly assistant superintendent.

S. W. Eccles, president of Nevada Con. Copper Co., visited the plants of the company at McGill and the mines at Ruth, near Ely, last week. General Manager C. B. Lakenan and Mill Superintendent Geo. C. Riser accompanied Eccles to Salt Lake City. Lakenan was recently elected a director of the company.

OBITUARY.

On July 8, 1916, Oscar Johnson, shift boss at the Ellamar mine, near Anchorage, Alaska, was killed. Johnson was working in the shaft when a descending skip hit a projecting, loose piece of timber causing the opposite end of the timber to strike him on the head.

Moris Davis, mining engineer and promoter, succumbed from the effects of cyanide poisoning in Chicago on Aug. 9, 1916. He was connected with the Royal Financial Corporation, Vancouver, B. C., and was in Chicago to dispose of his interests in a recent patent. While at the Congress hotel in company with his wife he took a drug into which he was unaware that cyanide of potassium had been sifted. Mr. Davis was born in Buffalo, N. Y.

Despondent because of financial and business difficulties, Phillip J. Eberhardt, 36 years old, of the firm of Harrington & Eberhardt, a member of the Spokane Stock Exchange, recently committed suicide in his apartments at the Spokane hotel. Eberhardt had been a resident of Spokane for about 6 years, having come there from Wallace, Ida., where he was employed by James A. Allen, now living in Spokane. For a short period during the oil boom in Alberta he was located in Calgary, where he represented his firm, then dealing extensively in oil stocks, but his brokerage activities were confined principally to Spokane and the surrounding camps.

SCHOOLS AND SOCIETIES.

American Institute of Chemical Engineers.—The 9th annual meeting of the institute will be held Jan. 10-13, 1917, at New York.

Colorado School of Mines.—The Board of Trustees has decided to hold the first annual Rocky Mountain Mine Rescue and First Aid Contest, at the campus in September. J.

C. Roberts, professor of safety engineering, is in charge of the arrangements for the contest and invitations will be sent Cripple Creek mining companies, inviting their attendance and participation. Entries are expected from Colorado, Utah, Wyoming, Montana, South Dakota, Arizona, New Mexico and possibly from California, Washington and Nevada. Only miners employed by the various companies will be eligible to compete. The rescue teams composed of students will be barred. The Rocky Mountain Coal Mining Institute and the Colorado Metal Miners' Association will donate cups, and it is expected the Cripple Creek District Mine Owners and Operators' Association will also. Manufacturers of the various mine safety devices will also probably offer prizes. The contests, which it is planned to make annual affairs, will it is expected serve to make the Colorado School of Mines, the center of safety engineering for the mining industry.

COMMUNICATIONS.

[This department is for the exchange of ideas bearing on all branches of the mining and metallurgical industries. Mining and Engineering World will not be responsible for the statements made nor opinions expressed by correspondents.—Ed.]

The Joseph Process for Treating Ores.

The Editor: I read an article in your paper stating that with a certain oil flotation process to extract gold, silver and copper from ore with creosote and pine oil, I believe it was, that the operator could extract those metals from ore carrying them for a cost of 8 cts. per ton, which seems very unreasonable to me, because creosote now commands a rather high price to treat railroad ties, even though it costs four times as much to treat ties as with the Joseph process, and is not even half as good for their treatment as my own method.

Also I cannot see how anyone can handle ores cheaper with creosote and pine oil in small tanks than he could in 500-ton tanks with the Joseph patented process, in using a small amount of sodium cyanide and ammonium carbonate with water; for the 500 tons of ore can quickly be filled into the tank by a gravity run, and delivered out of the tank into large cars underneath, with a Blaisdell excavator, and hauled away with locomotive to the dump ground for 2 cts. per ton, and dumped, after the ore is leached.

Neither oil nor creosote could possibly extract as much of the metals as the sodium cyanide and ammonium carbonate and water, which has extracted from some ores so much of the metals that not a trace could be assayed from the tailings by several attempts to do so. Therefore in handling large quantities of ore properly, everyone knows that it could be done cheaper than by small quantities. The Joseph process will extract the values from telluride ores, bismuth, arsenical, sulphurous, hard iron or soluble iron ores, which no other method will do, and cheaper than any oil method, and save more of the metals than any other method on low-grade ores known to me.

If the gentleman means that the labor will not exceed 8 cts. a ton to treat the ore with pine oil and creosote, I would say the labor to turn a crank to allow the fine ore to run by gravity from an ore bin into the 500-ton tank would not cost a tenth of a cent a ton, and only 2 cts. a ton to move the tailings into large self-dump cars under the tanks, and to be conveyed to the dump ground by a locomotive or a trolley line car and dumped, besides the creosote and oil used as the writer stated will certainly cost much more than the small amount of the sodium cyanide and the ammonium carbonate as named in the patented Joseph cyanide process. The metals can be precipitated therefrom with different strengths of electricity on to separate receptacles, or by any well known process. Thus as ores do not need to be roasted in order to obtain good extraction of their valuable metals such as gold, silver, nickel or copper, and as it could be used to extract more of the metals than any other method, and especially from the unroasted telluride ore, where a roasting heat of 335° would fume away out in the smoke nearly all of the telluride of gold, it does not take a prophet to say

that any oil method could equal the Joseph cyanide and ammonium carbonate process. Also if the operator who used our process at a royalty of 5 cts. a ton, and wanted to use compressed air aeration of the leaching ore, he could use our system of compressed air without any extra cost; whereas to roast base ore it would cost a few dozen times as much as our royalty, and waste several times as much more in fumes to roast a telluride of gold, and even then perhaps not save within several dollars per ton as much as the Joseph process.

I challenge anyone to produce a method that will beat the Joseph process, whether it be an oil or a creosote process or a smelting process, for cheapness and results of extraction of the gold, silver and copper from low-grade ores, either roasted or unroasted, base or oxidized, or ore that carries soluble iron, or sulphur, or arsenic, or bismuth.

DR. T. B. JOSEPH.

Goldfield, Nev.

NEW PUBLICATIONS.

Graphite in 1915. By Edson S. Bastin. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. 11:11; pp. 13.

This is the usual annual report gotten out on the production of graphite and general conditions of the market and prices. The United States is first reviewed as a whole and later the states are separately reviewed as regards their production. In the case of California the review is made by counties.

Manganese and Manganiferous Ores in 1915. By D. F. Hewett. Washington, D. C., U. S. Geological Survey. Min. Res. of U. S. 1:4; pp. 15.

Domestic deposits are reviewed by states and foreign deposits by countries. Separate reviews are made of manganese from different sources both as ore and secondarily from scrap metal and residues. Prices, production and the nature of the different kinds are given, and the conditions, prices and production of the manganese industry in general are gone over.

Strength of Webs of I-Beams and Girders. By H. F. Moore and W. M. Wilson. Urbana, Ill., University of Illinois. Bulletin 86; pp. 50; illustrated.

The results of the tests herein described are both tabulated, plotted into curves and discussed. The investigations and tests were made to show that the web of a beam does sometimes buckle contrary to the general theory used in designing and also that there are complex stresses at the junction of the web and flange. At certain points it is also brought out that there are crushing stresses in the web.

Annual Report of the Smithsonian Institute, 1915. Washington, D. C. Smithsonian Institute. Annual Report 1915; book; pp. 544; illustrated. For sale by Mining World Co. \$1.50.

The operations, expenditures and conditions of the Institute for the year ending June 30, 1915, are given. Articles included are of a wide variety and have been contributed to by 22 different authors. Practically none of the articles are of direct interest to the mining profession but as regards the advancement of science each article will be found exceedingly interesting to all.

The Technology of Marble Quarrying. By Oliver Bowles. Washington, D. C., U. S. Bureau of Mines. Bulletin 106; pp. 174; illustrated. For sale by Mining World Co. 40c.

The bulletin might well be termed a text book on the subject. It was the aim in publishing the bulletin to bring before operators and others interested a review of up-to-date practice in marble quarrying and to do this the best methods of different operators have been reviewed. Accounting is gone into as also is the structure of marble and its relation to the quarrying process. Waste caused by imperfections in the rock and the wrong methods of quarrying are spoken of.

TRADE PUBLICATIONS.

Flotation Oils. The United Naval Stores Co., New York. Circular; illustrated.

The circular is entitled "Flotation" and contains considerable information on the use and properties of different oils now employed in the flotation process. It brings out that wood-cresote oil is rapidly supplanting pine-oil which was formerly considered so favorably, the cause being that pine-oil has increased in price and wood-cresote gives nearly the same results. Other discussion is brought out to show that wood products will become more popular in the future because of its lesser cost.

Nordberg Poppet Valve Engines. Nordberg Mfg. Co., Milwaukee, Wis. Bulletin No. 28; pp. 35; illustrated.

An unusual number of illustrations and drawings of the assembled engine, its parts and plant installations are shown. The construction of this type of engine is described in a complete manner in connection with details regarding its theoretical and practical operation. Here details of practical cases are gone into. Curves and indicator cards are reproduced. For non-condensing operations a full-poppet design is recommended in the bulletin, while in condensing service the pottet-uniflow and poppet-corriss designs are stated as being most adaptable.

Drill Column Hoist. The Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo. Booklet; pp. 15; illustrated.

This hoist has been designed to allow of a rapid and temporary installation in winze and stope work where it would be far more costly to install a small permanent hoist and very inconvenient to do hand hoisting. The driving electric motor, gear connections and drum are one body and this is equipped with a clamp in the back to secure the hoist to the drill-post. Two models are described and illustrated. The regular size weighs 200 lbs. and will handle a load of 700 lbs. at the rate of 80 ft. per minute. A separate section is given to the listing of repair parts.

Cyaniding-Precipitating Machine. Eureka Agency, Denver, Colo. Booklet; pp. 7; illustrated.

This machine, known as the Eureka cyaniding-precipitating machine, is one in which the leaching, filtering, clarifying and precipitation are accomplished in one machine. The machine is a long trough divided into three compartments. The entire machine is made to revolve in a vertical plant about the horizontal axis of the cell-case or trough. This rotation serves to agitate the solution and ore in the first compartment which filters through to the second. Here the pregnant solution passes through a finer textured filtering material into the third compartment for precipitation with zinc. The machines are made in three sizes of 20-ton, 40-ton and 60-ton capacities. A laboratory machine is made which will give complete tests on the ore for the cyanide process.

Concentrating Machinery. Deister Machine Co., Fort Wayne, Ind. Bulletins, 1, 2, 3, 4 and 5; pp. 36; illustrated.

In Bulletin 1 Deister's Ideal head motion is described. This is furnished all of the company's reciprocating tables. Bulletin No. 2 takes up a double-deck sand concentrator. It is also made in single deck types. The machine will handle materials from 8 to 100 mesh. Drawings are reproduced showing the plan and elevation of both right and left-hand machines and accompanying these are working drawings for the foundations of each type. A list of repair parts is also given. Bulletin No. 3 is confined to the Deister Simplex rougher and finisher. Drawings, etc., are given identical with Bulletin No. 2. It will handle materials varying in size from 8 to 200 mesh at the rate of 50 to 250 tons per day. Bulletin No. 4 describes a multiple deck tilting slimer with 6 or 12 decks. It is adapted for handling material ranging from 200-mesh to the finest slimes and overflows. It is gotten up in a form similar to the preceding two bulletins. Bulletin No. 5 is on a cone baffle classifier. A sectional drawing of the machine is shown on the cover and the following two pages are description and discussion.

INDUSTRIAL AND TRADE NOTES.

The Hirsch Mine Lamp Co., of Philadelphia, has recently manufactured a new "Hirsch" portable electric lamp outfit of high candlepower, suitable for shaft digging and mine work. The lamps are made in two sizes, 6 volts with three cells 20 to 25 cp., weighing 10 lbs. complete and 10 volts with 5 large cells 35 to 40 cp., and weighs 26 lbs.

The Sullivan Machinery Company, 122 South Michigan avenue, Chicago, and Salisbury House, London, England, has established an agency in Holland with Petrie & Co., Heeren-gracht, 141-145 Amsterdam, as its special representatives. Petrie & Co. will sell the Sullivan air compressors, rock drills, hammer drills, diamond core drills, quarrying and coal mining machinery in the Netherlands. This new arrangement replaces the Sullivan Machinery Co. agency previously at The Hague.

Users of belting should be interested in literature that has just been issued by the Gandy Belting Co., Baltimore, Md. This company was founded by Maurice Gandy, inventor of the stitched cotton duck type of belting, and he has been manufacturing belts of this type for over 36 years. During this period it naturally gathered together some interesting information on belt service—and has presented it in a folder entitled "A Chain of Evidence." The Gandy Belting Co., 726-740 West Pratt St., Baltimore, Md., will be very glad to send anyone a copy of the circular.

The capital stock of the Morse Chain Co., Ithaca, N. Y., has been increased from \$400,000 to \$1,500,000 for expansive purposes in the shape of new buildings and additions to old ones already under way. The remarkable growth of this company is well illustrated by the successive building operations made necessary by the demand for its single product—Morse rocker-joint power transmission. From a fair sized factory at Trumansburg, N. Y., in 1904, about the time when electric motors came into broad commercial use, the business commenced to spurt, and in 1906 was removed to Ithaca to a new factory built specially for the purpose and twice as large as the former one. In 1912 it again became necessary to enlarge and the floor space was more than doubled. Present plants contemplate again doubling the size of the plants. A large storage building is about completed, additions to the steel and wire mills and a new gas producer building are well under way, and another addition to the main building, increasing its total length to more than 900 ft., is soon to be started. When these buildings are completed, the Morse Chain Co. will have a total floor space of approximately 7 acres, all of which will be devoted exclusively to the manufacture of Morse rocker-joint power transmission.

PATENTS RELATING TO MINING.

Coal Jig. Michael J. Gasper, Hazleton, Pa. (1,192,296; filed Mar. 25, 1916.)

Pumping Device for Oil Wells, Herman R. Williams, Mannington, W. Va. (1,192,145; filed Dec. 31, 1915.)

Amalgamator. Albert E. Vandercook, Alameda, Cal., assignor to California Macvan Co. (1,192,178; filed June 16, 1914.)

Process of Utilizing the Waste Products of Garnet-Works. John Davenport, Brighton, Mass. (1,192,394; filed Jan. 27, 1915.)

Guiding Device for Conveyer Belts. Samuel D. Sibley, Detroit, Mich., assignor, by mesne assignments, to Semet-Solvay Co., Solvay, N. Y. (1,192,128; filed June 24, 1915.)

Brick-Drier Car. Lachlan W. McArthur, Montreal West, Quebec, Canada; assignor to himself, and Percival Stafford McKergow, Westmount, Quebec, Canada. (1,192,082; filed Feb. 21, 1916.)

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Anchorage.

The Alaska Crow Creek Mining Co. is now operating at the head of Crow creek under Manager and President D. B. Dawson, who is employing about 40 men at present. A clean-up is about ready to be made and Dawson states that the company is now realizing from its hydraulic operations after 9 years of hard work.

Fred Laubner and William Bartholf have secured control of the Goodel-Fern property on Archangel, in the Willow Creek district. They are planning extensive development work this summer. The work will be done on the Archangel group. Indications are favorable, and they will probably put on more men as work advances.

Isaac brothers have made a strike on Reed creek in the Willow Creek district. The strike was made on the extension of the Mable mine and is 4 miles east of the Alaska, Free Gold and the Independence mines. They have 3 claims staked and have stripped the ledge for 200 ft. The rock shows free gold and pans good. Development is to be started immediately.

Juneau.

According to the figures of the local customs office copper valued at \$17,443,111 has been shipped from Alaska during the first half of 1916. This is very favorable and points to a considerably larger output than during 1915.

Bart L. Thane, manager of the Alaska Gastineau Co., states that June 26 broke the milling record of the company. Eighty-seven hundred tons of ore were treated in 24 hours. Since the beginning of the operation of the mill, the average cost of mining and milling the ore has been under 75 cts. per ton, which was the original estimate made. Eminent engineers freely predicted that the costs could not be reduced to 75 cts. For the past few months the cost has been 65 cts. and under. The mill is at present being operated at a 6000-ton capacity, which was our original estimate, but its actual capacity is more than double that amount. As the mine development to the east progresses the mill will gradually be speeded up. Owing to the contour of the ground and the lay of the ore body on the west end, we must take the ore from certain places first in order that the mine producing capacity will not be impaired. The ore on the west end was of lower value than estimated, but it is ore that must be taken out at once. In order to keep the milling average up it was necessary to reduce the milling capacity until the eastern stoping ground is opened. This work is now progressing rapidly and large bodies of ore of a higher value are being opened for stoping. Within a short time the mill will be running at capacity as we are able to take the ore from the east end and mix it with the west end ore, bringing the average value of the ore to the correct milling point.

Katalla.

The Tanana Valley railroad recently bought the property of the Alaska Oil & Refining Co. Falcon Julin, president, is prepared to begin immediate work on the wells and refining plants in order to increase the output, which is far below the local demands. In his opinion, he easily can double the present production.

The coal properties of the Alaska Petroleum & Coal Co. in the Bering River district are to be worked again after laying idle for 6 years. Manager Davis has returned from a trip to the properties and says: "With but 2 men we are taking out 10 tons of coal per day from the face of the tunnel in vein No. 1. This vein shows 10 ft. wide, solid anthracite, and is widening as we go in. We have a

depth of 500 ft. and the coal is clean and free from rock and shale. It is being burned in the tents in sibley stoves without a stove pipe, as it is practically smokeless. We have no dynamite on hand, our old stock being worthless. As soon as our supply arrives from Seattle, we will have three shifts of men at work on the cross-cut to pick up the No. 2 east vein—a 5-ft. vein of clean, hard coal with a depth of 400 ft. Supt. Hutchinson is preparing to enlarge the tunnel to standard size and fit it with a double track, as No. 1 vein will be driven 1000 ft. this year. The Alaska Anthracite Coal railroad is now into the property. We have 50 tons of coal ready to ship and at present coal in the vicinity is selling at \$30 per ton."

ARIZONA.

Jerome.

The shaft of the Dundee-Arizona is now down more than 300 ft. and sinking is being pushed at the rate of 5 ft. a day. James A. Hubbard is in charge of the development work. The Dundee, formerly known as the Greenflower, lies on the south side of the "hogback," and just at the eastern edge of Jerome, within a few hundred feet of the workings of the United Verde Extension. Between the two lies that part of the Jerome Verde that is under development. Only two claims are included in the Dundee property, but the surface indications are among the best in the district. Work on the property will go ahead rapidly. A blanket of carbonate ore over the property has already been developed and a zone of rich conglomerate ore has been encountered near the surface.

Machinery for the Venture Hill property has been shipped. Work on the property is going ahead under the direction of John Reilly. The report of the strike on the Pittsburg-Jerome property has encouraged work on the Venture Hill holdings.

Unwatering of the old Arkansas and Arizona shaft is progressing rapidly. Little trouble is being encountered, even though the machinery and equipment being used in the work has lain idle for a long time, until the property was recently taken over by the Goodrich-Lockhart syndicate. Until the workings are drained it will be impossible for any real mining or development to be done. Under the direction of Supt. Galligan, the force of 16 men has reached the 900 level and will soon have the shaft completely unwatered.

The shaft of the Jerome Verde is now enlarged to three compartments down to the 325 level. A bulkhead, installed at that point to catch the rock taken out above it in the enlarging operations, was torn out several days ago and the pump started once more. Another bulkhead will be placed at the 390 level and enlarging resumed.

A stringer of yellow sulphide has been opened in the main shaft on the Jerome-Portland property. Although only a stringer formation, a few inches wide, the ore runs very high, in fact it is declared to be almost solid copper. The shaft is being sunk by hand, pending the installation of machinery, which is already on the ground.

Prescott.

The Big Ledge Development Co. has taken over the Gopher group of patented claims, near McCabe, the Hackberry mines and the old Boggs smelter, near the Hackberry property. The purchase of the Gopher was brought about largely by the good showing of the Henrietta mine, adjoining it on the north, which is operated by the Big Ledge people. The old smelter is to be modernized and thoroughly overhauled for treating the product of all interests owned by the

purchasers. Both the Gopher and Hackberry properties are attractively rated in gold and copper.

Sinking of the shaft on the Loma Prieta property in Copper Basin is going ahead steadily. A continuous ore body has been determined for more than 55 ft., and with every foot of increased depth the showing improves. A carload of high-grade chalcopryrite ore has been shipped as a test from the Loma Prieta. All work at the mine is now under direction of John Livezey, who has taken up his residence at the camp.

Recent exploration in the old Senator mine has resulted in new and valuable ore being proven. In the zone where the Treadwell vein was penetrated a large tonnage was opened up, giving values of \$50 in gold and copper. The strike occurred at a point 2500 ft. in on the old tunnel. The Senator, one of the units of the Commercial Mining Co., was believed to have been worked out years ago. Another claim of the group, the Snoozer, is shipping daily to Douglas a large tonnage of high-grade copper.

Initial exploration movements on the McNulty-McBride properties, recently taken over under option by the Daly-Crawford-Levissohn syndicate, are under way. A. L. Johns of Globe has taken charge of the work, established a camp and is ready to go ahead with churn drilling as soon as one of the three drills to be used arrives. Three hundred acres of ground has been set aside for early exploration.

Throughout Yavapai many mines with which the public is not so familiar as with the larger producers, are doing good and making many improvements on their properties. Contracts have been let for the construction of six new buildings to accommodate a force of 50 miners at the camp of the Beehive Co., adjoining the Octave mine on the east. The Octave has made good during the last year and both mines will be operated during the coming year.

Operations on the Dolphin mines, on Turkey Creek, will be resumed in the near future, the owners having decided on a plan of rapid development after a recent inspection of underground conditions on the property.

A high-grade copper sulphide, carrying gold values, has been encountered in the old Bullwhacker mine. The property is now being developed to great depth, after having lain idle for many years.

Active work is under way on the project of the Arizona Deep Mining & Tunnelling Co. in the Bradshaws. The company plans to run a tunnel, approximately 17,000 ft. to explore six fissures in the mineral belt north of Crown King, in which are included the Lincoln, Nelson, Fairview, War Eagle, Gladiator, Crown King, Del Pasco and Wildflower groups. At certain points a depth of more than 1500 ft. will be given, and the exploration is declared to be the most extensive ever conducted in the southwest. The tunnel has been driven more than 50 ft. from the initial point selected by the engineers.

The first discovery of sheelite in this field was made several days ago in mines in the Hassayampa district owned by Louis Bernard, Valentine Allbarnd and John Barnard. A 3-in. streak of sheelite was cut on a 40-ft. crescent from the main tunnel and, when analyzed, was pronounced as of exceptionally high grade. The property is under development for its silver values.

Oatman.

During the past week two events have occurred, one of them being the peaceable solution of the labor difficulties which had occasioned the Gold Road mine of the U. S. Smelting & Refining Co. to close down temporarily, and another one a financial deal of magnitude whereby the control of the Carter Mining Co. passes to Keith & Keith of Boston within thirty days if the option taken by them and upon which a large cash payment was made, is exercised.

It is also reported that a deal involving a large sum of money is under way for the Oatman Queen property, and that either Keith & Keith or the United Eastern interests are the possible purchasers. It is known that extensive sampling of this property by engineers close to these two interests has been under way for some days. The Oatman Queen has opened a very fine and somewhat extensive showing of pay ore on one level, and on account of surface con-

ditions is regarded as a highly promising property. It lies in the same zone of ore channels as the Pioneer, Carter and Lucky Boy.

Officials of the Lucky Boy state that they expect to resume operations by Aug. 15, and the Oatman Queen expects to resume on or before that time.

The Big Jim is steadily blocking out ore in east and west drifts on the 400 and 485 levels, and it is officially stated that the average gold value for more than 300 ft. of ore exposure maintains a level well above \$20. The ore body is 30 or more feet in thickness.

At a depth of 200 ft. the Arizona Central, which lies between the United Eastern and the United Western, has cut 12 ft. of vein which gave average values of \$5.58. The quartz is similar in appearance to that in the pay shoots in the Tom Reed, United Eastern and Big Jim. The shaft will be continued to 500-ft. depth, and then the vein will be explored at that depth.

On the 400 level of the Pioneer 1500 ft. of lateral work has been done during the past 90 days, and has opened 600 ft. of new ore shoots, averaging \$15. The ore body is known to average better than 8 ft. in width where opened.

The Jerome Oatman shaft, at a depth of 360 ft., is running into a change of vein matter which is said by the operators to show good pan values, which seems to indicate the proximity of an ore body. Operations were temporarily checked by the burning of the compressor house 2 weeks ago, but work is now well under way again.

The new headframe of the United Eastern is now completed, and the hoist will soon be working on the new main shaft, which is down 375 ft. The headframe is 75 ft. in height. Foundations for the new mill are completed, and machinery equipment is arriving daily. Underground development continues to add largely to known ore reserves.

The plant of the Wrigley Exploration Co. has arrived and is being installed. It consists of a 75-hp. oil-burning engine and a 14x12 Ingersoll-Rand compressor and drill. The company is engaged in driving a tunnel from a low level into one of the main elevations of the Black Range mountains, to cut at depths ranging from 500 to 1200 ft. the series of veins which outcrop at surface. Not only will the property of the company be explored by this crosscut tunnel, but it may be used as a means through which adjacent properties will be developed at depth, and at the same time mines lying above will be afforded drainage. The project is an ambitious one, as it is planned to drive the bore at least 2000 ft.

Two 100-hp. marine-type, oil burning boilers, have just arrived in Oatman and are now being installed, one of them on the Lazy Boy and the other on the Esperanza. They will generate power to drive hoist, compressor and pumps. Work will soon be resumed on these two properties.

Supt. Keating, who has so successfully handled the development of the Big Jim, has also been given complete charge of the development of the Ivanhoe. Preparations are now being made to start drifting on a 6-ft. vein of highly-mineralized quartz which was cut on the 500 level, and which showed high-pan values, said to average around \$5. This vein is in the immense quartz-porphry dike which cuts through the andesites and the underlying sedimentaries, as is shown on the 500 level. The operators anticipate important developments soon.

CALIFORNIA.

Grass Valley.

The Brunswick Con. hoist has been provided with a new drum and is operating at full capacity. The new vertical shaft has been carried to a depth of 1200 ft. and some excellent ore is being mined. Forty stamps are dropping. The old shaft will be kept in repair for use in emergencies.

Buildings for the hoist and other machinery have been completed at the Allison Ranch mine, and installation of equipment will start early in September. By means of an ejector the water in shaft will be lowered 200 ft. before the

pumps are in position. Sampling of the huge dump is proceeding with good results, and it is believed a large tonnage of this material can be profitably milled.

Dedrick.

Control of the Globe gold mine has passed from the Globe Con. Mines Co. to H. M. Hall, the original owner, and steps have been taken to resume operations. Although the mine is stated to contain considerable ore of good character and is splendidly equipped, it failed to satisfy the operators. Under the management of the owner deep work will be pressed and a portion of the 20-stamp mill operated.

Columbia.

The Springfield Tunnel & Development Co. has acquired the Elliott property and will start developments shortly. A shaft is being sunk from the end of the 1200-ft. drift in the Ranch mine, where a large deposit of rich gravel was recently uncovered. It is planned to work this gravel while driving of the main tunnel is proceeding. The tunnel is now in 2800 ft. and will be driven about 2 miles further. As soon as it is completed a series of raises will be driven to facilitate mining of the various channels to advantage.

Redding.

The First National Copper Co., operating the Balaklala mine at Coram, has distributed a 25 ct. dividend, the first in its history. Shipments are going forward to the Mammoth smelter at the rate of 300 tons daily. A large amount of new development work has been recently performed with good results. The management has granted the employes the same wage scale that prevails at the Mammoth, Mountain Copper and other Shasta Belt mines.

The Gardella Dredging Co. has announced that its dredge at Lincoln will be moved to a point near Redding within a year. Two more dredges will be built in the near future. The original dredge has been operating several months, on land lying along Clear Creek and has won profits considerably in excess of values indicated by the drills. The success of this company has stimulated interest of other corporations in the local dredging field, and much explorative work is going on.

A strong company, represented locally by M. E. Dittmar, has taken a bond and lease on the Michigan group of copper claims on Bully Hill, and is preparing for extensive developments. The North Star, the principal claim, lies 600 ft. west of the Bully Hill mine, and is believed to contain the extension of the Rising Star ore body.

Sutter Creek.

Unwatering of the Old Eureka mine has attained a point 450 ft. deep. Three sinking pumps are in commission, and a fourth will be installed on the 600 level as soon as it is reached. Concrete foundations are being erected for the new electric hoist and steel headframe.

Sinking from the 3200 level of the Central Eureka has begun, and from the 3300 level drifts will be extended to intersect the vein which is yielding good ore at the 3200 point. Twenty stamps are dropping on quartz from the 2800, 3100, and 3200 levels, and 10 more will go into commission in a few days.

Amador City.

Cutting of a station on the 1800 level of the Keystone is going on, and from this point an east crosscut will be driven to the main ore body. Ore bodies of good width and fair values have been opened on the 1000, 1200, and 1400 levels, and 40 stamps are dropping constantly. In the first 6 months of 1916, 41,084 tons of ore were crushed, of a gross value of \$81,365. Total expenses approximated \$78,000.

Sierra City.

The Butte Saddle and Sacred Mound mines are being reopened by a strong company, with F. E. Barnett manager. Both mines have produced rich ore in the past and it is planned to press work on a broad scale. At the Cleveland 25 men are working and some good ore is exposed. The mine is controlled by the Gillespie interests of Pittsburgh, Pa.

Groveland.

A Tonopah syndicate, including Arthur Brown, Gurley Jones and J. H. Skelton, has taken over the Cosmopolite gold mine, about a half-mile from Groveland. The property

embraces 7 claims and millsite, and is equipped with a 5-stamp mill, compressor and other machinery. A large tonnage of fair-grade ore is blocked out above the main tunnel, and it is proposed to install a ball mill and other equipment, designed to increase the capacity of the mill to 50 tons per day.

Ophir.

The Mowitza, Enterprise, Good Friday, Green, Cornucopia and West Friday claims have been taken under lease and option by the Globe Con. Leasing Co., understood to be a subsidiary of the Crown Reserve Co., of Cobalt. Under direction of Supt. Burnett a Cameron pump, compressor, electric hoist and other machinery have been installed, and sinking is proceeding rapidly. At a depth of 300 ft. drifts will be sent out to intersect the Friday vein. The claims contain several veins carrying copper and gold, with copper predominating.

COLORADO.

Cripple Creek.

The ore shoot as exposed at the 1400-ft. level of Dillon shaft is now 550 ft. in. The 1600-ft. level, where the deeper continuation of the shoot shows, has recently been enlarged. The June production from this estate, comprising the Upper Granite, Monument, Dillon, Dead Pine and Coin mines was about 4000 tons. The company shipments from the Dillon mine are now holding at better than 2 cars daily. Bach & Co. on the Lower Dead Pine are mining a good average grade of ore, and a second set of lessees operating through the Dead Pine shaft are also producing. Carn-duff & Duncan operating through the Coin shaft continue to make steady production from the Dead Pine. Williams Brothers lessees on the Monument are shipping, and four sets of lessees on the Upper Granite mine are producing.

The Vindicator Con. in a letter to stockholders by President A. J. Zang says: "The operations of the second quarter of the year were characterized by extensive development, largely in preparing the Middle vein system of the Vindicator mine for stoping. This ore body has now been opened from the 18th level up to the 12th level, disclosing an immense volume of ore of better than average grade. Only a small portion of the work necessary to open the 19th and 20th levels of the Golden Cycle mine has been accomplished. The outline of the work planned extends well into 1917. Our engineering staff report that the flotation plant being erected below the Golden Cycle ore house will be completed about Sept. 1, and the results there obtained will govern the future policy of the company with respect to the handling of low-grade ores used in filling the stopes from the beginning of the development of the property. A lessened production during the second quarter over that of the first quarter was made necessary by the development referred to above. The tonnage shipped on company account was 14,877 tons, and that of the lessees was 16,276 tons. The net earnings for the quarter amounted to \$185,000, making the total for the half year \$410,000."

Leadville.

Reports of the district for the first half of 1916 apparently show favorably as regards operations in the district. To the end of June 402,250 tons of ore have been extracted from the mines in Lake county. Of this output, June showed the largest tonnage, with 82,250 tons, an average daily production of 2742 tons. May gave 73,000 tons, April 66,000, March 63,000, February 57,000 and January 61,000. The average daily output during the period was 2210 tons. It is conservatively estimated that the average gross value of the ore produced in the district is \$25 a ton. At this figure the district has produced \$10,056,250 for 6 months. In 1915 the total output for the year was 532,217 tons, with a value of \$15,895,229.99. Comparing these figures, which were considered a high mark last year, with the record made during the past 6 months gives an idea of what the totals are to be when added up for Jan. 1, 1917. During the past 6 months 29 old properties have resumed activity. Among these are several large mines that have been taken

over by important mining companies, including the Harvard and surrounding territory controlled by the United States Smelting, Refining & Exploration Co., the Mikado and an extensive tract now under the management of G. O. Argall; the McCormick recently purchased by the Empire Zinc Co., with the Robert Emmett and other properties; the Greenback owned by Patrick Mulrooney; the Home Extension in the Down Town section now producing a heavy tonnage of ore; and the Tarsus lease on Yankee hill where a rich strike has been made. The other properties that have resumed activities since the first of the year are scattered, and indicate the scope of an uplift in mining.

Boulder.

That there still is something else in the county besides tungsten was noted by a recent strike of gold at the Livingston mine. It is sylvanite-tellurium and is found in a winze from the 400 to the 500 level. The strike was made on a vein which is thought to be the Potato Patch vein which yielded such large returns from the surface to the 120-ft. level. The winze is being sunk on the Nyanza vein close to the intersection with the Livingston vein. The ore body is being followed and has now been opened to the width of the winze. At the present time the ore is not being worked except as they come in contact with it in the winze, which simply taps the edge of the body. The ore has been separated into two classes and the metal taken from the lower classes, which has not yet been shipped, will be clear, as sinking operations have been paid from the high-grade taken out. The shaft goes down along side a fault, fissure vein which carries much water. For this reason the winze on the Nyanza is being sunk off the fissure to avoid pumping. The winze is down 50 ft. and will be down 150 ft. when completed. This will come on the 500-ft. level. As soon as the winze is finished the shaft will be worked back up to the 400-ft. level. As soon as the 500 level is reached and dead work completed, the company will sink to the 600 level by the same system used in going to the 500. Work to the 600 will be finished by Jan. 1, 1917. This winze is being sunk by an air hoist and will continue this way till the 500 level is reached and the timbering finished. Two 50-gpm pumps are now keeping the mine dry and auxiliary pumps will be installed on the 400 and 500 levels to aid in this work later.

IDAHO.

Wallace.

That the Interstate-Callahan Mining Co. will be able to earn in excess of \$1,000,000 net, annually, with metals at the average prices that prevailed during the 10 years preceding the outbreak of the European war, is announced by officials of the company in their statement to the New York stock exchange, where the issue was listed recently. These prices, according to this report, were 4.548 cts. for lead, 5.6775 cts. for zinc and 57.844 cts. for silver. For the purpose of arriving at an approximation of earnings at these prices the output of the mine for May is taken as a basis, the production of the company for that month having been practically the same as that for several preceding months. The May output is given as 6000 dry tons of 49½% zinc ore and concentrates and 500 dry tons of silver-lead ore and concentrates, containing 50% lead and 20 ozs. silver. Under the terms of the long contracts for the treatment of its output, which takes effect in September at the prices above named, the zinc product would be worth \$34.29 a ton, or \$205,740, less a freight charge of \$63,150, leaving a net of \$142,590. The lead product on the same basis would be worth net, that is, with freight and treatment charges deducted, \$27.47 a ton, or \$13,735. This would make the total income \$156,325. From this sum are deducted production costs of \$9 a ton, \$61,578, and \$4000 for overhead expenses, making the net profit for the month \$90,747 and for the year \$1,088,964. To this is added \$72,000 for estimated profit during the year of the flotation plant, stated at 400 tons a month, worth \$15, making the total net income for a year \$1,160,964, or enough to pay dividends of \$2.50 a share of issued capital stock.

LAKE SUPERIOR.

COPPER.

Houghton.

Superior & Boston should arrive at the 14th level with its shaft about the middle of September and then a crosscut will be driven to the vein. A fine quality of ore is being taken from the Arizona Commercial, the next property west, and the Iron Cap still further in the same direction is earning from \$30,000 to \$40,000 monthly. These properties all had the same poor showing as the Superior & Boston at the same levels, and are making their success on the levels that the former is sinking to reach. It took quite a time to underwater the shaft and workings from the 8th to the 12th level, new pumps being installed for the purpose. The quantity of ore taken from the 6th and 8th levels is being increased steadily. Supt. Graham as the leases expire, has been working the ground and the company is doing all the work with quite a financial gain.

Keweenaw has called another assessment payable Sept. 2, of record Aug 12, and later the subsidiary, the Phoenix, 99½% of whose stock is owned by the Keweenaw, will assess so as to transfer the necessary portion of the money thus raised. The management is drifting on the 6th, 7th, 8th and 10th, 12th and 14th levels east to the footwall, and is finding a very good average of shot copper amygdaloid. On the 4th level the small diamond drill as found, when this drift was first extended two or three years ago in barren ground, that it proceeded between the two mineralized parts of the lode, that lying along the hanging-wall side and that along the footwall, both well mineralized, as is now met with every where either side has been developed. It will be recalled that the lode averages about 82 ft. in width perpendicular to its walls, and that horizontally it will average about 165 ft., there being a barren spot between the two mineralized stretches. This confirmation of the belief that the mineralization persists generally, as previously found, in two portions with the better grades in the footwall, assures the mine of a profitable future, if the mill test which will be begun some time this month, turns out as well as there is every reason to believe it will.

Isle Royale is averaging about 2900 tons daily and runs its own mill every Sunday from 7 p. m. to Monday 7 a. m.; and this record is being steadily held notwithstanding that from 1500 to 1700 ft. of new ground is being opened every month. The present policy will, when No. 7 shaft is completed, and No. 1's repairs are ended, and one or two new shafts are sunk to the south, make this mine one of the largest producers in this copper district.

New Arcadian has its new shaft holed from the surface down 50 ft. on the lode, which may be the Old Arcadian encountered by a crosscut 265 ft. west of the shaft located 1800 ft. south of principal shaft. This shaft will have the advantage of the latter, as it is in the lode and the cost of cutting a 150-ft. crosscut and the haulage there will be saved. A little drifting is being done to connect the crosscut with the new shaft and the same quality of abundant coarse stamp copper is appearing. The 900 level north has just reached the New Baltic and had met with for the last few weeks as good ground as has been cut through in any part of the mine.

Calumet & Hecla's daily tonnage is averaging about 10,200, or about 200 tons short, due to the scarcity of labor. The new furnace at Dollar Bay, and that at Lake Linden are nearing completion, and will go into active operation in a very short time; they will give an increase of about 8,000,000 lbs. annually.

Victoria produced 105 tons mineral for July as compared with 102 for June. The rails have been laid in the new skipway down to the 19th level, but they will soon be continued to the bottom, the 26th level, as the last dirt was taken out the 3d. The small hoist good for 1000 ft., or so used in the upper part of the new skipway has aided in the production which is sufficient to pay for all these construction expenses as they occur and still carry a good balance. On the west side of the shaft where for some time there

has been no copper of commercial values, rich grades have been passed through for the past week, with every promise of continuing, and the eastern drift is still in excellent showing. There is ahead large areas of good stoping ground and when the new hoisting engine is ready the daily tonnage will steadily increase.

Houghton Copper, up to the 2nd, had a stretch of 20 ft. of good grades in the vein encountered 120 ft. west of the Superior lode on the 12th level, and which at first did not resemble the West vein of the Superior mine, but as soon as the copper appeared the color and general character of the rock changed rapidly, and disclosed the well-known characteristics of that vein so prominently as to dispel doubt. The north drift on the bottom of the winze, the 12th level, has now a length of 70 ft., and is continuing in good grades, which, together with the good reaches met with in the winze, augurs well for the future of the Superior lode at this mine.

Lake Milling, Smelting & Refining Co. has, at its No. 2 mill, formerly the Tamarack No. 2 or "little Tamarack," the steel up for the northern addition, and the foundations laid for the southern. Each of the additions will be equipped with a Nordberg stamp and the most up-to-date system of "wash," thus doubling the present capacity of the mill. The additions will be ready some time in the spring and will be able to stamp the rock of the Allouez that now goes to the Centennial-Allouez at Point Mills, about 7 miles distant, thereby effecting quite a saving in transportation. One of the two stamps now in operation here mills the Centennial rock and the other stamps about 600 tons daily of the Allouez.

Osceola's tonnage for July will be about 105,000 as compared with 114,000 for June. This decrease is due mostly to the scarcity of trammers.

Franklin is on all of its southern drifts continuing to run into very rich stretches, and the week ending July 29 on the 28th level, was unable to make more than 15 ft., as compared with the usual 24, owing to the great amount of copper that made the drilling very difficult. These stretches have been quite numerous from a point about 400 ft. south of the shaft, and this 400 ft. was richer than the average of the northern ground; they are gradually raising the yield of refined copper. There is still a little good rock coming from the Pewabic or Quincy amygdaloid.

Cass is down about 900 ft. with its drill on the Malden property near the Norwich, and is finding mostly trap and sandstones. It was expected that a conglomerate, that has a good outcrop some distance away, would be found in the first 200 ft., but evidently it was missed by a few feet. The strike of the Forrest lode on which is located the Victoria mine, has not yet been sought. In a short time there will be another drill in commission and the ground will be thoroughly explored before the winter sets in.

Indiana has been delayed in getting new men and has not yet begun the new shaft on the Butler lode, but will have them soon and start to break the ground.

Ahmeek has received the "bull" jigs for the eighth stamp, but has not yet been sent the smaller ones. Nothing is being lost, however, as there is not now enough rock coming to keep the seventh stamp busy all the time. The company has bought 20 and the Calumet & Hecla 2 of the Dreadnought type of drills from the Denver Rock Drill Co. The purchase was the result of thorough tests that had been made at the Ahmeek.

IRON.

Ishpeming.

At the North Lake mines, owned and operated by the Cleveland-Cliffs Co., ore is being taken from the new open pit with steam shovels under contract with House & Person. The overburden was also removed by them and averaged be taken out next year by this method. The company is 30 ft. deep. The depth of the ore body has not been tested, but its surface dimensions are 400 ft. by 100 ft. The ore remaining in the pit after the end of a steam shovel work will be trammed through a drift to the Lloyd shaft, and hoisted. The distance between the open pit property and the Lloyd mine is 2000 ft. Open pit mining can be continued throughout this season, and it is possible that some ore can

employing a larger force than at any previous time. There has been no shortage of labor and all men who can be employed are on the pay roll. All houses recently constructed are now occupied. When navigation opened the stock piles at the underground mines were exceptionally large. It is not anticipated that all of the ore can be shipped this season, due to limited transportation. The company is going further than to simply open a mine. Edwin Cotter, in charge of landscape work for the company, is at the North Lake with Warren Manning, Boston, Mass., landscape artist. Much is intended to be done towards beautifying the location with shrubbery, etc.

Ironwood.

At the East Norrie mine the old "B" shaft will be abandoned in the middle part of 1917. About 700 ft. from it the new "C" shaft is going down and will replace "B" when completed. It is 11 ft. 4 in. by 20 ft. 8 in., is steel timbered, 8-in. H sections being used. The shaft is being concreted with concrete slabs manufactured at the shaft. The slabs are 6 and 8 ins. wide and 3 ins. thick, each set is numbered and two men make from 86 to 90 per day. Concrete rests in molds for 24 hours and is then piled to dry. Sets have 5-ft. centers including the steel. The shaft is now down about 1350 ft. and is on an incline of 64°. It will be electrically equipped throughout. A raise of 450 ft. has holed into the shaft and has been trimmed down to shaft size. The new shaft will permit the mining of a pillar of ore, containing about 1,500,000 tons, that has been supporting the old opening. The old "C" is located on the North Norrie property 1100 ft. north of the new "C," is in the hanging wall and to a depth, vertically of 1270 ft. All the original shafts in this section were in the hanging wall and held up ore as hanging wall openings do.

MISSOURI-KANSAS.

Joplin, Mo.

The Culbert Lead & Zinc Co. has purchased the mine and lease of the Henderson Lead & Zinc Co. at Four Corners, northwest of Joplin. On the lease purchased there is a 150-ton concentrator recently completed. The ground is just now being opened up, a number of prospect drill holes having been sunk for tests. This is the second property to be taken over by this company, which opened up an ore deposit on the land of the Missouri Lead & Zinc Co. southeast of Joplin, where a new mill is being erected. Those interested in the company are A. E. Culbert and E. J. Carter of Freemont, O., and W. S. Pate of Joplin.

In the Chitwood camp the St. Regis Mining Co. is completing a 300-ton mill on virgin territory. The ground has been opened at the 180 level, at which point the formation of disseminated sheet ground has been encountered. This will be a modern steam plant and designed to handle 300 tons per shift of 10 hours. E. R. McClelland is the owner.

Taylor-Marr & Co. are opening up a good prospect on the Chas. W. Edwards land north of Joplin. The ore extends from the 90 level to 120. The ground has been well drilled out, and the production now being made has verified the early prospecting. This is the second property to be opened on this tract in the past year.

The A. W. C. Mines west of Joplin has been compelled to close down their four properties because of lack of water for milling purposes. The ground in this part of the district is very dry. Not nearly enough ground water is supplied to keep the mills running and it is necessary to impound water in ponds during the rainy season. The drought extending over a period of the last 7 weeks has caused a dearth of water in this part of the field. If it continues many more mines in the same field will be compelled to shut down.

J. C. Vaughn of Joplin, has opened what he considers one of the richest strikes southwest of Joplin that has been made for a number of years. On a lease on which three shafts have been put down, very rich ore has been found at comparatively shallow levels. The ore being hoisted is said to run from 10 to 25% zinc, and for the present is being cleaned on hand jigs. The company is contemplating

the erection of a small mill. The strike was made on the land of the Empire Zinc Co., where a number of years ago some very rich strikes were made. Associated with Vaughn are W. H. Beal of Ft. Scott, Kan., Edwin Perkins and W. R. Baker of Joplin.

Chas. W. Edwards & Co. have taken over the Fighting Wolf mine at Bellville. Within another two weeks it is expected the production will be back to its old level. The mine is located on the land of the Royal Mining Co., whose local representative is Fleming S. L'Engle.

Webb City, Mo.

Wampler & Co., operating on a lease of the Hackett land south of Duenweg, have started the third shaft in an effort to get down to ore deposits which have been thoroughly developed by drilling. The company had already lost two shafts owing to the running character of the ground. The first shaft was 25 ft. deep and the second 80. The new shaft has been started on a portion of the lease in which it is believed nothing but hard ground will be encountered.

On the same tract Ihlseng & Co. are sinking a new shaft in an effort to open up a run of ore at the same level as that developed on the Wampler. The shaft is now down 35 ft. and the company is installing steam equipment to complete the sinking of the shaft. The drilling of this lease is considered nearly as good as that of the Wampler tract.

J. W. Winter and associates are starting a drilling campaign on adjoining ground and will endeavor to trace the run of ore opened up on the above leases to adjacent ground.

In the same vicinity the Greenhorn Mining Co. has opened up a good strike of ore according to the reports of the drill men

At Wentworth east of Webb City, a company of Granby and Pierce City men are erecting a new plant on the old Mollie Gibson lease east of that city. The company has developed the ore in four different shafts and will have a large tonnage ready for the mill. The new plant will be able to handle from 250 to 300 tons per day.

Galena, Kas.

George McCullagh has started in on a drilling campaign on the old New York Zinc Co. tract at Galena, and in the first hole put down encountered 15 ft. of ore at the 250 level, from which assays show 30% zinc. The strike is so rich as to encourage the further development of the ore at these levels and a number of other holes will be put down. The ore discovered is underneath the old workings, which many years ago was considered one of the richest in the district. The extension of the ore to deeper levels was anticipated and hence the deeper drilling.

MONTANA.

Butte.

The zinc plant at Great Falls is very nearly completed and will be ready to start operations in 2 weeks. The zinc concentrator in Anaconda will be ready then to furnish product for the electrolytic plant to treat. These plants were started in September and have been completed before the time promised by the engineers in charge of their construction.

The Montana Power Co. is pushing work on the development at the Holter dam and will also add several units to the Rainbow development this year. The capacity of the plants will be increased to utilize the flow, which is now augmented by the reservoirs, which have been constructed by the company during the past few years.

During the month Butte will entertain several prominent eastern citizens. They will accompany a party piloted by John D. Ryan. Among them will be W. E. Corey, formerly president of the U. S. Steel Corporation and a director of the International Smelting & Refining Co.; R. L. Agassiz, vice-president of the Calumet & Hecla and prominent in several other large copper companies, and Charles H. Sabin, a director of the International Smelting & Refining Co. and connected with the leading copper companies. They left New York last week and are now in Northern Michigan,

where they are making a trip of inspection. From there they will go west and expect to remain in Montana until the new zinc electrolytic refinery at Great Falls is ready to start, about Sept. 1. They will also visit the different plants of the Montana Power Co. and spend a short time hunting and fishing in the upper Madison district. In addition to this party, another visit is expected either in August or September from D. C. Jackling, general manager and managing director of the Butte & Superior and Utah Copper companies, together with a number of men prominent in the Jackling properties.

Work has been resumed on the Butte & Bacorn property after a shut down of about 10 years. The buildings are being repaired and put into good condition, the bunkhouse and boarding house remodeled and made up to date in every particular and the shaft put into shape for operation. There will be some repairing to be done at the collar and a new headframe 70 ft. high, with 18 by 18 timbers, will be installed at the Calumet shaft. In order to avoid delay in running electric power to the mine, a steam equipment will be installed. This has already been ordered and it is expected to have the surface working all in shape so that the unwatering of the shaft can begin within 6 weeks. Conditions at the property are very favorable for rapid work. As soon as the Calumet shaft is unwatered the work of sinking from the 1000 level, the present depth of the Calumet, will begin and be carried on down to the 1500. The showing made in this development work will be the most important of its kind in that section, as it will be the deepest shaft north of the Butte & Superior. The company, under the reorganized form, will be known as the Great Butte Copper Mining Co. Some \$264,000 was raised and all the indebtedness of the Butte & Bacorn was paid off. There is about \$180,000 available for carrying on the new development work, and the plans are to make a thorough exploration at depth of the 278 acres of ground owned by the company through the two shafts already down. All the necessary transfers have been made by which 400,000 shares of Butte & Bacorn stock were exchanged for a like amount of Great Butte stock. A number of prominent Pittsburgh and New York mining men are interested in the enterprise and ample capital is assured to carry forward the proposed development of the property. Surface indications point to some splendid possibilities and the management expects that when crosscutting is carried on in the lower levels a mining property with as fine bodies of ore as ever were opened in Butte will be shown.

President D. K. McDonald of Brooklyn mine has decided to enlarge the mill by adding one Wellman-Seaver-Morgan chilian mill, giving a tonnage of 550 daily. The development of the mine is going ahead steadily; 240 ft. of drifting has been done opening up one drift showing 6 ft. of high-grade ore; a drift off the main tunnel of 40 ft. shows 7 ft. of ore; from a winze sunk in main tunnel has opened up a fine showing of ore. Late assays show silver, 26.34 ozs.; zinc, 3.4%; copper, 9.8%. Another assay shows silver, 33.44 ozs.; zinc, 1.8%; copper, 2.6%.

NEVADA.

Luning.

Luning Idaho Mining Co., R. B. Todd, president, and J. C. Skuse, consulting engineer, is developing a copper property in Idaho canyon, 5 miles northeast of Luning, where there is a contact vein between monzonite and silicious sedimentary rock and lime. The ore consists of copper oxides in lime, with some copper sulphides disseminated through monzonite and quartz, all running 4 to 4½% copper. The contact vein is 60 to 70 ft. wide, the ore body within it of varying width. It has been opened by shafts and tunnel levels. The contact is being opened at greater depth by driving a crosscut from the face of a 390-ft. tunnel. A good wagon road has been built from Luning to the mine, a hoist and air compressor are to be put in, and the company will soon be shipping ore. It will cost \$2 per ton to deliver the ore to cars at Luning.

Property of R. B. Todd Mining Co. adjoins that of Luning Idaho. A crosscut has been driven, cutting a diabase

dike within limestone, the dike containing iron oxides, carrying paying gold values with some silver. Some free gold is found, but most of it is associated with the iron. The group has been developed by a shaft and several hundred feet of lateral work. Some shipments have been made and they have one ready to ship. This work is under direction of J. C. Skuse.

New York canyon, southeast of Luning, is a busy part of the district, nine properties being under development and most of them making shipments, as follows: Turk & Wall Street, being operated by Wall Street Copper Co., is hauling to Luning and shipping 40 tons per day running 7 to 10% copper. The Newcastle, operated by Watson & Bachman, is shipping about 5 tons per day. The Mayflower, owned by L. L. Patrick, Goldfield, and operated under lease to Walsh & Rackliff, is shipping 25 tons per day. New York mine, leased to H. B. Lind, Goldfield, is making small shipments. Silver Guardian, owned by Frank M. Smith, Oakland, is leased to H. R. Wagner, Luning, who is shipping ore. The Vacation, owned by Dr. Plymir, is under lease and is a small shipper, as is also the Copper Reef, owned by A. C. Bachman and E. W. Watson, who have a set of leasers at work. All mining in New York canyon is by lateral development, there being no hoisting and little timbering. Most of the ore being shipped runs 6 to 10% copper.

Nevada Champion Copper Co., operating the Nevada Champion and Anderson mine, 4 miles east of Luning, is shipping 20 tons of ore per day, running 4 to 6½% copper. A. C. Bachman has direct charge, J. C. Skuse being consulting engineer.

Copper Wedge Mining Co., with H. O. Howard in charge, has put in position a gasoline operated compressor, and is developing on a monzonite-limestone contact, having opened a body of mixed copper sulphide and oxide ore, running 8 to 12% copper. The ore broken in connection with development work is being shipped.

Old Giroux mine, 7 miles east of Luning, is being operated by Calavada Copper Co., under a lease and bond, the shipments running 10 tons a day of 12 to 15% copper. This is an old mine and is the deepest in this district, the ore being taken from 700 and 1000 levels. Manager Geisendorfer is in charge.

Copper Queen, owned by estate of Fermina Sarrrias, is under control of J. H. Miller, administrator, who has 12 sets of leasers at work, whose aggregate shipments amount to 10 tons per day of an average grade of 12%. Small lots have sampled 40 to 45% copper.

All properties above mentioned are situated in the several canyons east of Luning, 4 to 7 miles from town. Thus far no water is found in those canyons, all water for camp use being hauled in barrels from a 200-ft. well in Luning, the price of water at the well being 25 cts. per barrel to regular customers, and 50 cts. per barrel to transients. Ore shipments from all east side mines amount to 150 tons per day, most of which is handled by Western Ore Purchasing Co., Reno, which has a sampler at Hazen.

West of Luning are the Hartwick, Houghton and Alameda, all small shippers of copper and silver ore. The Lottie mine, an old silver property in that locality, is owned by Delmonte Mining & Milling Co., and is being worked by leasers. The ore contains chloride and sulphide of silver and lead carbonate. Development on company account is being carried on by direction of Jos. Morris of Reno.

J. C. Skuse, E. M., formerly at Wallace, Ida., owns the Kelly's Wells group, 26 miles northeast of Luning. He has a 100-ft. shaft and a 200-ft. crosscut opening disseminated copper in porphyry. The ore is oxidized to a depth of 100 ft. The property, situated 2 miles from Kelly's wells, is under bond to prospective purchasers.

Rochester.

Rochester Merger Mines Co., controlled by men identified with Reno National Bank, is pushing development from the 1360-ft. point in Friedman tunnel, and from the 970-ft. point in Pitt tunnel. The Rochester Mines Co. and Rochester Merger Co. are joint owners of Friedman tunnel, which crosscuts 1567 ft. through Merger ground. It is maintained jointly by the two companies on a 50-50 basis. Pitt tunnel

cuts 971 ft. to their veins, on which there is 950 ft. of drifting. The Sampson shoot, in one vein, yielded ore averaging 1.17 ozs. gold, 25 ozs. silver, and 15% lead; the Pitt shoot of ore, on same vein, gave a general average of 0.08 oz. gold, 15 ozs. silver, and 4% lead. This property is equipped with a new Chicago Pneumatic Tool Co. air compressor, 462-cu. ft. capacity, operated by an electric motor. Three drills are used in drifting, and one in raises. B. R. Binns, superintendent, states that one year's development has been planned. Frank Silva, a graduate of Nevada School of Mines, is doing the assaying and surveying.

Lincoln Hill mine and 2-stamp mill produced gold bullion of value of \$8000 for the first 6 months of 1916. The mine has four parallel veins, which were opened to good depth by adit levels. Most of the production is incidental to development, and it is claimed a recovery of 96 to 97% is made by amalgamation. The mine is equipped with a plant for operating air drills. Clifford Dalorme, manager, states that the ore milled ran \$150 to \$200 per ton.

Rochester Mines Co. operations are conducted mainly through a 400-ft. crosscut intersecting the Foreman, West and East veins at 600 to 680 ft. below their apexes. This is known as the transportation level. The ground above this level is well developed by raises and drifts on the veins and by crosscuts. Drifts extend both ways on these veins from the transportation level, and also from winzes which have been sunk; one winze reaches a depth of 350 ft. on the dip of the vein. These veins are fissures in rhyolite, and range in width from 2 to 30 ft. The entire property is being opened and developed at greater depth by the Friedman tunnel, 1500 ft. long, which crosscuts the formation at a vertical depth of 450 ft. below the transportation level. A number of veins have been cut by this tunnel, and raises are being made to identify them, if possible, as being the same veins as those opened above. One raise has reached a height of 290 ft., and if calculations are correct a connection may be made with a 350-ft. winze sunk on the East vein by extending the raise 270 ft. higher. The mine is producing 118 tons of ore per day, all of which is taken out through the transportation level. A surface cable tramway, 1040 ft. in length, extends from that level to loading bins, the tracks being built on a 35° incline. The ore is hauled in self-dumping skips, the loaded skip down and the empty up running in counter-balance. The ore is hauled from these bins to the cyanide plant over a narrow-gage railroad, nearly 2 miles in length. The grade of the ore is \$9 to \$12 per ton, the gold and silver existing in the ratio of about 0.04 oz. gold to 15 ozs. silver, and by pulverizing to 150 and 200 mesh, and making use of the continuous, counter-current decantation system of cyanidation, an extraction of over 92% is made. The ore contains some antimonial sulphides. The ore, after passing through a jaw crusher, is reduced to about 4 mesh in two 5-stamp batteries of 1550-lbs. stamps. This is followed by pulverizing in two 5 by 16-ft. tube mills. In order to raise the capacity of the plant from 120 to 160 tons per day, an additional tube mill and more tanks are to be put in use. The company buys power from the Nevada Valleys Power Co., paying \$8 per horsepower-month. The milling costs run \$2.25 per ton; mining, \$3; transportation, 50 cts. With the proposed increase of mill capacity, these cost figures are likely to be reduced. It is estimated that one year's supply of ore for the mill is broken and in the stopes. The grade of ore varies much from low to high, but the run of the mine gives a good average. The mine is equipped with three air compressors—1 Sullivan, 1 Fairbanks-Morse, and 1 Rix, giving the capacity of 20 drills. The Waugh stopers, and Sullivan and Ingersoll-Rand mounted Jackhamers are used. The average force employed is 70 men at mine and mill. L. A. Friedman, president of the company, is general manager; C. W. Poole is in active charge as general superintendent; mill superintendent is J. Rasmussen; assayer and chemist is G. Emminger.

Tonopah.

A strike of considerable importance is reported from the West End mine. It was made in the extreme southern portion of the mine at a depth of 600 ft., and in territory entirely virgin. At present the ore body has been opened for a width of 8 ft. with neither wall exposed. Stephanite

and ruby silver is present in considerable amounts, with large streaks of the ore assaying \$50. Developments are proceeding steadily and all indications favor the opening of a large tonnage of excellent ore.

The vein recently uncovered on the 1000 level of the Monarch-Pittsburgh is showing improvement as the drift advances and indications are favorable for development of profitable ore. The vein has been penetrated for 30 ft. and is uniformly strong. Driving of the west drift is proceeding and it should reach the ore body soon. Ventilation has been materially improved and work is proceeding.

Conditions in the Midway are improving. The west drift is beginning to cut stringers of rich quartz and appears to be approaching a good vein. The east drift is following a wide face of low-grade quartz. The crosscut on the 1100 level is showing stringers of low-grade quartz in breccia.

Sinking of the new main winze at the Rescue Eula is progressing, and as soon as the 1050-ft. point is gained, crosscuts will be extended to the Rescue Eula vein and drifts driven both ways in ore. Ore is now coming from five raises above the 950 level, and 205 tons are sent weekly to the West End mill. Arrangements have been made to thoroughly explore the Maggie May claim from the 1100 level of the main shaft. A compressor has been ordered to facilitate rapid work.

Cherry Creek.

Downey Bros., Goldfield, are installing a small oil flotation plant to treat a mill tailings dump of 10,000 tons at Nevada Star mine. These tailings contain silver, lead, zinc, gold and silver. Their equipment comprises gasoline engines, a Hardinge mill, a Callow 1-cell flotation machine and tables.

Yerington.

Empire Nevada Copper Mining & Smelting Co., under the management of J. E. Gelder, is mining and shipping 600 tons of ore per month, being a carbonate and highly silicious. The higher grade ore runs 7% copper, and other grades run 2½ to 3½%.

NEW MEXICO.

Red River.

The El Oro Mining & Milling Co. has been formed by Albuquerque interests. Walter Conklin is one of the leading men and he has recently gone to Denver, Colo., where tests were made on the company's ores. Three milling processes were tried. The company expects to make arrangements for financing a mill with a capacity of 25 tons, and have it operating this fall. About 10 tons of ore a day are now being handled. The men are drifting along a vein and timbering as they go. The holding is said to run about \$35 a ton in gold and silver, and is quite accessible.

Silver City.

The Santa Rita Development Co., with an authorized capital of \$100,000, with \$2500 paid in, has recently been formed and will have its main offices here. It will operate in the Santa Rita district. H. W. Loomis, an incorporator, has been named statutory agent. Others are Elmer S. Morton, San Francisco, and W. W. Lawhon, D. A. Richardson and D. C. Bradford, Douglas, Ariz.

C. W. Henderson, U. S. G. S., reporting on this state for the first half of 1916, shows a considerable increase in the production of lead, copper and zinc. In the Mogollon district, Socorro county, which in 1915 produced 40% of the gold and 63% of the silver output of the state, the Fanny and the Last Chance cyanidation mills were operated continuously, and the Cleveland-Weatherhead mill, idle in 1915, was placed in operation in April. Gold bullion and concentrates continued to be shipped from the Elizabethtown district, Colfax county, and gold bullion from the Whiteoaks district, Lincoln county. The output of silver was affected considerably by the idleness of the Cossack cyanidation mill, in the Cochiti (Bland) district, Sandoval county. Gold-copper are continued to be shipped from Orogrande district, Otero county. The purchase by the Phelps-Dodge Co. of a large area in the Organ mountain

district, Donna Ana county, promises a future production of all five metals. Siliceous and copper ores carrying gold were shipped from the Lordsburg district in quantities that indicate an output nearly double that of 1915. The Santa Fe Gold & Copper Co.'s matting plant at San Pedro was operated continuously. The Burro Mountain Copper Co.'s flotation mill in the Burro mountain district was placed in operation in April, 1916. The Chino Copper Co.'s mill, which in 1915 produced concentrates containing 68,293,893 lbs. of copper, yielded during the first quarter in 1916 a total of 16,267,450 lbs., the total quantity of ore treated for the three months being 714,000 tons, an average of 7850 tons a day, the highest average tonnage treated by the mill since it began operations. Shipments of copper from the Magdalena district increased. Lead ore was shipped from Cooks Peak and Tres Hermanas district, Luna county; from the Central and San Simon districts, Grant county, and from the Magdalena district, Socorro county. Increased shipments of zinc carbonate and zinc sulphide concentrates were made from Magdalena, Hanover, Cooks Peak, Florida, Tres Hermanas, and Pinos Altos districts. A mill was erected in the revived Steeplerock district, Grant county, and some shipments were made.

Pinos Altos.

Plans are now being developed to consolidate all the mining interests on this side of Pinos Altos mountain, of which the Savanna holdings, the C. & O. Mining & Milling Co., and the Silver Hill properties are the important ones. These properties are contiguous and contain the class of ore which has been treated successfully during the past year in the Wright & Stauber mill.

Mogollon.

The new working shaft in Last Chance mine, operated by Mogollon Mines Co., has reached a point 100 ft. below 700 level. Good progress has been made considering character of ground. But a small quantity of water has been encountered thus far. The mill is running steadily, treating about 900 tons of ore per week. The company has inaugurated a change in its system of freight delivery from Silver City. A transfer station, including oil storage tanks, has been erected at Glenwood, some 12 miles from Mogollon, and fuel oil and other supplies are delivered there by truck, from whence they are hauled over the heavy mountain grades to Mogollon by teams. The other operators are still depending on teams or trucks for the entire trip of 80-odd miles.

Most of lumber has been delivered for terminals of aerial wire rope tramway from Pacific mine to plant of Socorro Mining & Milling Co. The ore bins and all other construction are being rushed as much as possible. Cables, buckets, etc., are all on the ground and towers practically completed. The tramway will be about a mile in length.

The Oaks Co., developing the Clifton mine, has encountered good grade of milling ore in a winze being sunk from adit tunnel level. At the Eberle mine, operated by same company, developments are also yielding mill ore. The product of both properties is shipped to custom works of Socorro Mining & Milling Co.

M. L. Nanquin, operating the oil and freight trucks between Silver City and Mogollon, reports a loaded truck-mile cost of \$0.141 based on a total of 5236 truck-miles and an average load of 6500 lbs. It is divided as follows: Repairs, \$0.008; gas and lubricating oil, \$0.033; tires, \$0.038; labor, \$0.062. Average mileage per set of tires, 1396. The grades exceed 20% for short distances in a number of places.

The proposed road from Clifton, Arizona to Mogollon is again receiving consideration. It is understood the Arizona factors will construct a first-class highway to the state line and the Mogollon interests are now running a survey from the Silver City road at Cactus Flats to determine the feasibility of the route. It is said the distance to railroad would thus be shortened by 20 miles with a reduction of \$5 per ton in freight charges. As the in and out freight for this district amounts to many thousand tons a year, the saving would be appreciable.

Delivery of machinery for the hydro-electric power plant of Socorro Power & Lumber Co. has been promised early in January, and it is now believed the plant will be in commission by April. It is designed to generate 250 hp.

OREGON.

Grant Pass.

The Layton placer mine has been sold to Austin Wilson, Boston, Mass., and is now being operated under Superintendent Lester Layton, with a full crew of men. The mine is located on Williams creek. It has been a producer for more than 40 years. There are 38 miles of ditches with the mine, and the water rights are rated as being valuable. The streams from which the water is taken are of such magnitude as to make it possible to carry on active mining operations all the year round. The water is delivered to the hydraulic giants under a head of 300 ft. The property consists of 600 acres of land. The mine will be owned and operated by the Pacific Placer Co., of which Wilson is general manager. It is Wilson's idea to consolidate the Layton mine with a tract of 400 acres adjoining and owned by the Pacific Placer Co., and operate the two properties under the same management, thus making the entire tract to include 1000 acres of land. The property is situated in the Applegate-Williams district, and is easily reached by an auto drive of an hour from this city.

Selina.

On Eight Dollar mountain E. D. Hagen took some samples of what he thought was chrome-iron. These were proved to be tungsten containing the mineral wolframite and some scheelite. Now in company with J. F. Sanders of Roseling steps are being taken to develop the property. The ledge is said to be 20-ft wide and 10-ft. test pits have been put down.

Sumpter.

The Buck Gulch mine has completed its surface work and of the 30 men formerly on the pay roll only a few are left now and these are doing underground development work.

R. W. Derby has brought suit against Thomas and Clair Bessler to attain the rights to dredging ground. Formerly Besslers were plaintiffs in a suit against Derby, but did not gain their ground. For that reason they have hindered Derby's operations on the ground in question and Derby is endeavoring to restrain Besslers from such action.

SOUTH DAKOTA.

Custer.

Norman, Tembath, Holstein and Rule have secured a lease on the American Express group. The ore bodies that will be worked follow on the quartzite over into Blacktail gulch and are on the same level as those in the Wells Fargo group, on which they also hold a lease. The American Express will be worked from the Sheeptail side, and the lessees will work the Wells Fargo from that side also. It is their intention to soon resume work in the Imperial shaft on Blacktail, unwater it and also do some work in the Wells Fargo from that shaft. The work of taking the water from the Imperial shaft was abandoned early in the spring, because there was at that time so much water coming into the workings from surface. They have ordered a new pump, but delay followed its delivery, and it may be a couple of weeks before it can be placed in position. When the work of draining the workings which are controlled from the Imperial shaft on Blacktail starts, it will be rushed until the job has been completed, and will make a very large number of ore bodies in that district available at depth.

Central City.

Shaft sinking at the Hidden Treasure Mining Co. is progressing under Supt. Fish. A depth of 285 ft. has been reached. It is the intention to continue to the 500 level a system of crosscutting and drifting, for development will be pursued. The hoisting and air-compressing equipment, gasoline driven, is working satisfactorily. On the 200 level crosscuts were run east and west for 107 ft. The east crosscut was in ore throughout, but in the west the ore came and

went, indicating that the work was being prosecuted along the apex of the ledge. For this reason it was determined to go deeper, where the solid body of the ledge may be prospected. The fact that the gold values were higher in the east than in the west crosscut led to the conclusion that better grade ore would be encountered at depth, as values are found to be higher where the ore body is more solid and unbroken.

UTAH.

Tintic.

In sinking the shaft of the Eagle & Blue Bell from the 1700 to the 1850 level, it encountered high-grade ore at a depth of 1832 ft. This is declared to be high grade lead-silver, and at present the entire shaft is in the ore. After sinking the main shaft to the 1700 a winze was sent down 80 ft., being in ore the entire distance, and the bottom of the winze was in ore when the work stopped. This is fully 200 ft. away from the shaft. The ore in the shaft runs about \$35, carrying 28% lead and 12 ozs. silver. It is believed that the water level is fully 225 ft. below where the present work is being carried on.

Orders have been issued by the smelter to allow the Iron Blossom to increase its output of copper ore. The winze from the 600 level at the property which encountered copper ore the first of the year has again encountered some high-grade ore at a depth of 1170 ft. This ore is running around 10% copper and will add considerable to the tonnage of the property.

C. F. Sherwood, metallurgical engineer, has been making a number of tests on Tintic ores with the flotation process. He finds that most of the ore yields readily.

On the 2200 level of the Grand Central mine some good-grade copper ore has been encountered and the greater part of the shipments are coming from there. This ore runs 6 to 7% copper and there is quite a large body.

At the Gold Chain some good ore is being mined from the drift of the 1500 level of the Lower Mammoth shaft. A winze has been sunk 150 ft. and it is understood that work will be started shortly from the 1800 level of the Gold Chain to get under this ore. This could be done with about 300 ft. of work.

James B. Allen and M. J. McGill have secured a bond and lease on the Deprezin group of claims adjoining the Centennial Eureka and work will shortly be started on this property.

In order to solve the ventilation question quickly the Tintic Standard will install a large blower fan in the old shaft. The new shaft is now down 75 ft. A new compressor is being installed at the new shaft and three shifts will shortly be put to work. A carload of ore a week is being shipped. The drift on the 1600 level has already cut the ore for 60 ft. and another drift for 18 ft.

North Star.

H. B. Cole, who has just returned from a visit to the Paloma says that the vein on the 500 level is now 7 ft. wide and at least 4 ft. is of good ore. A station is being cut and the ore drifted on. It is also the intention to sink the shaft to the 600 level.

The Cedar-Talisman management intends installing a dry process for the treatment of the low-grade zinc ore. Officials of the company are now in Los Angeles looking into the tests being made. It is declared that the company now has 50,000 tons of low grade ready for treatment.

Lincoln.

Over 50 cars of ore have been shipped from the Creole property since it was leased to Dern & Griggs. A new hoist recently arrived on the ground and is being installed.

The ore body has been struck on the 155 level at the Croff property. This is 100 ft. below where it was encountered in the 55 level and from 2½ ft., which the fissure was there, it has widened out to 9 ft. The fissure carries a large amount of galena and lime spar. Machine drills are now opening up the ore and in 16 ft. along the strike of the ore,

the average samples, which are sulphides, carried 30% zinc, 21% lead, 1.5 ozs. silver, and 40 cts. gold.

American Fork.

At a recent meeting of the directors of the Mineral Flat Mining Co., controlled by Jesse Knight, it was decided that work be resumed at once on the property, which is at the head of American Fork canyon. To carry out the work the 146,976 shares in the treasury are to be sold to the stockholders at 4 cts. a share, 17 shares going to each 100 shares held. The offer stands to Aug. 10. Mineral Flat is the best equipped property in the district having ample accommodations for 50 men, the property is electric lighted from its own power plant and a large amount of work has been done.

The Silver Flat property has started operations. The tunnel shows some molybdenum.

The American Fork Development & Mining Co. has started operations in the tunnel on its ground which shows a large deposit of hematite iron.

C. W. Earl, who has a lease and bond on the Austin patented claim between the Earl-Eagle and the Globe Con. has two shifts at work cleaning out the old tunnel.

Another car of silver-copper ore has just been marketed by the Fissures Exploration Co., which has a 10-year lease on the Pacific property. The shipment contained 51 tons which averaged 0.035 oz. gold, 124 ozs. silver, 3.91% copper, 24.6% iron and 27.4% sulphur. The stope at the end of the north drift is now up 40 ft., and is still in good ore. New bins have been put in at the mine and a large amount of milling ore is being added to the dump.

All the tables for the new 60-ton mill at the Dutchman mine on Dutchman Flat are now at the property, and the shafting and other machinery which was purchased from the New England Co. at Bingham is now in the shop, being overhauled ready to install. The tunnel has been cleaned out and retimbered for 800 ft.

It is understood that the Fissures Exploration Co. will start suit against Peter Miller and Bert Durrant, locators of the Copper Gance property adjoining the Pacific property on the north. Miller and Durrant were in charge of the development of the Pacific at the time they located the ground.

Big Cottonwood.

At the South Cardiff property trenching is being carried on to find the intersection of the Cardiff and Howell fissures. It is believed that the intersection will be found either on the Peak or Beauty claims.

At the Reeds Peak two shifts are moving ahead at the rate of 8 ft. a day. The tunnel is in about 900 ft. and it is estimated that the Birthday fissure will be encountered at 936 ft.

Ore from the Cardiff is being hauled by teams to the big ore bins recently erected by the Cardiff at the mouth of South Fork, and from there to the smelter at Murray the ore is being taken down by tractors. Three trains consisting of a tractor and seven trailers for the first two trains, and a tractor and four trailers for the third train. The last train was loaded with timbers and made the trip in 6 hours. The trailers hold 5 to 6 tons, and from 250 to 300 tons of ore a day are to be hauled. The tractors are also being used for hauling ore from the Maxfield mine.

Alta.

The Triangle lease on the Michigan Utah property is sending out from 1 to 3 cars of ore a day, or an average of about 80 tons. In the old workings some high-grade copper ore running from 3½ to 4% is being opened up. From leasing operations alone the company is receiving from \$2000 to \$3000 a month. At the same time there is considerable work being done on company account.

The East Hecla Mines Co. has started operations in the 100-ft. shaft. Supt. David J. Cook is grading for a permanent tunnel site and buildings. The company owns 150 acres in Alta.

General Manager R. O. Dobbs of the Cottonwood Atlantis believes that before long ore will be encountered in the Contact tunnel. This tunnel was driven about 125 ft. by former operators, and where a turn was encountered in the contact it was lost, and about 25 ft. was driven in the quartz-

ite. The new management started working where the quartzite was first encountered, since which time the tunnel has been directed along the contact. The ground is now softer and the mineralization has been increasing.

In the Sells ground the company is driving a raise on Wedge fissure up from 1200 level. This fissure has yielded the rich ore in the South Hecla and the line formation is declared to be identical in the Sells.

The Alta Con. is breaking down a car of ore a week and is also doing a large amount of development work.

There is considerable talk of the South Hecla taking over the property of the Albion Mining Co. George H. Watson is general manager. The South Hecla has 250,000 shares in its treasury with which to take over the property.

Bingham.

The Utah Apex mine is earning close to \$500,000 a quarter at present. The last quarterly report for the quarter ending May 31, 1916, showed net earnings of \$417,948 and since then it is declared there has been an improvement.

Shipments from the Lark side of the Bingham Amalgamated are now at the rate of 150 tons of ore a week. The ore is running around 5 to 6% copper, 50 cts. to \$1.50 in gold and 1.5 to 3 ozs. in silver.

The Yosemite Mines Co., a subsidiary of the Bingham Mines Co., is shipping ore regularly and is opening up some good ore bodies it is declared.

The Congor mine at Bingham, which has been idle for many years, is now shipping a car of ore a day from an old incline at a depth of about 200 ft. This will average 6% lead with values in gold and silver. Since work started the company has shipped 2000 tons of ore.

It is understood that an apex suit will probably be filed by the Utah Metal & Tunnel Co. against the New England Gold & Copper Mining Co. of Massachusetts. The suit was prepared several years ago and never filed.

Park City.

Supt. John Forsman of the American Flag mine says that the ore in the Easter raise has widened out to 8 ins. The property is now operated under a lease and bond to the Park City Mines Co. A shipment will be made in a few days.

In a letter to the stockholders of the Big Four Exploration Co., President M. P. Kirk says that the engineers figure the tailings deposit at the Atkinson mill owned by the Big Four, will return net profits of approximately \$180,000 a year or 15% on the par value of the stock.

Mining operations have been resumed on the Revelator property in the Samke Creek end of the district.

Gold Strike.

Miners at the Gold Strike Bonanza ground in the gold camp of Gold Strike are preparing to develop a 2½-in. streak of ore that pans unusually high. This is at a depth of 50 ft. The shaft is down 84 ft. and the bottom is in a good quartz that is also showing values. Work has been resumed on the Hassaampai and several other properties in the district.

WASHINGTON.

Spokane.

Bitter opposition to the selection of Seattle as the location for the federal mining experiment station for the north-west is being aroused among the general business interests of the intermountain territory, and protests have been sent from different parts of eastern Washington and practically all of Idaho and Montana to Franklin K. Lane, Secretary of the Interior, and the congressional delegations from the three states. Commercial organizations and mining associations in the different districts have joined in the protests, and the result has been that Secretary Lane has announced that Director Manning of the federal Bureau of Mines will soon visit Spokane to personally investigate the situation. The protests are based on the contention that Seattle is not a logical site for the station, in that it is remote from all the

producing metal mining regions of the northwest, and that if the plant is located there it will defeat the government's purpose in establishing it. Different points in the intermountain region have been suggested as a site for the experimental plant, but there is a tendency to unite on any place in the mineral region that will be satisfactory to the majority, and the fight at present is being confined to convincing Secretary Lane that Seattle would not be considered in any event. Spokane is being advanced as a candidate for the station, the leaders in the movement basing their claims on the fact that the city is a recognized financial, mining and transportation center, and that many of the companies operating in the different camps in Washington, Idaho, Montana and Oregon have their head offices here. It is further pointed out that much of the ore in these districts is refractory and hard to treat, and that for this reason it is imperative that the station be located at a point convenient to the mines, else it will not be possible for the owners of the properties to avail themselves of the facilities of the station.

The Conconully and Ruby mining districts are in the north-central part of Washington, about 40 miles south of the Canadian border. The ore deposits were discovered as long ago as 1886, but the production has been small, owing to lack of transportation facilities, difficulty in treating complex ores, and the decline in the price of silver. The most valuable ore deposits in these districts consist of quartz veins which occur in schists near the areas of granite or at the contact of schist and granite. The ore minerals, pyrite, zinc blende, chalcopyrite, and gray copper, carry silver and a little gold. A report on these districts, by Edward L. Jones, Jr., just published by the Geological Survey as Bulletin 640-B, contains a study of the geology and mineralogy of the region and detailed descriptions of the individual mines and prospects.

developments, is still having trouble with water, forcing the management to make an upraise into the top flat now being mined and making 32% ore. The lower level is in bad ground, making operations there hazardous. New drill holes to the south on the Hird lease reveal immense deposits of zinc ores.

Seven drilling machines are employed for the Frontier at this writing on the Hird, Calvert, Treganza, Robson and Carey leases. On the last named uniform richness of strikes on the range insure another good zinc ore producer. Drills for the company on the Drill-Hole prospect meet with small runs of ore in the oil rock strata, but no basin formations have as yet been encountered. The work of exploration will continue indefinitely. On the Burr-Treganza mine production is being maintained at the rate of 175 to 200 tons of 45% weekly. Dividends are paid on a capitalization of \$30,000, at the rate of 25% monthly.

Shipments of zinc concentrates from mines of this district for week of July 29th totaled 61 cars, all current production, 5,220,000 lbs.; for week of Aug. 5th, 48 cars, 3,890,000 lbs. Much ore was carried over through a scarcity of cars. New shipping companies are the Wilkinson Mining Co. and Sally Mining Co. Others holding ore and ready to make initial deliveries are the Acker Mining Co. and Hoffman Mining Co., both with new equipment. Drilling operations continue in this district for several new companies, and nearly all the regular producers. Shafts are down in ore for the Greater Mining Co., Domestic Mining Co. and Buchan Mining Co. On the last named a 100-ton mining and power plant is being planned. Longhenry-Mining Co., operating the Spenseley lease, has several cars ready for shipment and ground well opened up. A larger power and milling plant is immediately necessary.

Highland.

Shipment of carbonate zinc ore was made last week by the New Jersey Zinc Co. from company mines to Mineral Point, 2 cars, 60 tons. A new milling plant was set in operation at the Saxe-Lampe mine. Another goes into commission soon on the Kennedy mine.

Linden.

Linden Zinc Ore Separating Co. reported no sales last week. Milwaukee-Linden, Ross Bros. and Saxe-Pollard each shipped to Mineral Point and Hinkle mine, 1 care to Cuba. Spring-Hill Mining Co. started up with a new plant the first of this week. Another new plant is building for the Mineral Point Development Co.

Miffin.

Shipments last week came from the Peacock mine to American Metals Co., 38 tons; Lucky Six to LaSalle, 2 cars, 82 tons; Biddick mine to Benton, 2 cars, 81 tons; Coker mines to Mineral Point, 7 cars, 281 tons; Rundell mine to Cuba, 2 cars, 82 tons. Goodsell Billings Co. made their initial shipment last week, 1 car high grade to LaSalle, 25 tons. M. & A. Mining Co. has a new plant in commission on the Big Tom mine. Another new plant is nearing completion for the Vinegar Hill Co. on extensions of the Rundell ranges mined successfully the past 8 years.

Mineral Point.

Shipments of zinc ore for week of Aug. 5th totaled 119 cars from mines, 4662 tons. Lead ore from the Fields mine, 80,000 lbs.; Nels Snow Linden, 77,970; Champion, 40,000 lbs.; Winskill, 30,000 lbs.; Blackstone, 80,000 lbs.; Fox, 86,000 lbs.; Utt-Thorne, 60,000 lbs.; all to Federal Lead Co. Shipments of pyrites were light, 478,900 lbs. The gross recovery mine run for the week aggregated 7,748,000 lbs.; net refined ores to smelters, 4,040,000 lbs. The Mineral Point Zinc Co. shipped 16 cars high-grade refinery product to smelter at DePue, 600 tons. Both top and high-grade ores slumped \$5 during the week, 60% ore going at \$60 basis. Second and medium ores, \$52 for grades as low as 50% zinc. Low-grade ores were in better demand. Receipts of raw ore and refineries of the New Jersey Zinc Co. for the week, 31 cars, 1164 tons. Heavy importations of carbonate, silicate and low-grade calcined blende ores from far western states and Mexico continue. Locals delivered 41 tons to furnaces.

Cuba.

Receipts of raw ore ran exceptionally high at the National Ore Separators, 27 cars, 1073 tons; 6 cars came from low-grade independent operators. Shipments of high-grade

WISCONSIN-ILLINOIS.

Platteville.

Ore shipments from mines to separating plants and smelters direct for July were:

District.	Zinc, lbs.	Lead, lbs.	Pyrites, lbs.
Benton	21,148,000	162,230
Cuba	5,168,000	3,104,400
Dodgeville	80,100
Galena	6,102,000	286,900
Hazel Green	4,922,000	50,000
Highland	1,090,000
Linden	4,044,000	80,000	240,000
Miffin	5,538,000	86,000
Mineral Point	292,000	1,103,100
Montfort	88,000
Platteville	3,512,000
Potosi	474,000	30,000
Shullsburg	2,000,000
Totals	54,288,000	680,230	4,533,500

The net deliveries out of the field to smelter from ore refineries and mine run stuff, all high grade, aggregated 25,260,000 lbs. The Mineral Point Zinc Co. delivered 83 cars refinery ore to DePue, 6,220,000 lbs.

Stockholders of the Wisconsin Zinc Co. received dividend checks the 31st, 2%, or \$20,000. This is the second quarterly dividend on a basis of 8% per annum.

Shipments from local operators for week of Aug. 5th were light, and much concentrates, both high grade and raw ore, was carried over.

Benton.

The Frontier Mining Co. paid its regular monthly dividend of 2%, Aug. 1. A 10% additional dividend is also paid, as the surplus in the treasury justifies. The company is one of the most active of all the large operating companies in this field at present. The Calvert mine is making 3 cars of concentrates weekly from range on south side of lease, and is now opening up a new synclinal basin on the west side of the Calvert lease. Drills checking on the range show tremendous deposits of zinc ore. The Bull Moose mine, a Frontier development, is making 200 tons of 42% weekly. A new 2-compartment shaft is now in ore on the south side of the lease, and plans for a new power, mining and milling plant are being made. The Hird mine, the most recent of Frontier

out to Illinois Zinc Co., 4 cars, 148 tons; Granby Con., 6 cars, 219 tons; Utt-Thorne Mining Co. to Benton Roasters, 2 cars, 80 tons.

Montfort.

The O. P. David, reported shut down, resumed shipping this week sending 1 car to Cuba for separation, 44 tons. Work in the mine has been resumed.

Hazel Green.

The Kennedy mine continues shipping, last week clearing 4 cars, 130 tons; Monmouth Zinc Co. to Mineral Point, 39 tons. Cleveland mine, reported exhausted, recovered with 3 cars, 123 tons, to Galena. Lawrence to Galena, 6 cars, 245 tons.

Galena.

Black-Jack mine, going steadily once more, shipped 3 cars last week to Mineral Point, 112 tons; Galena Refinery Co. to LaSalle, 30 tons; to Lanyon Zinc Co., 40 tons; Edgar Zinc Co., 3 cars, 130 tons. The Graham mine of the Vinegar Hill, with its initial shipment to Cuba, 2 cars, 83 tons; North Unity to Cuba, 3 cars, 122 tons; Wisconsin Zinc Roasters to LaSalle, 3 cars, 108 tons. Great Western Lead Mfg. Co., after years of successful production of zinc ore and the payment of nearly \$400,000 in profits, has become involved in litigation. The Great Western mine, it is claimed, is exhausted. New leaseholds are being prospected. James Billingsley is engaged with drills on the Hess farm on the crest of Pilot Knob.

WYOMING.

The Mondell bill for the leasing of oil and gas lands on Indian reservations in Wyoming has been approved by Secretary Lane and the Public Lands committee, Washington, D. C., and has been introduced in Congress. The bill provides that the Secretary of the Interior is empowered to lease for the production of oil and gas, lands within the ceded portion of the Shoshone or Wind River Indian reservation, under such terms and conditions as shall be by him prescribed; and the proceeds or royalties arising from such leases shall be first applied to the extinguishment of any indebtedness of the Shoshone Indian tribe, and thereafter shall be applied to the use and benefit of said tribe in the same manner as though secured from the sale of said lands, as provided by the Congress, March 3, 1905. The leases granted under this act shall be conditioned upon the payment by the lessee of such royalty as may be fixed in the lease, which shall not be less than 10% in amount or value of the production and the payment in advance of a rental of not less than \$1 per acre per annum during the continuance of the lease. The rental paid for any one year is credited against the royalties as they accrue for that year. Leases shall be for a period of 20 years, with the privilege for the lessee to renew the same for successive periods of 10 years each upon such terms as may be prescribed by the Secretary of the Interior, unless otherwise provided by law at the time of expiration of any such period. Leases shall be irrevocable except at the end of the terms. They may be forfeited by an appropriate proceeding in the United States district court for Wyoming whenever the lessee fails to comply with the terms and conditions.

CANADA.

BRITISH COLUMBIA.

Nelson.

Dr. W. H. Willson, Barney Crilley, H. Y. Anderson and Thomas Gough, lessees of the Granite-Poorman mine, have completed their cleanup at the mill, and the property is now ready to be taken over, mill and mine, by the Spokane and Butte capitalists who recently bonded it and who have already paid \$10,000 down. The bondholders of the mine are John McGinnis of Butte, W. E. Cullen and R. A. Carnochan of Spokane. The purchasers have men at work on the surface preparing for development which is to be undertaken in the Poorman and Hardscrabble workings.

ONTARIO.

Cobalt.

Eight mines in this district shipped 490.37 tons during the week ended July 9, and this is noted as the largest production for some time past. McKinley-Darragh led and shipped 4 cars, containing an aggregate of 317,400 lbs., and Nipissing, 4 cars, containing 263,000 lbs. Casey Cobalt was on the list with 1 car, consigned to Deloro. All 4 cars from Nipissing went to Welland, and of those from McKinley-Darragh, 3 went to Perth Amboy and 1 to Marmora. The shipment from O'Brien went to Marmora also. Both Beaver and Temiskaming shipped to Thorold. Nipissing was the only bullion shipper during the week, sending out 96 bars containing 112,210.80 ozs., valued at \$72,357.97.

At the King Edward mill the old concentrating machinery is being taken out and will be replaced by the Callow flotation machines. It is the intention to dredge the tail's of the old plant from the lake and retreat them, as extraction by the old plant was very low. It is possible that, providing results are as good as anticipated, some of the dump rock will be crushed and treated. The King Edward property proper is being explored by the National Mines, Ltd., which has a lease on the King Edward, but it is understood that one of the local customs concentrating companies has made arrangements with the former company regarding the tailings and dump.

In a letter sent to stockholders of Temiskaming the following is given: "The main shaft has reached depth of 1180 ft., a working station having been cut at the 1150 level. We shall continue sinking until the lower contact between diabase and keewatin is reached, which we have proven exists at a depth of 1600 ft. Then we shall commence the development of this lower contact. On the upper levels of the mine work is progressing favorably and we are recovering some high grade. Some surface work in the way of trenching is being done on the Gans lot, as well as on the McDonald claim at North Cobalt. No work is being done at the present time on the North Dome property in Porcupine. We recently leased our Red Jacket claim to a syndicate who are dewatering the shaft in anticipation of development." The statement shows that the company is in a good financial position, with \$170,210.02 cash on hand, bullion in storage of 311,922.84 ozs., ore in smelters, 90,276.14 ozs., making a total of 502,287.98 ozs., which, valued at present prices of silver, is worth over \$300,000. From this the present dividend of \$75,000 must be deducted.

Kirkland Lake.

A 7-drill Ingersoll-Rand compressor has been ordered for the Lake Shore mine. The new compressor will be power and belt driven. As soon as installed it can be run by steam and when the Northern Ontario Light & Power Co.'s transmission line is completed electricity will be used. According to latest estimates made the ore reserves now blocked out are in the neighborhood of \$300,000 and as yet only about 10% of the known fractured area has been prospected. The extent of the large ore body struck in drifting on the 100 and 300 levels is not known, but the management is confident that it persists to greater depth. Sinking to lower levels will be resumed on the completion of the installation of new machinery, including the compressor, a new headframe, hoist and cage. The property was closed down a month ago to allow for the installation, which will, it is expected, be completed in September. When work was stopped the face of the West drift on the 300 level was in \$53 ore and that on the 100 level was in good milling ore. As to the building of a mill, the management proposes to wait for a few months of further development before definite action is taken, but an efficient 60-ton mill has been arranged for.

Matheson.

In the mining districts about Cobalt and Porcupine brush fires have started again and the death toll has been noted at various figures, from 134 to 450. The Croesus mine, 10 miles from here, has had its surface plant swept clean and reports state variously between 5 and 10 of the company staff are unaccounted for.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Iron and Steel

Carnell, W. C.—*Acid Resisting Alloys.* [A paper read before the American Inst. of Chem. Eng. Deals with the properties of duriron, tantiron and the like].—*Iron Age* July 27 1916; p 182; pp 1¾; 30c.

Harbord, F. W.; Hall, J. W.—*Metallurgy of Steel.* [An up-to-date review of practice in steel metallurgy].—*Lippincott Co.*; book; pp 933; \$12.50.

Sauveur, Albert.—*Detecting Alumina Inclusions in Steel.* [A microscopic investigation as to the occurrence and appearance of alumina particles].—*Iron Age* July 27 1916; p 180; pp 2*; 30c; 1. *Tr. Rev.* July 27; p 179; pp 2*; 25c.

— *German Steel Syndicate and Cartells.* [The syndicate, its formation, operation and effects on the industry].—*I. & C. Tr. Rev.* July 7 1916; p 1; pp 4; 35c.

— *Pacific Coast Steel Co.'s Plans.* [The plants described are located at both Seattle, Wash., and San Francisco, Cal.].—*Iron Age* July 27 1916; p 175; pp 4½*; 30c.

Iron and Steel: Foundry and Furnace Practice

Harbord, F. W.; Hall, J. W.—*Metallurgy of Steel.* [An up-to-date review of practices in steel metallurgy].—*Lippincott Co.*; book; pp 933; \$12.50.

Johnson, J. E., Jr.—*Blast Furnace Irregularities and Their Treatment.* [Treats on the troubles of the water supply to the water jackets].—*Met. & Chem. Engg.* Aug. 1 1916; p 127; pp 3½; 35c.

— *Pacific Coast Steel Co.'s Plans.* [The plants described are located at both Seattle, Wash., and San Francisco, Cal.].—*Iron Age* July 27 1916; p 175; pp 4½*; 30c.

Lead

Hodgkinson, H. H.—*Mining Ore from Pillars.* [A method used by the New Jersey Zinc Co. It is a combination where top-slicing is begun at the bottom of the body and raised from level to level by shrinkage stoping].—*E. & M. J.* July 29 1916; p 217; pp 2½*; 25c.

Parodi, Lorenzo.—*Ricordi e Note Sulla Metallurgia Italiana.* [A record of the metallurgical production of metals in Italy during 1914 and 1915].—*Metallurgia Ital.* April 30 1916; p 200; pp 15; \$1.

Verne, C. E.—*Zinc's Record Breaking Year.* [A review of the first part of 1916 in the Joplin district].—*Zinc & Lead Jnl.* June 1916; p 3; pp 2*; 20c.

Whitaker, W. A.; Belchic, George; Neal, Roy; Van Velzer, H. L.—*Flotation Experiments on a Joplin Tailing.* [The results from using a number of different

oils are tabulated and discussed. Testing was done with 400-gm. samples].—*Met. & Chem. Engg.* Aug. 1 1916; p 131; pp 7; 35c.

— *United States Metals Refining Co.'s Plant, Grasselli, Indiana.* [A description of the steam and electric power plants at the electrolytic lead refinery].—*Pract. Eng.* Aug. 1 1916; p 641; pp 4½*; 20c.

Nickel

Guess, G. A.; Lathe, F. E.—*An Investigation Into the Flowing Temperatures of Copper Mattes and of Copper-Nickel Mattes.* [A number of tests and investigations to determine the temperature at which the two mattes will flow].—*Bull. A. I. M. E.* June 1916; p 1067; pp 6*; 35c.

Parodi, Lorenzo.—*Notizie Sulla Metallurgia del Nickel Importanza del Nickel nell'odierna Metallurgia.* [Notes on the metallurgy of nickel today. Deals with the situation and methods employed in the principal producing countries].—*Metallurgia Ital.* May 31 1916; p 355; pp 14; \$1.

Parodi, Lorenzo.—*Ricordi e Note Sulla Metallurgia Italiana.* [A record of the metallurgical production of metals in Italy during 1914 and 1915].—*Metallurgia Ital.* April 30 1916; p 260; pp 15; \$1. **Silver**

Parodi, Lorenzo.—*Ricordi e Note Sulla Metallurgia Italiana.* [A record of the metallurgical production of metals in Italy during 1914 and 1915].—*Metallurgia Ital.* April 30 1916; p 260; pp 15; \$1.

Scott, W. A.—*Commonwealth Mine and Mill, Pearce, Arizona.* [Gives details on operations and description of methods used].—*Mg. World* July 29 1916; p 187; pp 1½*; 10c.

Way, Herbert, W. L.—*The Minerals of Sze-Chuan, China.* [Brief description of the deposits, their possibilities and operation. Salts have been mined, petroleum is plentiful and gold, silver and copper give promise].—*Mg. Mag.* July 1916; p 20; pp 4*; 50c.

— *Rhodesia Report of the Executive Committee of the Chamber of Mines and Production of Gold and Other Minerals in May, 1916.* [The production of operating gold companies are given individually].—*Rhodesia Chamber of Mines Report* May 1916; pp 6.

Silver Milling, Metallurgy, Etc.

III. TECHNOLOGY

MINES AND MINING

Surveying and Drafting

Marshall, R. B.—*Spirit Leveling in Arkansas, 1896 to 1915*. [Data and a description of the location of bench marks in the state].—U. S. G. S. Bull. 636; pp 56*; 15c.

Marshall, R. B.—*Spirit Leveling in Maine, 1899 to 1915*. [Data and descriptions of the location of all U. S. G. S. bench marks in the state are given].—U. S. G. S. Bull. 633; pp 64*; 15c.

—*Ingenious Special Devices for Tunnel Surveys*. [Abst. from Eng. News. Instruments and devices for marking are described].—E. & M. J. July 22 1916; p 180; pp 1¾*; 25c.

Shafts and Shaft Sinking

Buffum, F. D.—*Compressed Air for Sinking a Shaft*. [Abst. from Coal Age. Deals with methods of piping and handling the compressed air which was used entirely for power. Remedies for difficulties encountered are given].—Comp. Air July 1916; p 8048; pp 3*; 20c.

Miller, Benjamin Leroy; Singewald, J. T.—*The Gold Mines of Brazil*. [The two most noted mines are described. The power question, mining and refining of the ore are dealt with].—E. & M. J. July 29 1916; p 207; pp 5*; 25c.

Schmidt, Frederick.—*Shaft Sinking by the Freezing Process*. [A paper read before the Manchester Mining & Geol. Soc., England].—J. & C. Tr. Rev. June 23 1916; p 720; pp 1; 35c. Colly Guard. June 23; p 1189; pp 4*; 35c.

Ventilation

Buffum, F. D.—*Compressed Air for Sinking a Shaft*. [Abst. from Coal Age. Deals with methods of piping and handling the compressed air which was used entirely for power. Remedies for difficulties encountered are given].—Comp. Air July 1916; p 8048; pp 3*; 20c.

Miller, Benjamin Leroy; Singewald, J. T.—*The Gold Mines of Brazil*. [The two most noted mines are described. The power question, mining and refining of the ore are dealt with].—E. & M. J. July 29 1916; p 207; pp 5*; 25c.

Transport

Eddy, L. H.—*Sonoma Magnesite Mines, California*. [Describes the development, transportation and calcining of the ores for shipment].—E. & M. J. July 29 1916; p 225; pp 2*; 25c.

Robertson, A.; Johnston, A. M.—*Belt Conveyors*. [On the life and proper loading of belts].—S. Afr. Engg. June 1916; p 107; pp 2½*; 35c.

Haulage and Conveying

Scott, W. A.—*Commonwealth Mine and Mill, Pearce, Arizona*. [Gives details on operations and description of methods used].—Mg. World July 29 1916; p 187;

Warren, H. M.—*Electrical Distribution and Application in Mines*. [Speaks of the use of electricity for pumps, hoists, locomotives, drilling and air compression].—Coal Age July 22 1916; p 138; pp 4*; 20c. pp 1½*; 10c.

—*American Coal Mine Haulage*. [Describes the practice in detail].—Colly Guard. July 14 1916; p 61; pp 2½*; 35c.

Production

Hewett, D. F.—*Manganese and Man-*

ganiferous Ores in 1915. [Primary ores, both domestic and foreign, are spoken of, as also are the production and values of ores].—Min. Res. of U. S. 1:4; pp 15.

Katz, Frank J.—*Silica in 1915*. [Takes up the uses of silica, its production in general and by states, with briefs on other important siliceous materials].—Min. Res. of U. S. 11:8; pp 6.

Middleton, Jefferson.—*Pottery in 1915*. [Treats on the production of materials used in the manufacture of pottery and the amount of pottery manufactured. The production of states is tabulated].—Min. Res. of U. S. 11; pp 11.

Muth, E. G.—*Great Increase in Spelter Production*. [A review of production for the first half of 1916].—Zinc & Lead Jnl. June 1916; p 5; pp 2½; 20c.

Orr, Charles T.—*Progress in Our Zinc Mines*. [Deals with progress in the mines of the Missouri-Kansas-Oklahoma district].—Zinc & Lead Jnl. June 1916; p 16; pp 2*; 20c.

Parodi, Lorenzo.—*Ricordi e Note Sulla Metallurgia Italiana*. [A record of the metallurgical production of metals in Italy during 1914 and 1915].—Metallurgia Ital. April 30 1916; p 260; pp 15; \$1.

MILL AND MILLING

Flotation

Hilderbrand, Joel H.—*Principles Underlying Flotation*. [Abst. of an illustrated lecture before the American Chem. Soc. and A. I. M. E.].—M. & S. P. July 29 1916; p 168; pp 3*; 20c.

Lewis, R. S.; Ralston, O. C.—*Patents Relating to Oil-Flotation Processes*. [Short descriptions of patents dating from 1879 on are given].—Utah Engg. Experiment Sta. Bull. No. 8; pp 56.

Whitaker, W. A.; Belchic, George; Neal, Roy; Van Velzer, H. L.—*Flotation Experiments on a Joplin Tailing*. [The results from using a number of different oils are tabulated and discussed. Testing was done with 400-gm. samples].—Met. & Chem. Engg. Aug. 1 1916; p 131; pp 7; 35c.

Concentration: Sorting, Sizing, Washing

Gudgeon, C. W.—*The Scheelitz Gold Mines of Otago, New Zealand*. [Several properties are described. In each the ore body, milling process and milling and mining costs are dealt with].—Proc. Aus. Inst. M. E. No. 21 1916; p 37; pp 14*; 65c.

Miller, Benjamin Leroy; Singewald, J. T.—*The Gold Mines of Brazil*. [The two most noted mines are described. The power question, mining and refining of the ore are dealt with].—E. & M. J. July 29 1916; p 207; pp 5*; 25c.

Scott, W. A.—*Commonwealth Mine and Mill, Pearce, Arizona*. [Gives details on operations and description of methods used].—Mg. World July 29 1916; p 187; pp 1½*; 10c.

Cyaniding

Miller, Benjamin Leroy; Singewald, J.

dei Giacimenti Petroliferi e Solfiferi. [On the method of formation of petroliferous and sulphurous materials].—Ind. Chim. Min. & Met. June 10 1916; p 177; pp 5; June 25; p 193; pp 3¾*; 70c.

Wade, Arthur.—*Petroleum Prospects on Bruny Island, Tasmania*. [Deals with the geology and possibilities there].—Tasmania Parliament Report No. 60; pp 6*; 50c.

Way, Herbert, W. L.—*The Minerals of Sze-Chuan, China*. [Brief descriptions of the deposits, their possibilities and operation. Salts have been mined, petroleum is plentiful and gold, silver and copper give promise].—Mg. Mag. July 1916; p 20; pp 4*; 50c.

Fuels Miscellaneous

Cooper, Stanley G.—*The Production and Use of Power and Its Relation to Fuel Economy*. [Curves and detailed information].—I. & C. Tr. Rev. July 14 1916; p 44; pp 1*; 35c.

—*Oil Fuel*. [On methods of pumping and piping the oil to the burners].—Pract. Eng. Aug. 1 1916; p 648; pp 1¾*; 20c.

—*Smokeless Fuel, Gas, Oil and Ammonia Production*. [A description of equipment used and some details on the methods of operation].—I. & C. Tr. Rev. July 7 1916; p 10; pp 2*; 35c.

(B) STRUCTURALS AND CERAMICS

Clays, Ceramics

Arbogust, C. O.; Sheridan, L. J.—*The Open Door to Results in Burning*. [On the use of pyrometry in brick and clay furnace work].—B. & C. Rec. Aug. 1 1916; p 216; pp 5; 35c.

Middleton, Jefferson.—*Pottery in 1915*. [Treats on the production of materials used in the manufacture of pottery and the amount of pottery manufactured. The production of states is tabulated].—Min. Res. of U. S. 11; pp 11.

(C) OTHER NON-METALS

Acids

Carnell, W. C.—*Acid Resisting Alloys*. [A paper read before the American Inst. of Chem. Eng. Deals with the properties of duriron, tantiron and the like].—Iron Age July 27 1916; p 182; pp 1¼; 30c.

Gilbert, J.—*Costs and Profits of an Up-to-Date Spelter Works*. [A practical consideration of the subject and operations connected therewith].—Mg. Jnl. July 15 1916; p 496; pp 1¾; 35c.

Gems

Mellor, E. T.—*The East Rand, South Africa*. [A description of the formation of the country].—S. Afr. Engg. June 1916; p 102; pp 2½*; 35c.

Purington, C. W.—*Precious Stones in the Urals, Russia*. [A description of the deposits and their location].—Mg. Mag. July 1916; p 24; pp 2*; 50c.

Magnesite

Eddy, L. H.—*Sonoma Magnesite Mines, California*. [Describes the development, transportation and calcining of the ores for shipment].—E. & M. J. July 29 1916; p 225; pp 2*; 25c.

Richards, J. W.—*The Metallurgy of the Rarer Metals*. [Abst. from a paper read before the American Inst. of Chem. Eng. Discussing the importance of the future of magnesium, chromium and other metals].—Mg. World July 15 1916; p 93; pp 1¼; 10c.

T.—*The Gold Mines of Brazil*. [The two most noted mines are described. The power question, mining and refining of the ore are dealt with].—E. & M. J. July 29 1916; p 207; pp 5*; 25c.

Scott, W. A.—*Commonwealth Mine and Mill, Pearce, Arizona*. [Gives details on operations and descriptions of methods used].—Mg. World July 29 1916; p 187; pp 1½*; 10c.

Mill and Smelter Costs

Gilbert, J.—*Costs and Profits of an Up-to-Date Spelter Works*. [A practical consideration of the subject and operations connected therewith].—Mg. Jnl. July 15 1916; p 496; pp ¼; 35c.

Gudgeon, C. W.—*The Scheelite Gold Mines of Otago, New Zealand*. [Several properties are described. In each the ore body, milling process and milling and mining costs are dealt with].—Proc. Aus. Inst. M. E. No. 21 1916; p 37; pp 14*; 65c.

Stannard, O. J.—*Chemical Methods of Extraction*. [Deals with the chemistry and brief description of thermic, electro and hydro metallurgical processes. A discussion of costs is also given].—Mg. Mag. July 1916; p 15; pp 5; 50c.

CHEMISTRY AND ASSAYING

Chemistry

Hesse, Bernhard, C.—*Revision of Our Chemical Statistics*. [Lists of chemicals produced are given and it is stated that U. S. needs to give information about a greater number of these products].—Met. & Chem. Engg. Aug. 1 1916; p 143; pp 6; 35c.

Matheson, A. M.—*Notes on the Chemical Assay of Tin Ores*. [Discussion of the chemical and fire assay of pyritic tin ores show that mill losses can not be estimated by vanning and the fire method].—Proc. Aus. Inst. M. E. No. 21 1916; p 1; pp 7; 65c.

Stannard, O. J.—*Chemical Methods of Extraction*. [Deals with the chemistry and brief description of thermic, electro and hydro metallurgical processes. A discussion of costs is also given].—Mg. Mag. July 1916; p 15; pp 5; 50c.

Assaying

Gudgeon, C. W.—*The Scheelite Gold Mines of Otago, New Zealand*. [Several properties are described. In each the ore body, milling process and milling and mining costs are dealt with].—Proc. Aus. Inst. M. E. No. 21 1916; p 37; pp 14*; 65c.

Matheson, A. M.—*Notes on the Chemical Assay of Tin Ores*. [Discussion of the chemical and fire assay of pyritic tin ores show that mill losses can not be estimated by vanning and the fire method].—Proc. Aus. Inst. M. E. No. 21 1916; p 1; pp 7; 65c.

METALLURGY

Electrometallurgy

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Improvement in the demand for copper has continued since our last report. Business has emanated principally from foreign consumers. Large producing companies report that sales consummated since the first of the month aggregate fully 30,000,000 lbs. While business has been of a nature that would under ordinary circumstances be productive of a general revival in copper demand, trade factors assert that domestic business may be withheld for another month, as home consumers are generally well covered for the third quarter. Orders have come mainly from France and Italy and involve the shipment of electrolytic over the remainder of the year. While producers have not announced the prices at which the foreign business has been taken, it is understood that the sales were made at prices ranging from 24 $\frac{1}{2}$ to 25 cts. free alongside ship. The advent of copper buying on a large scale brings to a close the protracted period of inactivity which had its inception late in May. For over two months the market has been dull, but withal prices have been maintained, although the current values are several cents under the high points reached in the last buying movement.

The position of the red metal is all that can be desired. Domestic manufacturers who overbought last spring have liquidated their excess holdings and the market is shaping for a general revival in activity which, however, may not fully materialize until the fourth quarter. As has been pointed out in these reports, the future of copper depends greatly on the continuance of the war. Now that it is certain that hostilities will prevail over the coming winter, the pessimistic talk is not so strongly in evidence.

Producers are well sold up to Oct. 1 and have large orders running into the first quarter of next year. Electrolytic for August and September is scarce and commands a slight premium, resellers asking 26 $\frac{1}{2}$ @27 cts. For October producers are offering at 26@26 $\frac{1}{4}$ cts., with November quoted at 25 $\frac{3}{4}$ cts and December at 25 $\frac{1}{2}$ cts. There appears to be no disposition to offer copper for the first quarter of 1917, but it is stated that with the next buying movement a considerable business will be done for delivery next year.

That the copper market has finally reached a firm basis at around 26 cts. for the fourth quarter is generally admitted. Some large wire drawers and brass makers have intimated that they would be buyers at 24 cts., but it is not likely that they will receive this low price, in view of the advent of foreign demand, which adequately fills the gap occasioned by

the slow domestic business. Spot casting copper is held at 25 cts., with forward deliveries quoted at 23 $\frac{1}{2}$ @24 $\frac{1}{2}$ cts.

The London market has been devoid of any feature in the interim. Electrolytic has declined £1 to £124 in the past few days, while standard copper, after breaking £1, has recovered 10s. It is reported that the English government has been selling to users at £121, which would be about equivalent to the current market here.

Quotations for copper per pound at New York for the week ended Aug. 9 were as follows:

Aug.	Date	(For Third Quarter Delivery.)		
		Lake.	Electrolytic.	Casting.
3.....	24 $\frac{3}{4}$ @25 $\frac{1}{4}$	24 $\frac{3}{4}$ @25 $\frac{1}{4}$	24 $\frac{3}{4}$ @25 $\frac{1}{4}$
4.....	25 @25 $\frac{1}{2}$	25 @25 $\frac{1}{2}$	24 $\frac{3}{4}$ @25 $\frac{1}{4}$
5.....	25 @25 $\frac{1}{2}$	25 @25 $\frac{1}{2}$	24 $\frac{3}{4}$ @25 $\frac{1}{4}$
7.....	25 $\frac{1}{2}$ @26	25 $\frac{1}{2}$ @26	24 $\frac{3}{4}$ @25 $\frac{1}{4}$
8.....	25 $\frac{3}{4}$ @26 $\frac{1}{4}$	25 $\frac{3}{4}$ @26 $\frac{1}{4}$	25 @25 $\frac{1}{2}$
9.....	25 $\frac{3}{4}$ @26 $\frac{1}{4}$	25 $\frac{3}{4}$ @26 $\frac{1}{4}$	25 @25 $\frac{1}{2}$

Quotations for copper per ton at London for the week ended Aug. 9 were as follows:

Aug.	Date	Standard		Electrolytic.
		Spot.	Futures.
